LONDON. Not the chief city of Britain in early days, but gradually assumed importance after 1000. St. Albans and Colchester were capital centers in Roman times. After Boadicea sacked the city in 61, the Romans built a wall about London, a few remains of which are visible today as the earliest landmark extant. About 368 the Romans made it a place of administration. In 597 Augustine, sent by Pope Gregory to Christianize the Britons, established his seat at Canterbury, but a bishop resided in London in 604. London suffered much from the Danes in the 9th and 10th centuries. Norman influence entered with Edward the Confessor in 1042, and William the Norman became king of England in 1066, at which time a new era began. William built the Tower as a fortress, granted London a charter, and raised the city to shire importance. The Middle Ages saw the rise of the power of the mayor of London, who still has honors and dignities, which even the king himself must respect. A bridge was built over the Thames in early days, another in 1176, and the present one shortly after 1800. By 1600 within the old city proper there were some 100,000 people. Friars from the 13th century, trade guilds from the Middle Ages, and merchants of the Hanseatic League from 1157 influenced the growth of the city. The plague of 1666 carried off about 100,000, and the great fire that followed in 1667 burned over 1300 houses and 19 churches. Then London became a city of brick and stone and of wider streets, with better provisions for sanitation, lighting, and policing. St. Paul's, designed by Sir Christopher Wren, became the center of the new city, and many notable structures followed in quick succession. James II was the last king to attempt to curb the London citizens, who led in the call to William to become their monarch, just as they had in the time of King Stephen. Gas lights were introduced in 1807. With the growth of the railways, business houses, and the fashionable West End district, London rapidly in Victoria's reign became a center of world trade and statecraft. Now it is a great cosmopolitan center of the world.

LONG ISLAND, BATTLE OF. During the American Revolution, the British planned to capture Long Island, the City of New York, and keep the road to Canada open up the Hudson River. In 1776 Washington had marched to the vicinity of New York. General Howe came down from Halifax, and with other officers took Staten Island, and landed 1000 men from their ships, prepared to attack New York. Some 5000 Americans already occupied a fortified place at Brooklyn. On Aug. 27 the British closed in upon them in three divisions. The colonists lost 500 killed and wounded, and 1000 prisoners, while the British lost but 367. By night General Washington with his force arrived, but the British did not attack, and so Washington withdrew to Manhattan Island to protect the City of New York.

LONG PARLIAMENT. Following the three weeks of the Short Parliament, on Nov. 3, 1640 the Long Parliament began its session. This body repealed various acts of its predecessor, tried and executed Strafford and Laud, abolished the Star Chamber, prohibited taxation without consent of parliament, and insured the session against premature dissolution by the authorities. Later Colonel Pride "purged" the Parliament of 96 members distasteful to the army. The remainder, known as the Rump Parliament, continued until Richard Cromwell proved he was not the man to succeed his father. Some 90 out of the original 150 continued to sit until General Lambert again turned them out. Once more they returned, but, having provided for a general election, the Long Parliament dissolved itself on March 16, 1660.

LONGSTREET, JAMES (1821-1904). Confederate general, who served with distinction in the Mexican War, was severely wounded at Chapultepec in 1847, and was brevetted major. After serving in Texas until 1858, when he became paymaster, he resigned in 1861, and entered the Confederate army as a brigadier general. He served gallantly in the first battle of Bull Run, in the Northern Army of Virginia, at Gettysburg, and at Richmond, where he was wounded. He was United States Minister to Turkey, 1880-1881, and Railroad Commissioner from 1898 to 1904.

LORENZO, THE MAGNIFICENT. See *Medici*.

LOUISBURG. (1) June 16, 1745. After a siege of six weeks, during King George's War, the English colonies in America captured Louisburg, on the east coast of Cape Breton Island, from the French. In 1748, by the treaty of Aix-la-Chapelle, Louisburg was restored to the French. (2) In 1758, during the French and Indian War, Louisburg was again besieged by the British, and after a few weeks of bombardment was obliged to capitulate.

LUCULLUS, LUCIUS LICINIUS (*c.* 110-56 B. C.). Roman general and patron of the arts, was with Sulla in Greece and Asia in 88. While Sulla attacked Athens, he drove Mithridates from the Mediterranean by his great victory at Tenedos. After ruling in Cilicia, he went against Tigranes in Armenia to whose protection Mithridates had fled. In 70 Lucullus set out to punish Tigranes, laid siege to his new capital city in 69, and dispersed the inhabitants. Later failures in the campaign in Asia Minor led to his replacement by Pompey. After a triumph at home, he retired to his study and the enjoyment of his immense fortune. He had a large library, wrote a history in Greek, and is one of the speakers in Cicero's *Academica*.

LUDENDORFF, ERICH (1865-1937). German general, who was born near Posen, and early entered the army. In 1913 his proposal for an immense war budget was passed by the Reichstag, except that three extra military divisions were not included as proposed. He took the citidel at Liége early in the World War, next went to the eastern front, where he became chief of staff and won victories at Tannenburg and elsewhere, and then returned to organize the 1918 offensive on the western front. After the war his popularity declined, partly because he favored the return of the old regime, even the monarchy perhaps.

LUNDY'S LANE. On July 25, 1814, a battle was fought on Lundy's Lane, near the Niagara Falls, between the British army led by Drummond and the

Americans under Brown. The fighting began at sunset and continued until midnight. The British were driven from their position and their artillery captured. They tried repeatedly to regain their guns but failed, and finally about midnight both armies retired from the field. Also known as the Battle of Bridgewater, or Niagara.

LUXEMBURG. A grand duchy between France, Belgium, and Prussia, the first territory to be invaded by the Germans in the World War on Aug. 2, 1914. Grand Duchess Marie-Adelaide protested in vain. In 1918 the United States soldiers were invited to restore order in the territory, and when they were withdrawn the grand duchess abdicated. After a few days as a republic, a plebicite decided that the people wished to remain as before, and Charlotte, a sister of Marie-Adelaide, became grand duchess. Luxemburg was admitted in 1920 to the League of Nations. In 1924 five chambers for artisans, traders, farmers, employees, and workers were set up, and these have power to propose laws to the chamber of deputies. After 1924 customs affairs were merged with those of Belgium.

LYCURGUS. A Spartan lawgiver who lived in the ninth century B. C. and was the son of Eunomus. He introduced a constitution and established a new social order in Sparta inuring the people to hardships and developing a nation of warriors (884 B. C.). He exacted a promise from the people not to change any of his laws until his return from a pretended visit, then went away from Sparta forever. His institutions were abandoned by the Spartans in 188 B. C.

MACCABEES. Antiochus Epiphanes, king of Syria, attempted to replace the Jewish worship by Greek rites. An aged priest, Mattathias Maccabeus, refused to sacrifice in the foreign manner, killed a Jew who was planning to carry out the royal decree, and fled to the mountains. He collected a force and began a war of liberation. He died late the same year, 168 B. C., leaving the task to his five sons. Judeus overthrew several Syrian generals, and even the regent himself, who in 162 promised the Jews religious freedom. The land prospered under Judeus Maccabeus, who now determined to free the Jews from all foreign domination. He and three brothers in turn were sacrificed in the struggle. Simon's third son, John Hyrcanus, established prosperity and peace during the rest of his brief life. Aristobulus, son of John Hyrcanus, lived but a year as king, and several weak leaders followed, until Mark Antony put an end to the dynasty in 37 B. C.

McCLELLAN, GEORGE BRINTON (1826-1885). United States general, who was brevetted captain in the Mexican War for bravery, became a major general in charge of the Army of the Potomac, and in 1862 commander-in-chief of the Northern armies. He spent a winter getting ready for a campaign, was successful in some minor battles, but was superseded by Halleck because of delays in his plans. When General Pope suffered defeat in the second battle of Bull Run, McClellan was again put in charge of the armies. Having pursued Lee into Maryland, he fought the battle of Antietam, which was either a draw or a Federal victory, but dissatisfaction again caused him to be displaced, this time by General Burnside. Lincoln and the Secretary of War always insisted that McClellan did not follow any energetic plan. In 1864 the Democrats nominated him to run against Lincoln. He was chief engineer of docks in the City of New York, 1870-1872, and governor of New Jersey, 1877-1881. He defended his campaigns of the Civil War in *McClellan's Own Story*. His son, of the same name, was mayor of New York 1904-1909, and afterwards professor at Princeton.

MACDONOUGH (*măk-dŏn'-ō*), **THOMAS** (1783-1825). He was the son of an officer in the Revolution and in 1800 joined the Navy. For several years he was on patrol duty in the Mediterranean, and helped in the bombardment of Tripoli. In 1812 he was ordered to protect the Great Lakes between United States and Canada, especially Lake Champlain. Here on Sept. 11, 1814 he defeated a flotilla of British craft under command of Capt. George Downie, and so saved Vermont and New York from further annoyances. The British had 16 ships carrying 92 guns, the Americans 14 carrying 86 guns. Both Vermont and New York rewarded him, and Congress gave him a gold medal.

MACEDONIA. Now divided between Greece, Yugoslavia, and Bulgaria, but before the World War dominated by Bulgaria and Turkey. After the death of Philip of Macedon, the district became part of the Eastern Roman Empire in 146 B. C. Various invasions had few permanent results, until the Slavs came in the 5th century, even then the coasts remained largely Greek. Macedonia was part of the first Bulgarian empire in 892, independent in 963, then again under Bulgaria, and in 1014 became part of Byzantium. The kingdom of Thessalonica dominated from 1204 to 1230, then the Bulgars again, in part, and in part Byzantium. In 1371 the Turks became powerful, with other races coming in from time to time, especially the Bulgars. In recent decades Turkey was warned to institute reforms, down to the War of 1912-13, when part of Macedonia went to Bulgaria, Greece, and Serbia. In 1919 Greece and Yugoslavia received territory at the cost of Bulgaria, including western Thrace awarded to Greece.

MACKENSEN (*măk'ĕn-zĕn*) **AUGUST VON** (1849-). German military leader, was born in Haus Leipnitz, Saxony; entered the army in 1869; served as lieutenant of reserve during the Franco-Prussian War, 1870-71; promoted to general staff, 1882. During the World War, in 1916, he was one of the leaders in the victorious campaigns against the Russians; was made field marshal and commanded the Teutonic armies which defeated Serbia and Rumania. Was a prisoner of the French for several months after the Armistice. Became one of the popular military idols of Germany, prominent in the Nationalist Party.

MacMAHON, MARIE EDME PATRICE MAURICE (1808-1893). He commanded the forces that stormed the Malakoff in 1855 in the Crimean War, gained fame in Algeria, in the Italian campaign, and was made governor of Algeria in 1864. For pushing ahead and saving the day in the battle of Magenta (1859), when 55,000 French and Sardinians defeated 75,000 Austrians, he was made Duke of Magenta and a marshal of France. In the Franco-German War, he fought at Worth, at Sedan was dangerously wounded, and was interned at Wiesbaden. In 1871 he suppressed the Communist insurrection and carried forth the second siege of Paris. On the resignation of President Thiers, 1873, he became second president of France by an almost unanimous vote. In the struggles of the next few years between the Republican party and the others, MacMahon continued to hold the confidence of the majority party, until the Republicans sought the removal of officials opposed to them. Then MacMahon resigned on Jan. 30, 1879. He was descended from an Irish family which took refuge in France along with James II of England.

MAGNA CHARTA, THE. The Great Charter, said by Hallam to be the "keystone of English liberty," was granted by King John to the Barons at Runnymede (1215). The charter contains 63 clauses, and is partly remedial and partly "declaratory of the principal grounds of the fundamental laws of England." Its principal provisions are: (1) Security for personal freedom: "No free man shall be taken or imprisoned or dispossessed or outlawed . . . save by the judgment of his peers or by the law of the land"; (2) feudal obligations defined and limited; (3) law courts to be held at fixed places, assize courts established, and justice no longer to be sold, denied, or delayed; (4) no extraordinary taxation without consent; (5) one standard of weights and measures; (6) independence of the Church provided for. King John signed under compulsion after hesitating four days. He sought to avoid carrying out some of the provisions. At the time of his death on Oct. 19, 1216, he was preparing to engage French mercenaries to fight against the barons of England. The Magna Charta was reaffirmed 32 times by succeeding kings. Its original draft has become lost, but four early copies are preserved, one in Lincoln Cathedral (the most perfect), one at Salisbury, and two in the British Museum. The text found in the Revised Statutes of England is that of the time of Edward I, 1297.

MAMELUKES. The word in Arabia means white slaves purchased in the open market or taken in war. About 1250, the grand-nephew of Saladin, Ayyub, then ruling in Egypt, imported Turkish slaves from Asia Minor and used them as royal guards. After the death of the sultan, the Mamelukes elected an emperor from their own number, and ruled until 1517 when the Ottoman Turks gained control of Egypt. Selim I, Turkish emperor, to conciliate the Mamelukes, made some of them beys (governors) of

twenty-four military provinces. They became virtually independent after 1700. Napoleon defeated them in the battle of the Pyramids on July 21, 1798, and drove many of them into Nubia. Other massacres of the Mamelukes occurred at Cairo in 1805, and in all Egypt in 1811, the last through the treachery of Mehemet Ali. By 1820 few were left in the entire country. These people were remarkable for their skill in organization, strategy in war, and patronage of arts and letters.

MANCHUKUO. In 1932 three eastern provinces of China,—Fengtien, Kirin, and Heilungkiang,—which had been known as Manchuria, withdrew from the empire and set up an independent government, first as a republic, then as a monarchy. Henry Pu-Yi, who was deposed as emperor of China in 1912, became in 1934 the new ruler under the name of Kang Teh. The new government was called Manchuchuo or Manchukuo, or, in the native language, Ta Manchu Tikuo, meaning great empire of the Manchu. Racially the Manchus are related to the men of north China, and to some Indian strains on the North American continent, suggesting some early migration to what is now Alaska and Canada. The Manchus took China after 1500 and ruled there until 1912. Russian influence in this area began about 1600, and in 1858, again in 1860, some territory north of the Amur River went to Russia. Encroachments of Japan in the Liaotung peninsula and about Port Arthur were the causes of the war between Russia and Japan in 1904. In 1915 Japan secured a long-term lease to railway concessions in Manchuria, but later the Soviets for a time checked the ambitions of Nippon. In 1935 Manchukuo purchased the Russian interest in the lines of the Chinese Eastern Railway within the borders of the new state, the cost of nearly $50,000,000 being guaranteed by Japan. Chinese were appointed to all important positions, but with a Japanese adviser back of every official. On the claim that Manchukuo was in danger from the north provinces of China, Japan overran Jehol in 1933 and added this territory to Manchukuo. Again, 1935, Chehar, another province, was established as a demilitarized zone.

MANDATES. According to Roman Law, these mean gratuitous agencies; a task undertaken without hope or promise of reward or payment. Article 22 of the Covenant of the League of Nations establishes mandates over certain areas. These could not be annexed by a victor nation, nor could they go back to the old sovereignty. In cases tried before, as to Samoa and New Hebrides, for instance, other plans had failed. Hence, Gen. Jan Smuts of South Africa proposed the plan adopted for the mandates under the League, which has thus far been scrupulous to supervise the conditions of the mandated territories, even to the extent of carefully auditing accounts submitted by nations holding the mandates. Something of this general nature was tried in Lebanon (1860), Samoa (1887), Crete (1898), Manchuria (1905), and Morocco (1906).

The Lausanne Conference in 1923 gave mandates over former German and Turkish possessions as stated below. *Class A,* virtually independent districts,—Iraq, Palestine, including the transjordan country, to Great Britain; Syria and Greater Lebanon to France. *Class B,* needing much supervision, —Togoland to Great Britain and part to France, as also the Cameroons; Tanganyika to Great Britain; Ruanda-Urundi to Belgium. In 1929 Great Britain proposed that Iraq be made an independent state, and the plan was approved in 1932, when the mandate ceased. *Class C,* territory needing some protection,—West Samoa to New Zealand; Nauru (phosphate island) to Great Britain, Australia, and New Zealand jointly; New Guinea, to Australia; Pacific islands, to Australia; North Pacific islands to Japan. See article on *British Empire.*

MANGIN, CHARLES EMMANUEL (1866-1925). French military man, who spent 22 years in Africa, became a general of brigade in 1913, engaging in several operations in the Black Continent, which he described vividly in his *La Force Noire.* During the World War he held important commands, throwing the enemy back before Douaumont and Vaux, practically checked the Germans at Campiegne, and helped break the lines south of the Aisne. Later he commanded the army of occupation on the Rhine, was a member of the Supreme Council of War, and president of the Council for National Defense.

MANILA BAY. Decisive battle of the world (1898). A victory of superb audacity by the American Pacific fleet under Admiral Dewey over the Spanish fleet under Admiral Montojo. On paper the fleets were nearly equal; in individuality and efficiency as wide apart as the poles. Dewey daringly drove in past the forts and torpedoes, relying on Spanish inefficiency; fought the Spaniards until every vessel went down fighting, and, without losing an American ship, annihilated Spanish rule in the Pacific, bringing the Philippines under the rule of United States. Opposed by a land force of 10,000 Americans, the city of Manila surrendered August 13.

MARAT (*mah-rah*), **JEAN PAUL** (1744-1793). French author, revolutionist, and denouncer of the Girondists. Previous to 1788 he wrote several medical, scientific, and philosophical works, including *Philosophical Essay on Man* and *The Chains of Slavery.* After receiving a medical degree from Edinburgh, he enjoyed a huge practice in Paris. After various attacks on persons in power in his newspaper *The Friend of the People,* he had to flee to London in 1790. Later in Paris he was compelled to hide in obscure haunts, sewers, and cellars to escape the police. In 1793 he denounced the Girondists, the chief party then in power, but was acquitted after they had him brought to trial. This move lost the Girondists their hold on Paris. Gaining access to his lodging by a ruse, Charlotte Corday stabbed him to death on July 13. She thought her mission was to save France.

MARATHON. Plain about 24 miles northeast of Athens, where one of the great battles of the world was fought. It was a struggle between the civilizations of the east and the west; liberty and progress against the backward standards of the orientals of ancient times. If the Persians had won at Marathon, the whole history of Europe might have been quite different. Darius, king of Persia, ordered his generals to "enslave Athens and Eretria and bring the slaves into his presence." So Herodotus testifies. After Eretria fell the Athenians dispatched a runner, Pheidippides, to Sparta for help. Miltiades, acting under Callimachus, marched out from Athens to delay the enemy and to wait for the Spartans and the Plateans. The former arrived too late, but Platea furnished 1000 to add to the 9000 from Athens. Callimachus decided to attack, the date being Sept. 21, 490 B. C. The Greeks thinned out their line to equal that of the Persians, and to strengthen the right where Callimachus was, and the left where the Plateans stood their ground. The Greeks met the attack on a run, and the center was thrown back, allowing the wings to come in and roll up the Persian flanks, after which the Greeks caught the center lines of the enemy. The Greeks pursued the retreating Persians to the water-edge, fired seven of their galleys, and here suffered their chief loss, the death of Callimachus. The Greeks lost 192 men slain; the Persians 6400. Despite this, the invaders tried to attack Athens by water, but Miltiades marched at night across the hills, and in the morning the Persians withdrew when they saw the conquerors on the heights above the city, together with the hosts of Sparta, then just arrived.

MARCELLUS, MARCUS CLAUDIUS (c. 268-208 B. C.). Roman general, who was five times consul, and was called the "sword of Rome." With Cornelius Scipio he defeated the Gauls and slew their chief, during his first consulship in 222 B. C. In 216 B. C. he prevented some of the towns from falling into the hands of Hannibal, and took Syracuse in Sicily after a siege of two years, while devices made by the mathematician Archimedes held him at bay. Later he took Salapia in Apulia, which had gone over to Hannibal, fought with the Carthagenians near Venusia, and during his fifth consulship was killed by ambush while reconnoitering. Highly praised by the historian Livy.

MARENGO, BATTLE OF. Between this place and Alessandria, Italy, Napoleon gained a great victory over the Austrian army under Baron Melas on June 14, 1800. Two days before, unable to locate the Austrians, Napoleon had sent out detachments to look for the enemy. While the French were thus weakened in numbers, the Austrians appeared from the fortress at Alessandria, drew up their cavalry in a favorable spot north of Marengo, and after several hours had about defeated Napoleon with heavy casualties. Late in the afternoon, one of the scouting divisions returned, the lines were solidly formed, and all moved forward together. The Austrian loss was 9500 to 4000 of the French. All Italy south of the Mincio was surrendered to Napoleon.

MARION, FRANCIS (1732-1795). American soldier; born at Winyah, near Georgetown, S. C. Took part in the defense of Fort Moultrie, and participated in the unsuccessful attack on Savannah (1779). Governor Rutledge made him brigadier general of the state forces in South Carolina. Sat in the South Carolina Legislature (1782-1790), and was a member of the Constitutional Convention (1790).

MARIUS, GAIUS (155-86 B. C.). Of obscure origin, he rose to the rank of commander of the armies of Rome, and was seven times consul. He tried to curb the power of the nobles, who kept him from office until after he married the aunt of Julius Caesar. He fought in the war against Jugurtha, came home to be elected consul, and raised a large army from those who had no property. With the quaestor Sulla, he conquered Numidia, but later quarreled with his colleague. After his fifth election as consul, he associated with demagogues, and was forced to leave Rome for Asia, where he hoped to wage a war against Mithridates. Later he joined Cinna, took Rome, and put to death scores of the patricians. Three weeks after being again elected consul he died of fever.

MARLBOROUGH, JOHN CHURCHILL, DUKE OF (1650-1722). English commander; born at Ashe in the Parish of Musbury, Devonshire. Was made a colonel of foot in the English army (1678); commanded English forces in Ireland (1689); and through court influence, and unquestioned ability rose rapidly to high rank. Aroused much suspicion after the coronation of William III. (1689) by supporting alternately both William and James II. In the war of the Spanish succession Marlborough and Prince Eugène led the allied forces which won victories at Blenheim (1704), Ramillies (1706), Oudenarde (1708), and Malplaquet (1709).

MARMONT, AUGUST FREDERICK LOUIS VIESSE DE (1774-1852). French marshal and Duke of Ragusa, who fought with Napoleon at Lodi, in Egypt, and at Marengo in 1800, after which he became general of a division. He pursued the enemy in 1809 after the battle of Wagram, and after winning the battle of Znaim was made a marshal. For 15 months he kept Wellington from carrying out his plans, but was defeated at Salamanca in 1812. After several battles, he decided that resistance was useless, and so he concluded a truce with the allies, the result being the abdication of Napoleon. In 1830 he assisted in the attempt to suppress the Revolution, but failed, lost support of the people completely, and afterward lived abroad.

MARNE, BATTLES OF THE. On Sept. 4, 1918, when the German advance had reached a point dangerously near Paris, General Foch ordered the Allies to make a stand at all costs. Unexpectedly, the next day the battle began when the French VI Army contacted part of the forces left in position by General von Kluck. During that night the Germans withdrew to a position several miles in the rear. The battle continued until Sept. 9, with the I, II, and III German Armies retreating at the end. The IV and V Armies remained several days longer. In the battle along the Ourq, on the Paris front, the VI French and German I Army came into conflict, and then General Galliéni ordered all Paris taxicabs to transport soldiers to the front. Meanwhile, at first the British found in front of them only German cavalry, and the V French Army only cavalry. Various shifts were made by the Germans, until on Sept. 9 the II Army was withdrawn, and then the British advanced, while later the German I and III Armies were forced back. The German IV and V, already just entering the battle, were obliged to follow. Thus, when the Germans retreated, the first great battle of the Marne ended with decided advantage to the Allies, for Paris was saved, and new spirit of resistance entered into the forces of the defenders.

At the end of the World War, the second great battle of the Marne involved the best German troops, 800,000, commanded by the Crown Prince in person, on a front of 60 miles. The Germans aimed to capture Rheims again, and force the French out of the Champagne sectors. Here, on the first day of the battle, July 15, the Americans entered the lines in numbers at Château-Thierry. The French under General Gourand held their lines, with terrible cost to the Germans, with the 42. American Division forming part of the defense. After July 17 the Allies took the offensive, and the Germans were gradually forced backward toward the Belgian frontiers.

MARSTON MOOR, BATTLE OF. Here on July 2, 1644 seven miles west of York, England, the Royalists under Prince Rupert were decisively beaten by the Parliamentary and Scottish forces under the earl of Manchester, Lord Fairfax, and Lord Leven. The Royalists numbered about 18,000, and the Parliamentarians some 27,000. During the day spasmodic firing continued, with neither army, which faced each other, advancing. Prince Rupert and other Royalists withdrew, thinking no battle would result until morning, but the forces of Cromwell attacked at five o'clock, and took the government troops off guard. The Royalist cavalry, known for never being defeated, could not hold out, but Rupert brought up fresh reserves. The king's forces penetrated the Scotch line held by Lord Leven, who personally withdrew, but Fairfax, Cromwell, and Leslie scattered the royal horsemen, and at last the forces of Rupert were nearly surrounded. By fall of darkness, the Royalist army was scattered and crushed. Rupert escaped with 6000 men, but the northern army of the king was never powerful again.

MASON AND DIXON'S LINE. The boundary line between the states of Maryland and Pennsylvania as run by two distinguished English surveyors, Charles Mason and Jeremiah Dixon, in the years 1763-1767. The line settled a dispute between the two states over their respective boundaries as described in their charters. Before the Civil War, the phrase, "Mason and Dixon's Line" was used to indicate the dividing line between the free and slave states, and at present the term continues to be used to designate the dividing line between the South and North. A re-survey of the line was authorized by Pennsylvania and Maryland in 1849, and again in 1900. Under the Missouri Compromise of 1820, the line was said to extend westward in the Louisiana Purchase, except for an adjustment in Missouri.

MAURICE, COUNT OF NASSAU (1567-1625). Second son of William the Silent, who was assassinated in 1584. Maurice was made stadholder of Holland and Zeeland, two provinces that had been paying his expenses at the University of Leipzig, but he took little part in public affairs until after he was made a prince in 1586. Johan van Oldenbarneveldt, 1587, became chief statesman of the Netherlands, and so continued for over 30 years, while Prince Maurice commanded the army. They worked together in securing the independence of united Netherlands from Spain, defended Ostend for three years, and became master of military tactics. In 1609 the Spaniards were compelled to sign a truce, but Maurice opposed this, and from then on he and Oldenbarneveldt fell on opposite sides of questions of state and religion. Maurice had a part in illegally condemning Oldenbarneveldt to death. He never prospered after that. On the death of his elder brother in 1618, he became prince of Orange.

MAYFLOWER. Ship in which the Pilgrims left England for the New World. It was of about 180 tons burden, and was accompanied from Southampton, England, by the *Speedwell* which had to put back after two trials at sea. Of the original 120 passengers on both ships, 102 of these came on the *Mayflower* alone. The *Mayflower* left Plymouth finally on Sept. 6, arrived off Provincetown Harbor, Mass., about Nov. 11, and there the members on board signed a compact to govern their affairs on land. William Bradford with a small party explored the coast, and finally chose Plymouth, where they landed on Dec. 11 (Dec. 21 in our present calendar), 1620. During the first winter half of the colonists died of exposure, famine and scurvy. In 1894 a General Society of Mayflower Descendants was formed to which any person over 18 who can prove descent from a *Mayflower* passenger is eligible. Various states have also their own local branches. See *Plymouth Colony* and *Peregrine White*.

MAZZINI (*mat-zé-nee*), **GIUSEPPE** (1808-1872). An Italian patriot, educated for the law, and imprisoned because he joined the Carbonari, a society designed to secure Italian unity. Then he was released for want of evidence, cast his lot with the Young Italy group, and for several years lived at Marseilles and London. In 1848 he returned to Italy, was a member of the brief Tuscan independent government, and later of the assembly at Rome after the revolt there. For a time in 1849 he was one of the triumvirate who ruled the city, but the French put an end to dreams of Roman freedom. Mazzini returned to London, continued to agitate, and helped plan the insurrections in Mantua, 1852,

Milan, 1853, and in Genoa, Leghorn, and Naples in 1857. Having returned to Italy, he was sentenced to death; and, in protest, Messina several times elected him to Parliament, but he refused to take his seat. The death sentence was withdrawn in 1866. He encouraged Victor Emmanuel and Garibaldi, and in 1870 was imprisoned for two months in Sicily. In his last days he endeavored to unite Italian workmen for their own good. When Italian unity was achieved, the attitude toward Mazzini changed, and Parliament unanimously expressed national sorrow when he died in 1872. He was buried at Pisa, and later removed to Genoa, his birthplace.

MEADE, GEORGE GORDON (1815-1872). Distinguished American general, born of American parentage at Cadiz, Spain, educated at West Point, and spent his life after 1835 in the army, except for the years 1836 to 1842, when he engaged in railway construction as an engineer. He gained special distinction in the Mexican War, became a brigadier general of volunteers in 1861 in command of troops from Pennsylvania. He was severely wounded but recovered in time to engage in the second battle of Bull Run. For great skill in command, he was made a major general of volunteers after the battle of Chancellorsville, and on the eve of Gettysburg superseded Hooker. For stemming the tide of the Confederates, he was made a brigadier general in the Federal army, and later a major general on recommendation of Grant, who gave him important duties. After the war he commanded various army posts.

MECCA. Ancient city of Arabia, and since 1926 the religious capital of Saudi Arabia, or the kingdom of Hedjaz and Nejd. The great Hegira is the flight of Mohammed from Mecca in 622, but he returned and conquered the city in 627. After changing allegiance several times following invasions, Mecca was ruled by the Egyptians and Turks from 930, until the Arabian Wahhabis conquered the city in 1803. Hussein-ibn-Ali was grand sherif, and real ruler of Mecca, when independence was proclaimed in 1916. On March 7, 1917, he proclaimed himself King of Hedjaz to the Faithful. Mecca retains her ancient character of a sacred shrine, still visited by from 50,000 to 100,000 pilgrims yearly. The great center of interest is the Grand Mosque, with its court capable of holding 35,000 persons at once. Within this enclosure is the sacred Kaaba, which was a heathen shrine long before the time of Mohammed. At one corner, high enough for kissing, is the talismanic Black Stone, venerated by all true Islamites. There is also a holy Southern Stone, which all faithful touch as they go by in procession. Another enclosure, according to tradition, contains the graves of Hagar and Ishmael.

MEDICI, THE. See *Rulers* and *Statesmen*.

MEDINA. Next to Mecca the most sacred city of Islam, since this city contains the tomb of Mohammed and was his residence during the period of his flight or Hegira from Mecca (622-627). In succession Medina was ruled by the caliphs, by native emirs, Egyptians, Turks, and from 1804 to 1912, by a native tribe, the Wahhabis. Until 1916 the entire territory was in control of Constantinople. In 1912 Ibn Saud, a powerful native emir, began to dominate. During the World War, Emir Faisal besieged Medina, but the Turks made a sortie, and a bloody battle was fought on the plains outside. Then they retreated into the sacred enclosure, declaring that they would destroy the tomb of Mohammed before they would surrender. By the peace treaty, however, on Jan. 1, 1919, Medina was delivered over to King Hussein of the Hedjaz, and Turkish sovereignty ceased. The chief building of Medina is the Prophet's Mosque, within which is the tomb of Mohammed, said to be placed on the spot where the founder of Islam fell. None save Mohammedans are admitted to the sacred shrine.

MERRIMAC, THE. See *Monitor*.

METAURUS. Decisive battle of the world, in which Hasdrubal, brother of Hannibal, was defeated by Caius Nero and Marcus Livius (207 B. C.). Along the shores of the Adriatic, near Rimini, Hannibal's brother led his varied host from the Pyrenees, Rhone, Alps, and Po, to help the great Carthaginian crush the growing power of the Roman Empire, and make Punic power supreme. Rome stood at bay for eight years, Hannibal finally waiting the arrival of Hasdrubal's reinforcements. The consular army of Livius harassed Hasdrubal, who proposed to Hannibal to unite the two armies in South Umbria and swing round against Rome an overwhelming force. The Consul Nero made a marvelous forced march, reinforced Livius, caught Hasdrubal in disorganized retreat, defeated him, sending his head to Hannibal as news of the catastrophe. Thus he saved Imperial Rome and broke the power of Hannibal.

MEXICAN WAR. Texas became independent in 1835, and asked to join the United States in 1836, but annexation was delayed until Dec. 29, 1845. Mexico claimed the boundaries were at the Nueces River, but the United States said the Rio Grande. Gen. Zachary Taylor was sent into northern Mexico in the hope that the country would submit. Gen. Santa Anna opposed him at Buena Vista on Feb. 22 and 23, 1847. Gen. Winfield Scott next planned a campaign from Vera Cruz to Mexico City. The former was captured after a siege of three weeks; Santa Anna was defeated at Cerro Gordo, and Taylor entered Mexico City on Sept. 13, 1847, and the Peace of Guadalupe-Hidalgo followed on Feb. 2, 1848. Meanwhile Gen. Philip Kearney had captured the territory from Texas to the Pacific, and the American fleet had blockaded the cities of both coasts. The United States paid Mexico $15,000,000 for the new territory besides Texas, and also assumed certain claims held against Mexico by Americans because of border raids.

MEXICO. The Toltecs settled in Mexico about 700, but fled to the southward when a pestilence and famine threatened to destroy the entire race in the 11th century. Next the Aztecs became influential. Both are represented by some descendants today. Mexico City dates from the 12th century, the original name being Tenochtitlan, meaning cactus on a stone. In 1521 Cortes, the Spanish conqueror, subdued Mexico City and much of the land, after which the town was rebuilt more securely. By 1540 all territory from Mexico to Vancouver Island (now in Canada) was named New Spain and was under one rule. By 1810 some 57 viceroys had governed in turn in Mexico. Then a priest named Hidalgo revolted. In 1822 Gen. Iturbide set himself up as president, but the next year Santa Anna banished him to Italy under a pension. Iturbide returned in 1823, stirred up a small insurrection, and was shot. Texas broke away from Mexico in 1835. After this disorder and civil war continued, until in 1862 the nations of Europe sent over a force. France placed Maximilian of Austria on the throne as emperor, but he was deposed and shot in 1867. Juarez again became the leader, until in 1872 began the administration of Porfirio Diaz, which continued until 1911, when Diaz was compelled to retire while serving his eighth term as president. Francisco Madeiro, who followed Diaz, was killed in 1913. Then under four presidents peace reigned until 1926. Succeeding presidents, notably Portes Gill, and Cardenas struggled with the question of a new distribution of the land to the peasants and curbing the power of the church in Mexico. Under the new constitution of 1917, Mexico has 28 states united into a federal republic, together with a federal district, and two territories.

MIDDLE AGES. A term vaguely applied to the centuries from 500 to about 1500. Some date the beginning at the fall of Odoacer, Roman emperor, in 476, and the ending, at the fall of Constantinople in 1453. Others place the last limit at the discovery of America, or the Renaissance, or the reign of Henry VIII in England, or the rise of the new Scholasticism. The Middle Ages were characterized by a desire to conserve the past, to follow established authority in both state and church. Civil government and science both received set-backs, though Charles the Great (Charlemagne) fostered both. Even after the Roman empire died out, the system of its success was adopted in the church and newer nations. The German tribes continued to push westward, and the Mohammedans into southeastern Europe and into Spain. Offsetting these were the Crusades, the rise of modern nations like the English, Franks, and Spanish. Feudalism reached its height and rapidly began to decline. When the church assumed more power, schools and systems of thinking underwent remarkable changes, but scholastic thought became rigid and uncompromising. Cities began to grow more numerous, people more independent and progressive, and democratic institutions at last gathered strength. So the Middle Ages were fruitful, even though progress was somewhat retarded.

MIGRATIONS. Climate and commerce have brought about migrations of tribes and nations. The

Teutons went into Gallia when the sea destroyed their homes in Jutland. Many of them crossed to Britain after the Romans lost their hold there in 449. Vikings went from Norway to Iceland and Greenland, then fairly warm, before 1100. Later the Eskimos came down from the north and replaced them in Greenland. Many say that the American Indians came across Bering Strait to America. Some think the regions around the Baltic once supported the people who were driven southward by the cold, and some settled in Greece. The Celtic peoples spread over Europe and much of western Asia in early times. Likewise the Teutonic tribes pushed into Italy, and also to the westward. The Huns came from the southeast, perhaps from central Asia. Last of all, the Lombards completed the Germanic migrations into Italy. Under Alaric the Visigoths or eastern Goths found a home in southern Gaul and in Spain. The Moors from northern Africa long occupied parts of the Spanish peninsula. Other tribes that invaded Europe from Asia were the Bulgars, Huns, and Scythians.

When central and eastern Asia became dry and arid, the tribes moved westward. Of such were the Kassites who invaded Babylonia, the Hyksos who invaded Egypt, with their goods, and brought the horse with them, the Hebrews who went to Egypt in times of famine. Into Syria came the Arameans from the north, and the Hittites from the south. The domestic animals were carried from central Asia westward. It is said by some that the Philistines came into western Asia from Crete. Many other early migrations took place before the settlement of America, and the great moving of peoples by recent emigration. The trek of the Boers in south Africa is one example of modern migrations by large groups, as in ancient times.

MILES, NELSON APPLETON (1839-1925). American general, who served in the army of the North at Antietam, Fredericksburg, and Chancellorsville, where he was wounded severely. He returned to duty in 1864, and for gallantry in the battle of the Wilderness was made brigadier general. After the war he rose by successive promotions to commanding general of army in 1895. In 1900 he was made lieutenant general. He won great success in putting down Indian uprisings, such as the Cheyenne, Kiowa, and Commanche in 1875, the Sioux of Montana, 1876, and the Apaches under Geronomo in 1877. Miles also commanded the troops sent to Chicago in 1894 to quell the railway riots. During the war with Spain, he was in general charge of the campaign, his own part being confined to Puerto Rico.

MILTIADES (d. c. 488 B. C.). Athenian general, who was sent to the Chersonese of Thrace and helped subdue the Scythians. When the Persians appeared in Greece, he was one of the ten generals chosen to defend the country. By his advice the ruler Callimachus decided to withstand the Persians at Marathon. Then he sailed with a fleet of 70 ships to retake the Aegean Sea for Athens. After laying siege to Paros for almost a month, for some unknown reason he gave up the attempt, being wounded meanwhile trying to leap a fence. On his return home, he was impeached and fined. Some accounts say he remained in prison, not being able to pay his fine, which was raised by his son Cimon, after Miltiades had died of the hurt received at Paros.

MINUTE MEN. Popular name for the militia of the New England states at the time of the American Revolution. They were men who had been taught the mere rudiments of handling a gun, but were ready to grab a musket and go forth on a minute's notice. Late in 1774 in Massachusetts they were enrolled by an act of the congress of the province. Even before the beginning of the War, in Boston alone they numbered some 15,000. When Paul Revere and his companions set out to warn the countrymen on the road from Boston to Concord, these minute men provided the first resistance to the British regular troops or "redcoats." The men did not fight in regular order or line of battle, but from behind fences, stones, or any barrier at hand. Thus they were able to withstand even the King's picked soldiers.

MITHRADATIC WARS. Three struggles between 88 and 64 B. C. between the Romans and Mithradates VI of Pontus. They begain when the Romans objected to the aspirations of Mithradates, and particularly to his driving out the young king of Bithynia. Mithradates gained a number of great victories, but the Greeks in his conquered cities turned against him. Then the Romans under Sulla compelled him to make peace, to give back all territory conquered, and to pay a huge fine of 2000 talents. In the second war, Lucullus of Rome drove him into Armenia to the court of his son-in-law, Tigranes. Lucullus was succeeded by Pompey, when his men mutinied, and Pompey defeated both Mithradates and Tigranes in battle. In the third campaign, Mithradates won temporary success, but his men revolted; he tried to kill himself, and at last ordered his bodyguard to slay him. Though he was a great linguist, patron of the arts, and a statesman, he was cruel, and some of his unnatural deeds shocked the ancient world.

MOBILE BAY, BATTLE OF. During the Civil War, Mobile in Alabama was blockaded by northern ships, but trading vessels managed to break through. On August 5, 1864 Admiral David Farragut planned to take the forts and capture the city. He entered Mobile Bay with four monitors and fourteen small wooden vessels; but his ship, the *Tecumseh*, was soon destroyed by a torpedo explosion. The others forced their way past, captured one ironclad, destroyed a gunboat, beached another, and silenced the forts. A few days later the city fell into his hands.

MOGUL (MOHGUL) EMPIRE. Named for that branch of the Mongols which controlled India from 1525 to after the coming of the British. Babur, the young king of Kabul, first of the Moguls, subdued Delhi, Agra, and much of the Mohammedan area. Within five years before his death in 1530 he held sway from the Oxus to the borders of Bengal. His grandson ruled over more India than any man before him. This was the famous Akbar, who is even better known for three things: his wise system for renting of land, for giving the feudal native rulers a liberal share in local government, and for establishing a new religion, composed of parts of several older, established ones. Thus he satisfied all classes. His son ruled from 1605 to 1627 moved the capital from Agra to Lahore, and received the first English ambassador. Next came Shah Jehan, who beautified the city of Delhi, erected the famous peacock throne studded with jewels, and created that marvel of all Indian architecture, the Taj Mahal, where his favorite wife (for whom he built it), and he himself are entombed. Aurungzebe, his third son, supplanted three brothers, and even put his father under restraint at Agra, while he ruled in his stead at Delhi. He dominated much of India for 49 years, ending in 1707. For some time he fought against the Mahrattas, finally conquering them, or at least taking Bijapur and Golconda. The next ten rulers left little to record save their own names. In 1739, however, Nadir Shah of Persia, last great Mohammedan conqueror of India, sacked Delhi, and carried away treasures worth millions. He in turn held in check the proud Mahrattas and other native chiefs. Following him nothing particular can be said before the English came in 1857.

MOLLY MAGUIRES. About 1842 in Ireland some men, dressed up in women's clothes, intimidated landlord's agents and process servers coming to evict tenants. They were given the nickname of Molly Maguires. From 1854 to 1875 in the hard coal regions of eastern Pennsylvania, the miners were much troubled by a small, secret group, which took the Irish name, though it is doubted that they had any connection with the Molly Maguires in Ireland. They apparently sought to protect themselves against Welsh, English, and German miners. Much violence and several deaths resulted under mysterious circumstances. Later it was found that the Molly Maguires always reported their wishes to outside parties, who came and carried out the acts of violence. Thus no miner in any place could be convicted of local outrages. At last, a Pinkerton detective was summoned. He joined one of the lodges, learned the secrets, even became secretary of a criminal gang, and revealed his findings. This and other evidence led to the conviction in 1876-77 of many members of the Molly Maguires, with several executions. Little trouble occurred after that.

MOLTKE (*mol't-ka*), **HELMUTH VON** (1800-1891). German count, field marshal, and great military strategist, who was born in Mecklenburg-Schwerin. For nine years he was carefully educated in military studies, and then served on the general staff, being made a captain in 1835. In that year he was allowed to go to Asia to help organize the Turkish Army. As

chief of the general army staff at Berlin, he reorganized the Prussian military system, being largely responsible for its great efficiency between 1858 and 1888. Wars with Denmark, Austria, and France were carried to a profitable conclusion. Moltke and Bismarck laid the foundations for the modern German empire. He was made a field marshal in 1871, given a large grant of money, and retired from the service in 1888, though he held an advisory position until his death. Moltke was known as "The Silent," being a man of singular modesty and good nature. He was also a voluminous author of biography, fiction, history, and letters.

MONACO. Tiny country of about 370 acres along the Mediterranean and otherwise surrounded by France, noted chiefly for Monte Carlo, with its gaming tables, from which most of the revenue of Monaco is derived. For over nine centuries after 968 Monaco was the property of the Grimaldi family, and was ruled by princes as absolute monarchs. Since 1911 it has been a constitutional monarchy, and Louis II is prince, assisted by a council of state and an assembly of 12 members.

MONASTICISM. Also called *Monachism.* Long before Christ some form of monasticism was known among the Hindus, among the followers of Buddha, among the Greeks in the Orphic brotherhood, and among the Jews in the Essenes. Early in the Christian ages men and women abstained from marriage, meat, liquors, common amusements, and devoted themselves to prayer and service for the unfortunate. Egypt was a favorite haven for religious refugees from the Roman world. One curious early form of monachism was that of the Stylites, men who sat high on pillars to keep from the contaminations of the world. St. Anthony of Thebes (251-350) retired to the desert, with a number of his disciples, and one of his admirers founded a monastery on an island in the Nile, where a definite set of rules was formulated, first on record for monasteries. St. Basil established a system in Greece which exists today in modified form. Athanasius founded monasteries in northern Italy, St. Augustine in Africa, St. Martin of Tours among the Gauls. At the beginning of the 6th century, it was St. Benedict that gave monasticism to western Europe in its modern forms. Irish monks very early lived at Iona and Lindisfarne, where St. Columba was the pattern monk. Later the Cistercians advocated going back (about 1100) to the original rules of Benedict. The Augustinians became prominent about 1050.

Two special orders followed the Crusades: Knights of St. John, Knights Templars, and Teutonic Knights; and second the ransom orders, designated to free Christians from the power of Islam. Then grew up the four orders of the mendicants,—the Franciscans, 1210; the Dominicans, 1215; Carmelites, 1245; Augustinians, 1256. Various new congregations followed in the 13th and 14th centuries. Among the modern orders are Jesuits, founded in 1540; the Passionists, 1725; the Redemptorists, 1749, the last two fostering missions and retreats; the Christian Brothers, 1679, devoted to primary education. The Oratorians and French Oratory are orders of a temporary or secular nature, vows being taken for short periods. The Sisters of Charity, 1633, are similar for women. Joseph II in Austria curbed the monasteries in 1780; the Revolution dispersed many of them in France; Henry VIII broke up many in England after 1500; in Portugal and Spain they were mainly dissolved in 1835, in Italy in 1876, in Prussia in 1871. Modern nations having complete religious freedom, like the United States, have been favored by founders of monasteries.

MONGOLS. From earliest history the Mongols have lived in central Asia, in what is now called Mongolia and nearby lands. Their great emperor, Ghengis Khan, between 1206 and 1227 conquered much of Asia. He willed to his son Ogotai the territory between Irtish and Lake Baikal; his son Jagatai, the land from Bokhara, Gobi, and that region to the westward; to his son Tuli, the land south of Baikal; and to his three grandsons, the country drained by the Ural, Oxus, and Jaxartes. Ogotai became emperor of China in 1234, ending the Sung dynasty there. The grandsons occupied much of Russia, and what is now central Europe, in 1241, and conquered Georgia and Armenia. Tuli's son took Bagdad, displaced the caliphate, and extended his borders into Syria. Kublai Khan, another son of Tuli, set up a line of emperors in China in 1275, and ruled until 1368, when the Chinese expelled them. In 1475 the Turks regained some of the Crimea, and in 1840 the Russians broke the Mongol yoke. Ivan the Terrible of Russia took Kazan in 1552, and Astrakhan two years later. As the Mongol empire declined in the west, it flourished even more in the east. For the Mongol (usually called Mogul) empire in India, see the article on *Moguls.* See also *Tatars.*

MONITOR AND MERRIMAC. Early in the Civil War the federal forces abandoned the navy yard at Gosport in the Elizabeth River in Virginia. At the time they sank a number of ships, including the *Merrimac.* In 1862 the Confederates raised this ship and made her into an ironclad. Though officially renamed the *Virginia,* the old designation still clung to the warship. After disabling two Northern ships, the *Merrimac* was attacked by the *Monitor,* which had been constructed under plans of Capt. John Ericsson. The *Monitor* consisted of a round, heavily iron-protected superstructure, resting on a flat and low-lying base; she was often called "a cheese box on a raft." After a duel lasting four hours, the *Merrimac* withdrew in a somewhat disabled condition. See article on *John Ericsson.*

MONMOUTH, BATTLE OF. When the British, commanded by General Sir Henry Clinton, were withdrawing from Philadelphia and attempting to reach Sandy Hook, New Jersey, Washington asked General Charles Lee to attack their rear at Monmouth Court House, now called Freehold. Washington promised to support him with the main army, should this be needed. Lee spent the time in elaborate preparations, and, when the British came up unexpectedly, Lee asked part of his men to withdraw, and the rest followed in what became a general retreat. Washington came up, rallied the colonial forces, and a battle ensued. Cornwallis withdrew the British forces during the night. Losses were, Americans 362; British, 416. Over 100 men died from exhaustion and the heat of the day, June 28, 1778.

MONROE DOCTRINE. See under administration of President Monroe.

MONS, BATTLE OF. At the town of Mons in Belgium, the British Expeditionary Forces in 1914 entered their first battle of the World War. The plan was for them to hold part of the line, with the French territorial troops on the left and the Fifth French Army on the right. They became separated, however, and some of the territorials failed to arrive. General French, having only 50,000 men, was forced to fall back when the French retreated on his right. Later the British troops stood firm in the defense of Paris in connection with the first battle of the Marne. On Nov. 11, 1918 Mons was the last town captured by the British in the war.

MONTCALM, LOUIS JOSEPH, MARQUIS DE (1712-1759). Eminent French general, who for years served in Italy and Germany, and then in 1756 took charge of the French army in Canada. Within two years he captured Fort Ontario where Oswego now stands, and Fort William Henry on Lake George. Then in 1758, with only 3600 Canadians, he defended Fort Ticonderoga against an attack of 15,000 British under General Abercromby. Lack of equipment forced the French to fall back to Quebec, where General Wolfe began a siege on July 31, 1759. After six weeks the British scaled the Heights of Abraham to get at the city, and then Montcalm risked a battle. Wolfe died in the moment of his great success in taking the city, and Montcalm, mortally wounded in trying to rally his scattered men, died the following day. Both commanders were greatly admired by their associates and their soldiers. See Francis Parkman's *Montcalm and Wolfe;* also *French and Indian War.*

MONTEZUMA. The name of two of the last Aztec emperors of Mexico. Montezuma I extended the territory and built notable public works. Montezuma II, who succeeded his uncle, Ahuitzoll, in 1502, was the last of the great Aztec rulers. He enlarged his domains by wars with Tlaxcala, Guatemala, and even Nicaragua. When Cortez appeared in 1519, Montezuma II sent out an embassy to welcome him and to promise friendship. The Spaniards held him virtually a prisoner at Mexico City. When the Aztecs at last revolted, Montezuma from the roof of his palace commanded them to cease their attacks on the invaders. His countrymen turned upon him, and he died from his wounds three days later. The Aztecs refused to honor him with the usual cere-

monials for their emperors. Montezuma had feared the ancient prophecy that the first king of their lynasty would return from the east when the line was to perish.

MONTFORT, SIMON DE (1200 ?-1265). Earl of Leicester, having come from France in 1229, settled on his English estates, and married the king's sister. At times he quarreled with Henry. Montfort went on a crusade in 1240, declined to act as regent of France in 1253, and tried to shield the king from the growing storm in England. When Henry revoked the reforms secured in the Provisions of Oxford, Montfort took the side of the barons. On being asked to arbitrate the disputes, Louis IX of France decided that Henry's promise was void. This precipitated a civil war. Montfort's party defeated the royal forces at Lewes in 1264, and took the king and other nobles prisoners. The subsequent policy of Montfort proved unpopular, and he was defeated at the battle of Evesham in 1265, at which time he was slain.

MONTGOMERY, RICHARD (1736-1775). An Irish-American soldier, who was born in County Dublin and educated at Trinity College. From 1756 to 1772 he served in the British army, attaining the rank of captain in 1761. He served in New York in 1772, and in 1775 became brigadier general in the colonial army. Montgomery succeeded General Schuyler in command of the forces in Canada, and made an assault on Quebec on the last day of 1775. At the first charge he was mortally wounded. The garrison of Quebec interred him with honors of war, Congress erected a monument in St. Paul's churchyard in New York City, and there he was reinterred in 1818.

MONTREAL. Principal city of Canada. Jacques Cartier (1535) ascended the St. Lawrence and found the Indian village, Hochelaga, at the foot of a mountain, which he named Mount Royal. When Champlain visited the spot (1603), the village had been destroyed. He established eight trading posts there (1611). The permanent settlement was founded (1642) through the missionary zeal of Jerome le Royer de la Dauversiere, a French nobleman, and Jean Jacques Olier, a French priest, by whom the island of Montreal was purchased when it was named Ville-Marie de Montreal. They founded religious communities (1) to teach nuns, (2) convert the Indians, and (3) train hospital nuns. De Maisonneuve was appointed governor. For many years the city was engaged in wars with the Iroquois. Aid from France broke the power of the red men (1665). It became the center of fur trade, receiving the name "Mother of Cities" (1672). The English from New York unsuccessfully attacked it (1690), but (1760) captured it as well as the whole of Canada. The Americans led by Montgomery took possession of it (1775), but in 1776 were forced to abandon the city and leave Canada. In the War of 1812, Montreal was threatened, but her forces checked all advances.

From 1844 to 1847, Montreal was the capital of Canada. After a mob burned the parliament buildings, the government moved to Quebec, and later to Ottowa. Notable buildings in Montreal are the seminary of St. Sulpice, dating from French times, the great church of Notre Dame, the nunnery of the Grey Friars (founded by a Canadian lady), St. Mary's College, and McGill University.

MONTROSE, JAMES GRAHAM (1612-1650). Scotch noble and soldier, born at Old Montrose, a graduate of St. Andrews University, and a traveler in Europe. Several times he took the side of the National Covenant, but at last joined the forces of King Charles I, who appointed him royal general in Scotland in 1644 and created him Marquis of Montrose. Though he won six battles for the king, he was unable to gain support of the Lowlands. After a defeat at Philiphaugh on Sept. 13, 1745, his army faded away. Montrose escaped, got aid abroad, and in 1649 again entered Scotland, but was defeated and executed the next year.

MOORE, SIR JOHN (1761-1809). Frequently called the greatest trainer that the British army has ever known. He was gifted with insight as to character, and much of the success of Wellington is due to the men that Moore trained in his various campaigns. He was born in Scotland, entered the army at an early age, served in America, and was in Parliament from 1783 to 1787, when he entered the army again as a major. After service in the Mediterranean, he was sent to the West Indies, was in Ireland during the rebellion of 1798, then in Holland. On Oct. 2, 1799 in Holland he was wounded for the fourth time, and from then to his death was with the 52d. British regiment. He served and was wounded in Egypt, assisted Gustavus IV of Sweden against Russia, France, and Denmark, and then went to Portugal, after the Swedish king had made unreasonable demands upon him. As an ally of Spain against Napoleon, in the Peninsular War, Moore conducted the masterly retreat to Corunna, which ended with his great success in the battle of Jan. 16, 1809. He was fatally wounded, lived to recommend his friends, and to ask that he be interred in the ramparts of Corunna.

MOORS. Term for tribes in northern Africa, who at first allied with the Vandals from central Europe, and then were conquered by the Arabs in the 8th century. The Moors appeared in Spain after 1000, and built a kingdom on the ruins of the old caliphate of Cordova. The Almohades sect flourished in Africa and in some districts of Spain until 1212. Later they joined in founding the kingdom of Granada, which rose to heights of power and grandeur. In 1492 they yielded to Ferdinand and Isabella; some became Christians, and some pirates on the Mediterranean. The remnant left in Spain came to be called Moriscos. Philip II gave them few privileges, though they had been peaceful and industrious for many years, and in 1568 the Moriscos revolted. They were repressed with great cruelty, and driven into Africa in 1609. See *Caliphate, Cordova,* and *Spain.*

MORAVIA. Early tribes of Moravia were the Boii (Celtic peoples), the Quadi, and the Avars, who came about 567. Next the Slavonian settlers took the name Moraviana from the river Morava, and after 800 they were incorporated in the greater German confederation. Christianity was introduced from the East about 860, and within ten years the Roman influence predominated. Moravia was devastated in 908 after an unsuccessful rebellion, and finally in 1029 became part of Bohemia, and along with other districts fell under Habsburg domination in 1526. In 1849 it was separated from Bohemia to form a crown land in itself. After the World War Moravia became an important province of Czechoslovakia, in 1927, with more or less autonomous rule.

MORGAN, JOHN HUNT (1825-1864). Confederate soldier, who had fought in the Mexican War, and now known for his raids into northern territory. Gen. Braxton Bragg, his commanding officer, authorized him to raid in Kentucky, but Morgan crossed the Ohio, July 1863, with about 2500 men. After a skirmish with Federals, in which he lost 600 men, he was at last captured at New Lisbon. He had killed 38 civilians and destroyed $50,000 worth of property. Morgan was confined in the penitentiary at Columbus, from which he escaped on Nov. 27, returned to service in the South, and was shot at Greeneville, Tenn., Sept. 4, 1864.

MORMONS. Religious sect founded by Joseph Smith and a few followers after he claimed to have found some golden plates in 1827, on which was inscribed the Book of Mormon. He published a translation from the plates, as he said, in 1830, and started the sect at Fayette, New York, later perfected in Ohio, where the membership rose to about 3000. A year later they moved to Missouri, then in 1838 founded Nauvoo, Ill., on the Mississippi River. Smith became mayor of the town, which he tried to close to outsiders. He was arrested, lodged in the jail at Carthage, Ill., and was taken out by a mob. In the confusion Smith and others were shot. The main opposition was caused by his doctrine of plural marriages, first announced in 1852. His son, also named Joseph Smith, refused to sanction polygmy, reorganized the church, and remained its head from 1860 to 1914. This is called the Reorganized Church of Jesus Christ of Latter-Day Saints, with headquarters at Independence, Mo. After the death of the elder Smith, Young gathered about 200 Mormons together, took them to Iowa, and at last to Utah, where 148 settled on government lands, developed a strong business and church organization which became politically powerful. The Mormons in Utah and adjacent states are ruled by twelve elders, who hold office indefinitely. Plural marriages continued until both the church and nation forbad them in 1890. The Mormons of the west in 1930 were said to number about 660,000; the Reorganized branch, about 105,000.

MOROCCO. Little is known of this region before the fifth century, when the Vandals came, followed in turn by the Arabs about 650, the Moorish empire about 800, and then five centuries of progress until in 1300 the Moors claimed dominion to Egypt on the east and into Spain on the north. Modern Morocco is inhabited by four distinct peoples: an early tribe, the Berbers, now mainly in the mountains; the Arabs, on the lower lands; the Moors, a mixture of Berbers and Arabs; the black slaves of former times and now their descendants. After a succession of dynasties, Filali and his successors ruled from 1546 to present days. Much uncertainty has made Morocco an international problem. By 1904 Great Britain had recognized the interests of France there, but Germany continued to press her claims until after the World War. The Algeciras Conference in 1906 tried to reconcile the conflicting interests of Spain, Italy, France, and Germany. Then followed years of conflict between the French and the tribesmen, and between the Spanish and the Riffian mountaineers. Meanwhile native rulers continued, but under supervision of France and Spain. Mulai Hafid deposed his brother, Abd-el-aziz in 1908, and in turn gave way to another brother, Mular Tusef, in 1912. Between 1902 and 1925 France maintained order largely because of the skill of the resident general, Lyautey, who saved Morocco for France twice, conciliated some of the tribes, withstood German and native propaganda, and assisted Spain (which had been badly beaten in 1923) to put down a rebellion of Abd-el-Krim in 1925-26. Mulai Mohammed succeeded his father in 1927. Tangier is an international zone across from Gibraltar.

MOSCOW. Mentioned before 1156 as a village, the home of a prince, whose successors gradually extended their sway, until Ivan III claimed to be ruler of all Russia. The Tatars burned Moscow in 1237 and 1293, a fire destroyed much of the city in 1547, and again the Tatars wrought havoc in 1571 and 1591. Other fires destroyed great portions of the city in 1739, 1748, 1753, and in 1812 when Napoleon occupied Moscow. The French remained there from Sept. 13 to Oct. 19, and then followed the tragic retreat of 80,000 French, more than 30,000 of whom perished of cold and hunger along the march. Moscow was a magnificent city until the capital was removed, 1703, to St. Petersburg, when a gradual decline began. On an eminence in the city, a great fortress called the Kremlin contained the royal palaces, cathedral of the Annunciation, the Archangel cathedral, with tombs of the tsars, several other great churches, government buildings, and homes for the nobles. When the government was established there again in 1918, the Soviets turned most of these to public uses, and just outside, in the Red Square, erected the magnificent tomb of Nicolai Lenin. Other churches became museums, while still other buildings were turned into exhibition galleries for all the industrial history of recent years. From 1917 to 1920 privations in Moscow reduced the population from about 2,000,000 to 800,000, but it is now back to the former figure. Some skyscrapers have been erected, sanitation much improved, transportation improved by means of a subway, and industry greatly quickened.

MOSUL. Formerly a Turkish vilayet, now part of the kingdom of Iraq, and corresponding in part to the ancient Assyrian territory. During the World War, Great Britain and Russia sought to control the countries between the Black Sea and the Persian Gulf. Mosul was the objective of the British under General Maude, coming up the Tigris from Bagdad in 1916, and of the Russians coming from Persia and the west. After the withdrawal of the Russians and the death of General Maude, the British continued with the difficult task of freeing parts of Asia from the Turkish rule. Just before the Armistice in 1918, the British under General Marshall reached a point near Mosul, and later the troops went much beyond. By the final settlement the rich oil fields in Mosul went to the new Iraq, but the Turks were to share in the royalties for 25 years, and receive compensation for certain public works of the Turkish government.

MOUND BUILDERS. Early inhabitants of North America, chiefly in the Ohio and Mississippi valleys. These persons were once thought to be a prehistoric race, whom the Indians exterminated. Now they are said to have been early aboriginal tribes, probably ancestors of the many tribes of this region when the white man came to America. They made many artistic objects of stone, bone, and beaten metal, but did not know the art of refining or smelting iron. Hence they are said to belong to the Stone Age. Some of their mounds are round, some square, and some the shape of numerous animals. In Ohio, where the mounds are very numerous and varied, altar mounds are observed, showing the effects of fires, around which numerous articles are found. In Adams County, Ohio, the most extensive mound is in form of a serpent, with jaws 75 feet wide, body 30 feet across, and length over 1300 feet. The tail is coiled three times. In Wisconsin gigantic birds, reptiles, and mammals are carved in the landscape, many of them most distinctly outlined. Some of the forms are cut or sunk in the earth. Nearby are found thousands of burial mounds and some objects. In Tennessee burial places made of slabs of stone erected on edge are rather numerous. In an upper layer burials were made in a reclining posture; in the lower layer, bones are piled together, after having been scraped. That these were different types of people and grades of civilization appears from the remains themselves.

MOUNT VERNON. Ancestral estate of the Washington family in Virginia, 15 miles south of Washington, D. C., along the Potomac. It was the home of John Washington, original of the family in America, and passed, in succession, to George Washington in 1761, from the widow of his half-brother Lawrence. Part of the present manor-house was built in 1743, but this was enlarged in 1784-85, when Washington had two wings built, together with servants' quarters and other outbuildings. He also laid out the grounds and arranged for a tomb, where he and Mrs. Washington, and some 30 of their relatives are now resting. From the Washingtons the estate went to his nephew, Bushrod, and then to a nephew of the latter, who provided in his will that a son might sell it to the government. It was accordingly offered for $100,000, but Congress refused the purchase. Edward Everett succeeded in raising much of the final price agreed upon, double the offer to the government, and the Mount Vernon Ladies Association assumed control, promising to keep it as a national shrine forever. Much of the original furniture of the Washingtons is still at Mount Vernon.

MUGWUMPS. The name comes from the Algonkian Indian dialect and means "big chiefs." In his version of the Bible for Indian tribes of New England, Rev. John Eliot wrote it *Mugguomp*, and translated the word "leader" or "duke." In the political campaign of 1884, certain Republicans, interested in governmental reforms, notably in the civil service, turned from the nominee of their party (James G. Blaine) and supported Grover Cleveland, the nominee of the Democrats. In derision they were called mugwumps, meaning persons who assume leadership or set themselves up as superior to party affiliations.

MUNICH. On the site said to have been used by monks (*München*, hence the name of the city), Munich was founded about 962. The city was captured by Gustavus Adolphus of Sweden, 1632; by the Austrians, 1704, 1741, and 1743; and by the French, 1800. For a long time Munich has been noted for its various practical arts and for the brewing of excellent beer. Some of the notable structures are the Bavarian National Museum and St. Peter's Church, founded in 1294; the university, moved here in 1826 from Lundshut, but founded in Ingolstadt in 1472; and the German Museum of Natural and Technical Sciences, largest in the world, founded in 1925; and an art gallery devoted to modern masterpieces.

MURAT, JOACHIM (1771-1815). This son of an innkeeper, intended for the priesthood, chose the army instead. Napoleon made him a division general in 1799, set him up as king of the Two Sicilies in 1808, but Murat was able to hold only Naples. He led an expedition against Russia, crushed the Austrians at Dresden in 1813, but with some of the other generals was badly beaten at Leipzig. When Napoleon returned from his first exile, Murat once more made war on Austria, but reverses overtook him in 1815. Then he tried to reclaim his old kingdom of Naples, but was arrested, tried by courtmartial, and executed.

MUSCLE SHOALS. Name for a dip in the Tennessee River where it enters and leaves Alabama, with a descent of 132 feet in 37 miles, capable of producing much water-power. Schemes to utilize

this date back to the time of President Monroe. A canal was built there in 1836, but proved unproductive, as did also a new project in 1875. During the World War, the need for more nitrates led the administration to start building of a colossal dam and accessories suitable for making this, and also for generating power from the water thus impounded. One plant was completed in 1919. Until Pres. Hoover appointed a commission of three to continue the construction of the project, little real accomplishment was made after the World War period. Hoover designed to take the project out of politics, where it had always been. In 1933 a new dam was started, and also on the Clinch river near Nashville a third project known as Norris dam. The object of the last is mainly to store water; of the original Wilson, and the second (named Wheeler) Dam to make nitrates and electric power. The capacity, as now planned, will be about 360,000 horse power for the Muscle Shoals developments. The Supreme Court, 1936, confirmed the right to utilize the power of falling water for generating power. Meanwhile, the Alabama Power Company has completed a steam-plant 80 miles below Muscle Shoals, and this is capable of generating, it is claimed, 320,000 horse power.

MYCENAE. Ancient city of Argolis in Greece, where Heinrich Schliemann in 1876 began extensive researches. He unearthed treasures of rare beauty by digging down in the acropolis of the ancient city. Nothing like these evidences of the story of men have been found elsewhere in Europe. Beginning above ground with the Lion Gate of Mycenae, Schliemann found three levels of civilization. The lowest contains evidences of the Bronze Age of mankind. The second, just above this, contains the royal tombs, columned entrance to the royal palace, and many smaller structures, some of which as yet are not fully explored. The uppermost level at Mycenae contains evidences of a civilization that ran parallel to the 18th dynasty in Egypt. The last race restored the earlier palace, erected some structures for the use of the court, and built the beehive burial mounds for which Mycenae is noted, together with a magnificent structure called the Treasury of Atreus, the Tomb of the Genii, and others carved out of solid rock. Rodenwald between 1912 and 1914 studied some of the elaborate frescoes of the palace, and Wace later explored many of the tombs. In extent and beauty, these discoveries rival those found in the tomb of King Tutankemen in Egypt. See article on *Crete*.

NANA SAHIB (c. 1820-1860). An adopted son of Biji Rao, who surrendered to Great Britain certain rights in India on condition that he should receive a pension of 80,000 pounds yearly. When the British declined to continue this to Nana Sahib, after the death of his foster father, Nana became an implacable enemy. Yet he professed friendship, but was responsible for the massacre of women and children at Cawnpore in 1857. He escaped into Natal two years later, and is supposed to have died there.

NANTES, EDICT OF. The Protestants of France, in April 1598, were granted religious liberties by Henry IV. They were also to share in civil benefits, and a council was set up to adjust any differences between the state church and Protestants. Paris reluctantly approved this act in 1599, and other districts followed suit, Rouen being the last in 1609. When the power of the Protestant lords promised to become a menace to the ruling class, Cardinal Richelieu curbed them in 1628. Louis XIV revoked the Edict of Nantes in 1685, after which time the Protestants lost much of their liberty.

NAPIER, SIR CHARLES JAMES (1782-1853). English general who served in the rebellion in Ireland in 1798; commanded the 50th infantry in the campaign at Corunna, Spain, where he was taken prisoner by the French; and then went to the United States with an expedition in 1813. He took command of British forces in India in 1841, went to Sind in 1842 and remained there for five years. With only 2800 men, Napier attacked the Baluchi at Hyderabad, and won an amazing victory against 30,000 of these wild tribesmen. This feat was duplicated at Miani. After a visit to England, he returned to India to find the Sikh War ended. He was appointed governor of conquered territory, but disagreed with others and with the East India Company. As a result he resigned and retired. He is given credit of forseeing the later outbreak of 1857, known as the Sepoy Rebellion of India.

NAVARINO, BATTLE OF. When Greece was fighting for her independence from Turkey in 1827, the allied countries of Great Britain, Russia, and France asked for an armistice. Greece accepted the terms in August, but Turkey refused these the next month. Ibrahim Pasha came from Egypt with a fleet and army to assist the Turks, but he informed the allies that he was withdrawing because of their protest. Instead, the commander of the allied fleet found the Turkish and Egyptian warships assembled in a semi-circle formation in the Bay of Navarino off Greece. When the Egyptians fired on a patrol boat, the engagement became general. The allied heavy firing sank many enemy craft, and some were set on fire by their crews, so that three-fourths were lost. The allied casualties were 177 killed, 519 disabled; the loss of the Turks and Egyptians was never reported.

NEAR EASTERN QUESTION. All the countries in the southeast of Europe have been in ferment for over a hundred years. Various political alignments have failed to satisfy racial and national aspirations. The Slavs outside of Russia have often been the pawns of ambitious politicians. Russia, Turkey, and Austria have contended for mastery over small and discordant groups speaking different languages. The Czechs, Hungarians, Croats, Slovenians, and Ruthenians, in the old Austro-Hungarian dual empire were often at odds on racial and national questions. Likewise, the Bohemians, Poles, and others could not well get along with the German elements in Austria. To the east the Bulgars, Greeks, Rumanians, Macedonians, Turks, and Russians jostled each other in the same territory. Men of the same race and speech have claimed that they should have separate national boundaries, but much overlapping gave rise to numerous feuds, intrigues, and wars. Some of the specific questions may be mentioned. Crete struggled for independence from Turkey or annexation to Greece, achieved in 1913. The desire of Greece to found a modern empire around the eastern Mediterranean was checked once more after the World War. Whether the Black Sea should be open or closed to nations not bordering on it, and whether the Dardanelles should be fortified by Turkey; the attempts of both Germany and Austria to keep Russia from expanding to the westward; and of various powers to confine Russia to her borders as recognized in 1778 were additional worries for Near East nations. The removal of the Turkish government from Constantinople to Asia Minor; the establishment of something like order in Armenia, Georgia, and the Ukraine; founding of a Jewish state in Palestine; the exchange of 600,000 Greek nationals for a similar number of Turks; and modern democratic movements in all the Near East have caused at least temporary stability.

NELSON, HORATIO (1758-1805). The most famous of British admirals, who joined the navy in 1770, and served in 1793 in the Mediterranean, where he lost an eye in the siege of Corsica. In 1797 he helped defeat the Spaniards off Cape St. Vincent, was that same year made a knight and rear admiral. For his success in defeating the French fleet at the Battle of the Nile in Aboukir Bay, he was created Baron Nelson in 1798. On April 2 off Copenhagen he defeated the Danish navy, and was then made a viscount. After the short Peace of Amiens, in May 1803 he took command in the Mediterranean. Napoleon planned to invade England while the French fleets protected his crossing the Channel. Nelson chased the main fleet to the West Indies and back again, and so prevented the plan from being carried out. Fearing dismissal if he did not stand for action, the French admiral, Villeneuve, came out of his refuge in Cadiz harbor, and the battle of Trafalgar occurred on Oct. 21, 1805. Little was left of French prestige on the sea after this battle, but Nelson was mortally wounded. His last words were, "Thank God, I have done my duty." Nelson was buried in St. Paul's Cathedral in London. A magnificent monument was erected in 1849 in Trafalgar Square to commemorate his victory.

NETHERLANDS. Once this name was applied to all the territory now known as Holland, Belgium, and the northeast districts of France. Julius Caesar found the Belgian tribes hard to conquer; so did all the petty kings down to Charlemagne. In 843 the district east of the Scheldt went to Lothaire.

In the 9th century the Northmen gained a foothold for a brief time only. The feudal lords, Burgundian kings, and the Habsburgs (the last after 1477) continued to rule all or part of the Netherlands. Charles V of Spain joined the Netherlands to the conquests of that kingdom, but the inhabitants revolted and were put down with uncommon brutality by the Duke of Alva from 1568 to 1573. (See article on *William the Silent.*) In 1579 the union of Utrecht was formed. In 1881 the Netherlands claimed their independence, which Spain, after various attempts to hold these districts, finally acknowledged in 1648.

Meanwhile, the Dutch had become masters of the sea, which the British contested in two wars between 1652 and 1667, followed by a war on land in which both France and Great Britain joined against the Netherlands. When King William, who had married Mary of York, came to the British throne in 1688, the English and Dutch began to be firm allies, and, after the peace of Utrecht in 1713, the Netherlands entered upon her greatest commercial period. In 1806 Napoleon placed Louis Bonaparte on the throne of Holland, but the house of Orange was restored in 1810 when the two parts,—north and south provinces,—became the kingdom of the Netherlands. In 1830, however, the southern portion was set off as Belgium, the neutrality being guaranteed by the powers and respected until Germany invaded the land in 1914. In 1848 a new constitution was granted; in 1868 Luxembourg was set off as a duchy; in 1872 Britain and Holland came to an understanding as to their conflict of interests in the East Indies; in 1887 the franchise was further extended to the people of Holland, and three years later the long reign of Queen Wilhelmina began. The Netherlands protected the borders during the World War by maintaining a standing army of 300,000 along the boundary lines.

NEUTRALITY IN WAR. Until after the Middle Ages, the idea of abstention from conflicts of neighbors was a vague conception. Usually the strong nations or the church authorities saw to it that princes and states not concerned in quarrels should stay out. In the 16th century one prince was sometimes asked to act as *neutre* or guardian of property during conflicts. Neutrality with reference to commerce on the high seas has now become a fixed concept. Washington, in 1793, declared that it is the duty of a neutral state to prevent acts that would injure one of the parties to a war. In 1770 and 1780 Russia and neighboring nations had advocated armed neutrality,—the use of an army or ships to enforce embargoes or other restraints. During the World War, Holland and other nations stationed armies along neutral borders to keep belligerents away. Soldiers who crossed neutral borders were interned for the rest of the war.

Jefferson said that England might starve France, but had no right to expect the United States to help accomplish this. The Declaration of Paris, 1856, defined the rights of neutral nations, and outlawed privateering. The Hague Conference, 1899 and 1907, considered the subject at length and established some elaborate rulings. All these were violated during the World War. The Declaration of Paris ruled that a neutral, in seeking to run a blockade, could lose ship and cargo if caught. In 1917 the British Orders in Council decreed that a ship, bound for a port of enemies of the allies, must stop first at an English port or else be liable to seizure. By earlier decisions, as early as 1799, a ship must not put off cargo at a neutral port, this cargo then to be sent to an enemy port either by sea or by land. The World War raised the question as to whether strict neutrality is practical or even to be attempted.

NEW BRUNSWICK. One of the original three provinces forming the Dominion of Canada in 1867, the others being Ontario and Quebec. The French first settled on the Bay of Chaleurs in 1639, but this district, with Nova Scotia, became English in 1654, then French again in 1667, and at last was ceded to Great Britain in 1713 by the Treaty of Utrecht. Scotch agriculturists settled there in 1764, and in 1783 about 5000 loyalists came up from the United States, following the granting of independence to the American colonies. Nova Scotia and New Brunswick were separated in 1784, the government being by an assembly and a council, the latter not responsible to the people. In 1847-48 responsible government was established after considerable agitation. The capital of New Brunswick is Fredericton, called St. Anne from 1740 to 1786.

NEWFOUNDLAND. Though claimed for England by Sir Humphrey Gilbert in 1583, this island, now a separate colonial dominion of the British Empire, was settled rather tardily. In 1650 but 350 families were permanently resident there, but the waters swarmed with whaling and fishing craft. The Treaty of Utrecht gave France the right to dry and cure fish on the north and west coasts. Newfoundland had about 80,000 people in 1814. Representative government began in 1832, and the administration was fully organized in 1858. Canada, France, Britain, and the United States began early to compete for fishing privileges in the waters of the north Atlantic. Fishermen from Denmark, Norway, Sweden, and Iceland also frequented these waters. In 1783, 1818, 1854, 1885, 1910, and 1927 fishing rights were considered by international groups. The Hague Tribunal in 1910 limited United States rights to the district outside of a three-mile limit from Newfoundland shores. In 1927 the long dispute between the Dominions of Canada and Newfoundland was settled when the latter was given a definite boundary and also control of the vast district known as Labrador on the mainland to the northwest. By this decision the territory of greater Newfoundland was increased three fold. Newfoundland proper is about five-sixths as large as England. Owing to financial difficulties, Newfoundland, with consent of the dominion parliament, in 1933 reverted temporarily to the status of a crown colony of Great Britain, to be ruled by a commission of six, three from the mother country and three local representatives.

NEW ORLEANS. La Nouvelle Orleans was founded about 1718 by the French governor of Louisiana, Jean Baptiste Le Moyne, Sieur de Bienville. In 1722 it became the seat of the colony. Before 1740 the Capuchin monks, Ursuline nuns, and French Jesuits were well established. After the French and Indian War, all territory east of the Mississippi went to England, and Louisiana to Spain, but in 1765 the Spanish governor was driven out, when he attempted to claim the city. In 1769 the Spanish took full possession, relinquished again to France in 1802. Meanwhile, the Cabildo or town hall had been built and given to the city by Governor Rojas in 1795; a cathedral had been erected; and the Ursuline nunnery repaired. Between 1803 and 1810 the population almost doubled. In 1836 the area was divided into three parts, but these were united again in 1852. Much trouble resulted between the old creole population and the Americans who came after 1802. New Orleans became the center of southern trade with the West Indies, as well as the port of commerce of the lower Mississippi. It suffered much during the War of 1812 and the Civil War, from fires and hurricanes before 1800, and from yellow fever in 1853-55. The old French quarter is of great interest to visitors, with the many interesting old halls, balconies, the apartments erected by Baroness Pontalba in 1857, the home prepared for Napoleon, but never occupied by him, and the various civic structures already mentioned. Until 1880 New Orleans was the capital of Louisiana.

NEW ORLEANS, BATTLE OF. Along the Mississippi, south of New Orleans, Gen. Andrew Jackson fought two battles with the British in Dec. 1814 and Jan. 1815. The first proved indecisive. Two weeks later Gen. Pakenham took half his British force up the river toward New Orleans. Here the Americans poured into their ranks a deadly cross fire, killing or wounding 2600, including Gen. Pakenham himself, who was fatally shot. The American loss was eight killed and 13 wounded. Peace had been signed, however, at Ghent in Belgium fifteen days before the battle. News of the peace and of the defeat of the British by Jackson reached Washington about the same time.

NEW ZEALAND. This British dominion in the south seas is made up of three large islands and some smaller ones that were settled before 1500 by natives of Polynesia. Abel Jensen Tasman sighted the islands in 1644, but Capt. James Cook was the first European to land on the shores in 1769. He claimed them for Britain, and the English declined his "annexation," but the Union Jack was raised there in 1840. Missionaries, who first landed in New Zealand in 1814, by 1835 had made some headway. The aboriginal Maoris until 1870 caused much disturbance. The discovery of gold in 1853, growth of wool production, expansion of credit and banking facilities caused periods of great prosperity. Panics

in 1879 and 1921, however, caused considerable distress. Political conditions have been rather stable, and the government has enacted many progressive measures. The conservatives ruled for 12 years, then the liberals for 20, and the former again from 1912 to 1930, when a coalition government came into office.

NEY, MICHEL (1769-1815). Faithful general of Napoleon, who rose from a subordinate position, between 1788 to 1799, to be general of a brigade. He fought in the Swiss campaign, at Hohenlinden, and at Elchingen, where his signal victory gained the title of duke of Elchingen. His next great successes were at Ulm and at Friedland, after which Napoleon pronounced him "the bravest of the brave." He was created prince of Moskowa after the battle of Borodino in Russia. During the retreat from Moscow, in the dead of winter, Ney marched with his men and was the last to cross the border. Napoleon called him rather tardily to command a division in the final battle of Waterloo. Ney then wavered in his devotion to the Bourbon cause. He went out to welcome Napoleon on his escape from the first exile, when he was supposed to command a force against the fallen hero. For this Ney was arrested, tried, and shot on the morning of Dec. 7, 1815.

NICARAGUA. Before 1821 this country of Central America was part of the Spanish possessions, being a part of Guatemala. From 1821 to 1913 many periods of disorder, dictatorships, and political uncertainty followed until a constitution finally set up a republic. In the early days of independence, León and Granada, the two chief cities, often were in conflict, and sometimes actually at war. In 1858 William Walker, an American, landed with a force of 66 men and joined the army of León. Four years later he was executed. Germany blockaded some of the ports in 1875, and England one of them in 1895. From 1893 to 1909, Zelaya, of the liberal party, ruled as a dictator. From 1912 to 1925 American marines guarded the United States legation. Chamorro, who failed to gain the presidency in 1924, revolted, and in 1926 troops from the United States were again landed. They supervised the elections in 1928, when Gen. Jose M. Moncada was chosen president, and again in 1932 when Gen. Juan B. Sacasa won the election. From 1929 to Feb. 1933, Gen. Sandino, a bandit leader, caused much trouble and anxiety, until he made his peace with the new government under Sacasa. One year later he was killed in a skirmish with the national guard. Managua, capital of Nicaragua, was nearly destroyed by an earthquake and fire in 1931.

NICEA, COUNCILS OF. Nicea in Asia Minor was the seat of two councils of great importance in the history of the Christian church. One of these in 323 considered the Arian controversy. The Arians, led by Arius of Alexandria asserted that, if Christ were the son of God, then he could not have existed at a previous time. Constantine raised the question at the Council of Nicea, the doctrine was declared heretical, and Arius was banished to Illyria. Then the Council proceeded to formulate all the beliefs of the ancient church, taking them from various creeds like that of Constantinople and Jerusalem. In 787 the Empress Irene called a second council at Nicea, this time to decide on the orthodox opinion as to images. The second council was attended by 375 bishops; the first by 318.

NILE, BATTLE OF THE. Here in Abukir Bay, at the mouth of the Nile, a naval battle was fought on Aug. 1, 1798. After Austria ceased to support England against Napoleon, the French went to Egypt to annoy Great Britain in any manner possible. Jarvis and Nelson, the English admirals, sought the French fleet for some time. Shortly after Nelson had visited Alexandria, the French arrived; and Nelson returned after he had taken on provisions at Syracuse with the aid of the Neapolitans. He divided his ships into two lines,—one for the landward side of the enemy, the other for the seaward. The battle began about dusk, and by ten the French flagship was blown up. Other ships in turn were cornered, save for two battleships and two frigates, which the British later destroyed. DeBrueys, the French admiral, was killed in the battle of the Nile. By his great victory Nelson gained control of the Mediterranean for England, and the cabinet was able to form other alliances, which eventually defeated Napoleon on land and sea.

NINEVAH. Once a magnificent capital of the Assyrian empire, on the Tigris River, opposite the modern Mosul, and under the present town of Kouyunjik. The ancient city, three miles long and wedge shaped, had fifteen gates. Excavations have uncovered the great palace of Ashur-banipal, on the n rth; south of this the temple of Nabu; then a great rectangle, part of a temple possibly; and farther south and east the palace of Sennacherib. The palace contained many exquisite works of art, mainly the bas-reliefs. Hammurabi restored the ancient temple of Istar, and Shalmaneser I, also about 1300 B. C., a thousand years later. In 612 B. C. the Medes stormed Ninevah and destroyed the glory of the ancient city.

NIPPUR. This ancient sacred town of Mesopotamia, of Sumerian origin, has left us a complete record in clay tablets. One of these shows the dimensions of the city, and also of the enclosure within the walls, like the imperial city within Peking in modern ages. The temple was the center of veneration, being restored several times, mainly by Ashurbanipal in the 7th century. South of Nippur about six miles, extensive archives have been found in the form of clay tablets. One very large mound, 200 feet wide and 300 from north to south, and 40 feet high, remains to be excavated, and here important further discoveries are expected.

NOMADS. Pastoral tribes who have no settled habitations, but roam about in search of food, or of pastures for their animals. Nomads are of two kinds, —those like some Arab tribes who remain within one political area or district, and those who, like the gypsies, go into the lands of other peoples. Of the first class, the Bedouins have long been well known. Some Arabian nomadic tribes have settled down in permanent towns, but they are exceptions. The Mongols of Asia were nomads of high culture in early centuries; so were the Basques of Spain and France, a mysterious people, thought by some to be descendants of inhabitants of some lost Atlantic island. The bushmen of Africa and Australia and black tribes like the Hottentots are examples of present primitive nomadic tribes. Tradition mentions the ten lost tribes of Israel as nomadic, but merged with other peoples, so that their identity became lost.

NORMANDY. An ancient district in northern France, conquered by Clovis in 506, and afterward allied with Neustria under the Merovingian kings. In 911 Charles the Simple allowed wanderers from the north to settle in his domains, and the district came to be known as Normandy, or land of the Northmen or Normans. Previous invaders of the same tribes had been beaten off after they had ascended the rivers to where Paris now is. Richard I, grandson of the leader Hrolf (or Rollo) who came in 911, gradually gained a foothold against the overlords of the district. One of his successors was the well-known William I who conquered England in 1066. William's son, Robert, in 1077 took Normandy from his father; but a successor, Henry I of England, in 1106 gained it back. With Henry I the male line expired; but Henry II, son of his daughter, Matilda, ruled both England and Normandy. From 1204 to 1415, however, Normandy was again independent, save for a brief time under Edward III of England. The British again ruled Normandy from 1415 to 1449. See article on *Northmen* just below.

NORTHMEN. Also called Norsemen or Vikings. These terms are general for the seafarers of Norway, Sweden, and Denmark between 800 and 1200. While they were pushing into the corners of the known world, some of their race at home were subduing the petty chiefs and founding modern nations. We hear first of Norsemen in Briton in 787; in Normandy (see article just above) in 837; in Ireland in 795; and as established residents in England after 866. Though Alfred the Great kept them in check, Ethelred II found the Norsemen hard to handle. So a general massacre in Britain was arranged. After this the Danes sent four harrying expeditions, and in 1013 Sweyn, king of Denmark, conquered England shortly before his death. In 1042 they gave way to the Saxons, who in turn welcomed William the Norman in 1066. Louis III of the West Franks held the Norsemen in abeyance, and so did some of the petty Germanic princes, but by 900 they had penetrated as far inland as Switzerland. Even before this they had gone to Spain, Italy, Portugal, and northern Africa, plundering and ruling for a brief time. Before 1000 they had settled in the isles north and

west of Scotland, in Ireland, Iceland, and perhaps had touched on the shores of the western hemisphere. Unlike the Romans, however, they failed in civil government.

NORWAY. Before the dawn of history, the Finns and the Teutons occupied Norway. Harold of the Fairhair (Harald Haarfagr) gathered the petty kingdoms into a union before his death about 930. By 1050 Christianity had gained a foothold. In 1028 Canute of Denmark drove out the Norwegian Olaf, and slew him in a later revolt about 1030, but five years later Olaf's son overthrew the foreign invaders, and native kings ruled until 1319. Meanwhile, Norse sailors had established themselves in Iceland, Greenland, the north of Scotland, and elsewhere. In 1397 Denmark, Sweden, and Norway united under the influence of Margaret, Queen of Norway. For 400 years this union continued until the Napoleonic wars disrupted Europe. In 1814 Denmark ceded Norway to Sweden, but the Norwegians set up an independent government, with a Danish prince as king. The governments refused to recognize this readjustment. Then Charles XIII of Sweden was elected king also of Norway. So the dual monarchy continued till, in 1905, the union was dissolved by mutual consent, at which time Prince Charles of Denmark became king of Norway as Haakon VII. The chief nations of Europe guaranteed the independence of Norway. During the World War, Norway suffered much from destruction of her shipping, but the country remained neutral. From 1261 Norway claimed the right to Svalbard (Spitzbergen), but this was not admitted by other nations of Europe, United States, and Japan until 1921, and by Russia finally in 1924. The Norwegian flag was raised there on Aug. 14, 1925.

OATES, TITUS (1649-1705). He was an English investigator, who professed to have unearthed a plot against the life of King Charles II in 1678. Charles never credited Oates, but the latter kept bringing forth evidence, and at last accused Coleman, secretary of the Duchess of York. The privy council soon exposed Oates, but he shortly afterward charged the queen with treason and her physician with wishing to poison the king. In the period many Jesuits and Roman Catholics suffered from the ensuing persecutions. Oates was sued for a considerable sum by Prince Charles, was imprisoned in default of payment of damages, and later convicted of perjury in the reign of James II. He was severely flogged, and served three and a half years in prison. After the Revolution of 1688, he was pardoned, given a small pension, and spent his remaining years in other schemes. He became a Baptist in 1698, but in 1701 was expelled for monetary irregularity.

O'CONNELL, DANIEL (1775-1847). Irish patriot, known in his time as "The Liberator," who came of a race of hardy Irishmen opposed to the disabilities placed on Catholics. In 1798 he was called to the bar, and no man of his day excelled him when examining witnesses. Gradually he felt obliged to engage in politics, and in 1828 was elected member for Clare, but he knew in advance his inability to serve because he could not take the proper oaths. This disability was removed in 1829, and he was elected in 1830. From this time to 1845 he labored for Catholic emancipation, secured a tremendous following, until the government of Peel (Oct. 1843) had O'Connell and others placed in jail. He was sentenced and fined, but the House of Lords refused to agree, and so he was released. His health was broken during his imprisonment awaiting trial, and his following dwindled away. On May 15, 1847 he died at Genoa on his way to Rome for his health.

OCTAVIA (c. 70-11 B. C.). Noble Roman lady of great beauty and character, who was the daughter of Caius Octavius, and sister of the emperor Augustus Caesar. She married Gaius Marcellus, a consistent enemy of Julius Caesar. After the death of her husband in 41, she married Marcus Antoninus for the purpose of keeping peace among the rulers of Rome. Though her efforts were successful for a time, in 36 Antony went off to the Parthian War and resumed his friendship with Cleopatra, the queen of Egypt. Octavia tried in vain to reconcile him, and even sent him troops and money to prosecute his campaigns, but he divorced her in 32. After the death of Antony, Octavia not only brought up their children, but also those of Antony and Cleopatra.

OLD IRONSIDES. See the frigate *Constitution*.

OLYMPIAD. Poetic and athletic reckoning of the dates of events in Greece from 776 B. C. to 394 A. D. Since the olympic athletic games were held every four years, time was recorded in periods of fours. The first victor was Corebus in 776, and often or usually the periods were named for the victor in the sports, especially in running. Timeus of Sicily first arranged chronology into olympic periods, attaching the names of winners to most of them; and other historians like Polybius, Didorus Siculus, and Dionysius followed. The games themselves were abolished in 394 by Theodosius the Great. To transform olympiads into regular years (or the ordinary chronology of Greece in business), take the number of the olympiad, multiply this by four, and subtract the product from 776, which process will give the date B. C. of an event. Any date falling after the middle of the summer makes it necessary to subtract one from the total, for the Attic new year and the games both fell in midsummer. Beginning with a race at Athens in 1896, and with certain events at the St. Louis Exposition in 1900, the ancient olympic games have been revived. The meet in London in 1908 was the first representative competition attended by contestants from many nations.

OPIUM WAR. When the Chinese tried to restrict the importation of opium from India, Great Britain declared war in 1840. Two years later the Chinese submitted by signing the treaty of Nanking, which provided for the opening of ports of China to trade, for a considerable indemnity, and for ceding the port of Hong Kong to Great Britain. In 1911 both nations entered into an agreement to curb the growing of opium. China was to reduce the cultivation of opium as Great Britain diminished the importation into China from India. This agreement culminated in 1917 when the terms were fully carried out, and both growth and importation ceased. When political conditions in China became uncertain, the trade was resumed, and after the World War one function of the League of Nations was to regulate the opium traffic.

ORDINANCE OF 1787. Following the Revolutionary War, certain officers expected the new nation to grant them parcels of land in western territory. In 1786 an Ohio Company was organized in Boston to take charge of land west of New York, should a patent be granted. They offered to Congress to purchase this land, and the Ordinance of 1787 provided for this purpose. All the district south of the Great Lakes and as far as the Ohio River, and west from Pennsylvania to the Mississippi was to included. Not more than five states were to be made out of this Northwest Territory, as it was then named. When the inhabitants in a district reached 60,000, then a government could be formed; and provision was made for transacting regular business when the number came to be 5000. On April 7, 1788 the settlement of the new land began at Marietta, Ohio under the direction of Generals Rufus Putnam, Tupper, Varnum, and other Revolutionary officers. In three months a temporary government was set up with General Arthur St. Clair, who had been president of the Continental Congress, as the first resident governor. Thus the region was opened to settlement in what is now the states of Ohio, Indiana, Illinois, Michigan, Wisconsin, and a portion of Minnesota.

ORLEANS. Decisive battle of the world (1429) due to the French refusing to accept the Treaty of Troyes, which provided the French crown should descend to the heirs of King Henry V. of England, and that the two countries should be forever under one king. The last stand for monarchial independence was made at Orleans; besieged by the duke of Bedford, who held the Tourelles, a fortified position commanding Orleans. A peasant girl named Joan of Arc (Jeanne d'Arc) appeared claiming Divine authority to lead the French and deliver the country from the English. The French stormed and captured Tourelles; losing ammunition and supplies the English retreated, and the monarchial independence of France was assured. Later Joan of Arc was captured by the Burgundians, sold to the English, and burned as a witch at Rouen.

ORLEANS, LOUIS-PHILIPPE JOSEPH, DUKE OF (1747-93). Fifth duke of Orleans, who espoused liberal ideas, and adopted the name of *Philippe Egalité* (Equality). He was the leader of the 47 nobles who withdrew from their own class and joined the common people or *tiers etat* (third estate) during

the early days of the French Revolution. He sympathized with the American Revolution, joined the Mountain Party composed of those who favored democratic ideas, and voted for the death of Louis XIV. In 1793 he was accused of royalist sympathies, was tried, and went to the guillotine. His son, Louis Philippe, became king of France in 1830.

OSTEND MANIFESTO. A dispatch signed at Ostend, Belgium, in October, 1854, by James Buchanan, John Y. Mason, and Pierre Soulé, all United States ministers in Europe, declaring the advisability of the sale of Cuba by Spain to the United States and declaring that the United States would be justified in taking it by force in the event of the refusal of Spain to sell it. The declaration was not approved by any party in the United States, though the meeting of ministers was under the direction of President Pierce.

OSTROGOTHS. See article on *Goths*.

OTTAWA. Capital of the Dominion of Canada since 1858, a city of Carleton County at the Rideau Falls, which Champlain described in his account of his visit for June, 1613. From then to 1800 the site was on the fur route to the northwest, but no settlement was attempted. Philemon Hull of Woburn, Mass., in 1800 built a cabin on the north side of the portage by the falls, and in 1820 Nicholas Sparks cleared some land now in the center of Ottawa. Colonel John By was sent to build a canal from Kingston to Lake Ontario, at a cost of $2,500,000. It was little used for strategic purposes as originally designed. The city grew rapidly, was named Ottawa (instead of Bytown) in 1854, became the seat of government in 1858, and held the first general parliament in 1865.

PADUA. Important cathedral and art center in Venetia in northern Italy. Of considerable political importance in the days of the small Italian republics. Padua was ravaged by the Goths and Huns in 452. Native princes began to rule in 1100, and the university, founded in 1222, was famous throughout Europe. In 1405 the republic of Venice annexed the city and district of Padua, and so it remained until 1797, when the French took charge. From 1814 to 1866 Padua was under the sway of Austria. In 1545 Padua founded the oldest botanical garden of any size in Europe. Important artistic buildings are the churches of St. Anthony, dedicated to the patron saint of the city, and the Annunziata, which was decorated by Giotto. Fra Lippo Lippi, the celebrated artist, lived here for a time, as did Donatello, a great sculptor, and Mantagna, leader of a school of painters.

PALESTINE. Since Palestine has never been a united nation, this term has more of a geographical than a political significance. Being on the direct route of travel from Europe to Asia, this district was often overrun by conquering armies. Babylonia dominated from the 16th century B. C. until Egypt was able to expel the Hyksos or shepherd kings, and then extended the empire of the pharaos to the eastward about 1450 B. C. Two centuries later, the Israelites and Philistines contended for possession of Palestine. About 1030 B. C. a dual kingdom was set up, but about 933 B. C., this again divided into Israel and Judah. Israel was subdued by Assyria about 722, and Judah by Babylon once more in 586 B. C., when thousands of captives were carried to the lands about the Euphrates and the Tigris. Nehemiah and Ezra, two prophets of the Jews, flourished during the captivity; they were allowed to bring back a remnant of the Jewish people and to rebuild Jerusalem.

Then followed, in turn, the conquest of Alexander the Great of Macedon, once more the Egyptians, then the Seleucid empire beginning with Antiochus III in 223 B. C., and at last Roman rule from 63 B. C. for a little over a century. In 70 A. D. Jerusalem was destroyed once more. From then to 1918 there was a succession of Latin, Egyptian, and Turkish dominion in Palestine. (See article on *Crusades*.) In 1918 the armies of Great Britain, in the battle of Samaria and others, drove the Turks out, and the League of Nations gave the British a mandate over the region in 1922. Constant troubles culminating in serious riots in 1936 have followed between the Arab and Jewish interests, which for many years have clashed in the entire region of the Near East. The Arabs resented the attempts of Zionists and others to refound a Jewish state in Asia Minor. See articles on *Hebrews*, *Jews*, *Jerusalem*, and *Zionism*.

PALMYRA. Ancient oasis city in Syria, 145 miles northeast of Damascus, once rich and powerful, now hardly more than a conglomeration of huts. Following campaigns by Mark Antony in 41 B. C., the Romans ruled in this region for four centuries. For rebellion Trajan almost razed the city to the ground, but Hadrian rebuilt it and gave it his own name. Under Odenatus, and his queen Zenobia later, Palmyra became virtually independent and governed much territory. After a conquest, a subsequent rebellion, and a long siege in 272, Aurelian, emperor of Rome, put many of the citizens to death. Palmyra never after that regained her former glories. Today the site is noted for its magnificent ruins, chiefly tombs of great architectural skill and uncommon beauty.

PANAMA. This republic on an isthmus of the same name between the Americas was settled at Porto Bello in 1502 by Columbus. From there Balboa set out on his travels, ending in the discovery of the Pacific from a high peak to the westward on the isthmus. After the revolution of 1821 freed the South American countries from the rule of Spain, Panama was a part of the dominion of Colombia. Because of geographical and political differences, Panama became autonomous from 1855 to 1885. Finally, late in 1903, the isthmus cut away entirely from Colombia. A treaty for building the canal across Panama followed soon. This agreement was modified in later years. In 1935 the United States declared herself no longer responsible for stability in Panama.

PANAMA CANAL. Between 1515 and 1525 surveys were made for a canal across the Isthmus of Panama. Nothing definite was done until 1875, when a French company obtained a concession. Under the leadership of Ferdinand de Lesseps, in 1879 a congress of 135 delegates met in Paris, and decided that a water-level canal was best. In 1880 de Lesseps acquired the rights granted in 1878. Lack of money and sanitary difficulties, such as prevalence of yellow fever, prevented actual digging until 1885. A United States commission advised a canal across Nicaragua. When the French company fell into difficulties and bankruptcy, the machinery and rights were purchased in 1901 by the United States. American interests thereby acquired a strip five miles wide on either side of the canal, together with rights to policing, sanitation, and other arrangements. Panama was to receive $40,000,000, in yearly payments after nine years, and $10,000,000 in cash. Colombia presented a bill for damages because of the secession of Panama, and in 1924 $25,000,000 was paid by the United States. Actual construction started in 1907, and boats were able to go through on Aug. 14, 1914; but slides and other troubles delayed the official opening until 1920. The total cost up to June 30, 1934 was $543,744,707. Revenues for the year ending June 30, 1935 were $15,540,723 net, which was $771,618 short of paying the interest charges on the investment.

PAN-AMERICAN UNION. Since 1826 six conferences of republics in the new world have been held. Simon Bolivar called the first, but the resolutions enacted there were never ratified. In 1856 Peru, Chile, and Ecuador agreed to promote a union, but also showed hostility to the United States because of the filibustering of William Walker, an American citizen. Conferences were held in 1864, 1878, 1888-89, out of which last grew the Pan-American Union, which has maintained an office in Washington, D. C., since 1890, the present name being adopted in 1928. In 1910 Andrew Carnegie gave three-fourths of the $1,000,000 needed to build a home for the office in Washington. Conferences in 1906, 1910, and especially in 1928 made considerable progress, since they came to agreements on arbitration, collection of international debts, patent rights, sanitation, and commercial cooperation. Various special conferences have also been organized, such as one on science in 1908, education in 1918, commerce in 1919, sanitation in 1920, and law in 1928. The Union maintains a large library of books and important maps of the western world, publishes monthly bulletins, and often special ones like those on agriculture, hygiene, finance, and child welfare.

PAPACY. By 400 of our Christian calendar, the Bishop of Rome had become the acknowledged head of the church in the west. Leo I (440-61) strengthened the claims of the papacy at the Council of Chalcedon in 451. Gregory the Great (590-604), confirmed the temporal power when he dealt with

the Franks in their struggle against the Lombards. Leo III crowned Charlemagne as emperor of the Romans when he knelt in prayer in St. Peter's in Rome on Christmas Day in 800. In the next two centuries, however, the power of the Popes declined. When Hildebrand came to the papal throne in 1073, he instituted ecclesiastical and moral reforms. Innocent III (1198-1216) was powerful enough to compel John Lackland, the king of England, to accept the Pope's nominee as archbishop of Canterbury and to acknowledge supremacy of Rome. Almost two centuries later, Philip IV of France won his contention with Boniface VIII (1294-1303), who claimed the right to tax the land in France. Then followed the exile of the Popes at Avignon, France, from 1309 to 1376, and afterward the schism at which time often two Popes claimed exclusive right to authority. After the Council of Constance, new vigor and reforms led to greater authority throughout Europe. In the 17th century France gave the Popes no end of trouble. In the 19th century two able Pontiffs, Pius IX (1846-1878) and Leo XIII (1878-1903) increased the influence of the church. The Vatican Council of 1870 formulated the doctrine of papal infallibility; but the formation of the Italian kingdom in that year terminated the temporal power of the papacy until 1929. See article on the *Papal States*.

PAPAL STATES. This phrase was applied to the dominions of the Pope in central Italy. Beginning with a gift of land by Pepin in 754, the holdings of the Holy See increased to include much of the territory north of Rome, such as Avignon, Bologna, and Ferrara. Most of this was comprised in Napoleon's short-lived Kingdom of Italy. In 1801 and 1814 the papal lands were restored to the church, until they were again united with other districts to form modern Italy in 1870. In protest for the loss of his temporal power, the Pope remained in the Vatican area, until in 1929 an agreement was reached with Mussolini, according to which the Pope again was acknowledged head of Vatican State. After this the Pontiff could travel outside the Vatican grounds, and since then he has spent his summers at Castel Gandolfo, about 15 miles from Rome. Vatican City covers 13 acres, St. Peter's, the Vatican Palace, the great Museum, and other structures. In 1935 the civil and legal systems were revised.

PARAGUAY. Sebastian Cabot built a fort in what is now Paraguay in 1527, and before long the native Indians had been absorbed or reduced to peonage. In 1542 the Jesuits came and all but ruled the land for over 200 years, until they were expelled in 1769. After gaining independence from Spain, Paraguay was ruled by different members of the Francia family until the last one was killed in battle in 1870. Brazil, Uruguay, and Argentina (which once had been part of the general district including Paraguay) made war and almost exterminated the Paraguayans between 1865 and 1870. The population fell from about 1,340,000 to 28,700 men, 106,000 women over 15, and 86,000 children in 1870. The Constitution granted in 1870 has been revised several times in minor respects. Numerous revolutions and changes in governments prevented much progress from 1875 to 1895. For upwards of 100 years, Bolivia and Paraguay have disputed over the boundary line of the Gran Chaco, a district of some importance. Col. Franco secured control of the government by a *coup d'etat* in 1936. See article on *Bolivia*.

PARIS. First mentioned by Caesar as Lutetia, but later named Paris because of the Parisii, who lived on the island which formed the main city for some time. Later the quarter on the right bank of the Seine was named the Ville, and the University district was called the Latin Quarter, it being on the left bank. Paris joined the Armorican League in 410, but was taken by Clovis, who made it his capital and built there a great church after his conversion. After years of decline, save for the reign of Dagobert (628-38), Pepin in 751 was allowed by Pope Zachary to assume the title of king. In the reign of Charlemagne (768-814), Paris became a place of commerce, guilds, and hospitality. Raids by the Norsemen began in 845, when much of the city was burned, and they were bought off at last by a present of 7000 pounds of silver. Other periods of invasion began in 876, 885, and the next year, when Charles the Fat again paid them to desist. King Eudes defeated these Vikings in 892, and from then on Paris was overlooked, but the districts north of the city were often afterwards plundered by roving bands.

In 987 Paris became the permanent capital of the district under Hugh Capet, who founded a line of kings that ruled until the Revolution of 1793. Under Robert the Pious (996-1031), many great buildings sprang up; under Henri I (1031-60) St. Martin des Champs, which had been greatly damaged by the Norsemen, was rebuilt into a magnificent church; under Louis VI (1108-37), the city was much expanded; and under Philip Augustus (1180-1226) and his successor Louis IX (1226-70), called the Saint, such structures were completed as the choir of Notre Dame, the Louvre as a chateau with a moat, the Sorbonne of the University, and a wall about the city eight feet thick, with 24 gates, and 500 towers. Paris was then the intellectual center of the world. Some of the main events of the next three centuries were the rise of the common people (tiers etát), the English invasions and further fortification of the city, enlargement of the Louvre and making it into a palace rather than a fortress, foundation of the royal library, introduction of printing in 1470, the massacre of St. Bartholomew in 1572, building of the Tuileries palace and the Hotel de Ville.

The chief political periods were those of Charles V (1364-1380) and of the Medici after 1550. Other structures were the new bridges in 1614 and 1621, for the first time built of stone, and the national library and other structures under Louis XIV (1638-1715), a reign remarkable for its length and evidences of progress. Little was done to beautify or modernize the city until about 1806 in the time of Napoleon. New streets, additions and improvements of many buildings, such as the Louvre, many public monuments, boulevards, museums, galleries, new buildings for the University of Paris, parks,. and government buildings are signs of progress under the Napoleons and the early Republics. Paris for over a century has been the mecca for art lovers. Little damage was done to the public buildings by air-raids in the World War. Some 266 people were killed and 603 wounded in these aerial attacks.

PARLIAMENT. As an outgrowth of the early *witenagemot* of old English times, the British Parliament has become "Mother" to most of those representative legislative assemblies of modern nations. The early councils under the Anglo-Saxon kings were replaced by William the Norman with a *curia regis* or body of officers of church and state, with others as he chose to summon. Until after King John was forced to grant the Magna Carta, Parliament was largely judicial. When both barons and commons (mainly the people of London and vicinity) rose together against the royal authority, even two years before the great charter, John had to recognize at St. Albans an advisory body. Simon de Montfort, the great baron and known as Earl of Leicester, in 1265 summoned two from each shire and two from each of 21 cities,—the first parliament like modern ones. In 1295, Edward I convened men from five groups:—higher clergy, lower clergy, nobility, knights, and burgesses. By 1332 these parties had become two,—nobility and higher clergy (even then called House of Lords), and another body or house, composed of knights and burgesses, also called a House of Commons.

After 1600 the idea of hereditary membership of the House of Lords was firmly established, and so remained until in the 19th century attempts were made to designate members for life only, and some were then created with that stipulation. (See article on *Parliament* in department of *Government* in this book.) During the reign of Henry VIII and others before Elizabeth, the houses had little influence, but by 1600 they were relatively powerful, and in 1688 it was decreed that the crown was responsible to Parliament. In 1707 the parliaments of England and Scotland were united, and that of Ireland in 1801 joined the "union." Sixteen lords from Scotland were added to the House of Lords, and 45 (later 70) to the House of Commons. Likewise in 1801, 28 Irish peers (elected for life) entered the House of Lords, and 100 (later 103) entered the Commons. Scotch lords were elected for short terms. In 1921 the total membership of the House of Commons was 670, but this was reduced to 613 when the Irish Free State was established, 13 members continuing in the united parliament from Northern Ireland. In 1832 the Reform Bill abolished 56 boroughs having less than 2000 inhabitants, and added nearly 500,000 new voters. About this time the old Tories became known as Conservatives, and the Whigs as Liberals, terms still in vogue. Secret

ballot was established in 1872. The franchise was extended to more voters in 1884, 1911, 1918, and 1928. In 1918 women were allowed to vote if they were at least 30 years old, men if 19, without property qualification. The first woman to sit in Parliament was Vicountess Astor (who was born in America) in 1919.

PASSION PLAY. During the Middle Ages passion plays were enacted in Provence, North Italy, France, Spain, Portugal, and England. In several countries of Latin America, they are still to be seen, some of them being produced by Indians. In the 18th century many of these productions were forbidden by law, save chiefly the one long famous at Oberammergau, a village 64 miles from Munich in Bavaria, Germany. This play was first enacted in 1633 as a thanksgiving for relief from the scourge of the Black Death. It was repeated every ten years from 1634 to 1674, then on decimal years, save an omission in 1870 on account of the Franco-Prussian War, and postponement of the acting from 1920 to 1922. The oldest text, written probably by monks, dates from 1662; the music was written in 1814 by the parish schoolmaster. Over 700 characters take part, including orchestra of 50 and chorus of 46. Actors are trained to live their parts off the stage. Anton Lang, who played the Christ in 1900, 1910, and 1922, is perhaps the most celebrated of modern actors in the Oberammergau drama. The main scenes concern the last week of the life of Christ; tableaux between each two of the 18 acts, however, show Old Testament stories, like the Sacrifice of Isaac. Some attempts in America have been made to imitate this celebrated play; but the one in Bavaria remains not only the oldest but the most revered of all such performances. The residents of the village make toys and pottery, crucifixes, and other religious symbols for export to many lands.

PATRICIANS AND PLEBEIANS. Names of the two political and social classes of ancient Rome. The patricians were from the old native families; the plebeians included freemen. The plebeian class grew by a process of evolution, according to some historians, including native-born but perhaps poor men, aliens or slaves who had been freed, and finally conquered people, who rose to power and got too strong for the old Roman families. For a long time only the patricians had voting and political rights, but the others clamored and fought for recognition. Servius Tullius imposed duties on the plebeians, enrolled them in the army, and gave them some voice in debating and governing. When the republic was established, the plebeians had been unable to marry patricians, and to hold offices of any authority, but could be taxed, serve in the army, and be responsible for duties, such as voting. In 494 B. C. the class organized into a solid group, and proceeded to obtain rights like that of marriage with patricians, membership in the senate, and other honors or offices. In time the *plebs* (as they came to be called) restricted the rights of the patricians, whom they greatly outnumbered. The old families were content to be shut out of offices, so long as their rank and reputation as patricians were guaranteed.

PATROONS. Under the Dutch of New York, then New Netherlands, the patroons were proprietors of manors or estates of immense size along the Hudson granted by the government. Families like the Schuylers, the Van Rensselaers, long enjoyed special privileges. This type of feudalism continued under the English from 1664 to 1775, while the descendants in the male lines were granted the property from generation to generation. After the great estates were broken up, the original proprietors (or their descendants) still tried to collect the rents. Such attempts led to riots in 1839, and the Anti-Rent Convention of 1845, after which the privileges were allowed to lapse.

PAUSANIAS (5th century B. C.). A Spartan general and ruler, who was a nephew of Leonidas and commander of the Greeks in the battle of Platea in 479 B. C. He defeated the Persian hosts, and the leader, Mardonius, was slain. Two years later, Pausanias led the fleet and land force that captured Byzantium; but he was driven from there by the Athenian general, Cimon. Then he conspired with the Persian commander, Xerxes, on condition that he was to rule Greece under Persian authority. When the plot was revealed in Greece, Pausanias fled to the temple of Athene. The Athenians blocked up the door with stones, and he was allowed to starve to death.

PEIPING (PEKING). Name restored to Peiping in 1928 as in ancient times. Capital of the empire of China from 1267 to 1368, and from 1421 to 1928. Near the site of the modern city, the Chou Dynasty about 1200 B. C. established a provincial capital called Ch'i. About 221 B. C. the Han Dynasty destroyed this place, and built instead Yuchow. In 986 A. D. the name was Nan-Ching, and a huge wall was built around the city. In 1122 part of the so-called Golden Horde of Tartars made this one of their three capitals, this being named Chung-Tu or Middle City. During the great Mogul empire, chiefly under Kublai Khan, Chung-Tu was rebuilt on a very magnificent scale. Here was the center of learning of the Orient. Marco Polo, of Venice, lived here under patronage of Kublai for about 20 years; the Pope sent an ambassador; and later the Jesuits obtained a foothold. Then shifts of political fortunes gave that region of China to the Mongols, and the name was changed to Khanbalig, meaning city of the great Khan, or in native Chinese Ta-tu, or Great Capital. During part of this time, the city of Nanking (meaning Southern Capital) was more important and was the main center of government. Meanwhile, the name of the northern capital had again been changed to Peiping, or City of the Great Peace. Here the third Ming emperor in 1421 set up his government, and called the city Peking, meaning Northern Capital.

So, with the changes in name, we get a cross-section of the history, and the significance of the different dynasties in China. The north never has been safe from incursions from other nations, such as the Tartars, Tatars, Mongols, and Manchus. When the Manchus conquered China in 1644, they moved the capital of their empire from Mukden to Peking, and there they remained until the revolution of 1911 expelled that dynasty, a republic was set up, and Dr. Sun Yat-sen became first president of China. Once more in 1928, the Nationalists under General Chiang Kai Shek moved the seat of government to Nanking. Since that time Peking has suffered from neglect and declined in influence. In the last decades the city was greatly modernized, and an extensive foreign quarter sprang up. Peiping is noted for its various great buildings and monuments to the past, such as the imperial buildings within the Inner or Forbidden City, which in itself is enclosed within the old Tartar or Imperial quarters, the Legations of foreign powers, the Lama Temple, Hall of Classics, and Temple of Confucius.

PELOPONNESIAN WAR. Between 431 and 404 B. C., Athens and Sparta led different groups contending for supremacy in Greece. Athens was democratic, but had a strong opposing party; Sparta was almost entirely aristocratic, and ruled by a few men. The first stage of the war ended in 421, at which time the conservatives at Athens gained control, and under Nicias made a truce with Sparta. Meanwhile, a great plague had carried off thousands of inhabitants, including the great leader, Pericles. Both parties waited to get their breath. Next, Athens led a league against Sparta, but suffered a check in the battle of Mantinea in 418. Planning to annoy their rivals, the Spartans next sent an ill-fated expedition against Syracuse in Sicily. Alcibiades, an unprincipled but rather popular youth, was one of the leaders; Nicias was another. The fleet against Syracuse consisted of 134 ships. Alcibiades was recalled on the charge of impiety, and Licias lost heart in the struggle, which had been against his advice in the beginning. Athens was beaten in a sea fight, most of the ships were burned, and the army tried to escape by a forced march on land, but the entire force was cut to pieces, and the general of the land forces, Demosthenes, was killed. Yet Athens refused to give up the struggle against her rivals. Alciabiades was recalled, and some land successes followed, but the Spartan admiral gained a great victory at Aegespotami in 405 B. C. Meanwhile Alcibiades had gone over to Sparta and the aristocrats. Athens was reduced to subjection, the Spartans entered the citadel, and under their authority the city was ruled by the Thirty Tyrants, while all who opposed were driven from the city.

PENINSULAR WAR. Portugal resisted the schemes of Napoleon to control all of Europe. He made a secret treaty with Spain in October 1807, by which Portugal was to be divided. The French seized the capital of Portugal, and the royal family

then fled to Brazil. Internal trouble in Spain followed, and so Napoleon finally gave the throne to his brother, Joseph Bonaparte. Then the Spanish declared in favor of Ferdinand VII. Portugal and Spain joined with England in a campaign which began in 1807 and ended in 1814. Napoleon in person led the French army into Spain, after having made a peace with Russia, and entered Madrid on Dec. 4, 1808. On Jan. 16, 1809 the English won a battle at Corunna, Napoleon having returned to France, but the able British leader, Sir John Moore, died of wounds. Some of the later engagements were fought at Talavera (1809), Busaco (1810), Barossa (1811), Badajoz (1811), Saguntum (1811), Salamanca (1812), Vittoria (1813), after which Joseph Bonaparte returned in haste to France. Following the defeat at Toulouse in 1814, the French were gradually forced to capitulate. The French marshal, Soult, showed great ability, but superior forces and better generalship of Arthur Wellesley, Duke of Wellington, finally forced the French to give up their attempts to dominate Portugal.

PENN, WILLIAM (1644-1718). An English Quaker; the founder of the colony of Pennsylvania. Born in London; son of Admiral Sir William Penn; the son received the grant of land in North America in payment of a sum of money lent to the crown by his father; his object was to establish a home where his co-religionists might worship in peace; came to America and founded the city of Philadelphia (1682); signed a treaty with the Indians which remained unbroken (1683); on the accession of William III. to the throne of England (1688), the government of Pennsylvania was taken from Penn, but was restored finally. Penn returned to England, and to his life of preaching; his Quaker agent, Scott, mismanaged affairs, and involved him in debt and financial ruin.

PERMANENT COURT OF INTERNATIONAL JUSTICE. See articles on *World Court* and the *Hague.*

PERRY, MATTHEW CALBRAITH (1794-1858). After serving in different grades of the United States Navy, he was made a captain in 1837, then the highest rank in the service. In 1838-9 he commanded the *Fulton II*, the first steam vessel. Having received the honorary rank of commodore, he went to Africa to suppress the slave trade, under provisions of the Webster-Ashburton Treaty. With six warships, in 1846 he captured some towns on the Mexican coast, separated Yucatan from Mexico, and, after bombardment of the town, landed forces at Vera Cruz. President Fillmore authorized him to take about 300 men on a cruise of the Pacific. On July 14, 1853 he went ashore in Japan, met some commissioners who had been appointed to receive him, and requested that the ports of Japan be opened to American vessels. By agreement he returned on Feb. 14, 1854 for the reply, concluded a treaty after some hesitation on the part of the natives, and this was ratified finally Feb. 21 of the following year. The treaty provided that Simoda and Hakodate should be open to receive American ships, that Americans should be allowed to buy provisions there, that Japan should assist shipwrecked vessels and sailors, and that any privileges granted later to other nations would also be given the United States.

PERRY, OLIVER HAZARD (1785-1819). An American naval officer; born at South Kingston, R. I.; entered the navy (1799); served in the war against Tripoli; commissioned lieutenant and commanded a flotilla (1807); at the outbreak of the War of 1812 he commanded at Sackett's Harbor under Commodore Chauncey; made captain and master-commandant to superintend the construction of a fleet (1813); won a victory from the British on Lake Erie (September 10, 1813), which battle gave the Americans control over the lake. Perry served with Decatur's squadron in the Mediterranean; dispatched to the West Indies to protect American commerce; he died of yellow fever at Trinidad; was buried with military honors but the body was removed to Rhode Island and reinterred.

PERSEPOLIS. Once known as "the glory of the East," Persepolis or Persia City was the capital of the great conquerors Darius, Xerxes, and Artaxerxes. Though not always a royal residence as Babylon, Susa, Ecbatna were, this place had a royal treasury and the tombs of kings. Alexander the Great found here immense treasures, to which he helped himself, but he seems to have spared the city, though an ancient story mentions that he fired the great palace with his own hand in connection with a revel. Istakhr, later at the same place or near, was a stronghold and seat of authority, which resisted the conquests of Islam, but by 900 had sunk to a place of little importance. The glory of Persepolis is its great collection of ruins. Some of these are the Forty Pillars, immense and of superb construction; three sepulchres hewn out of the solid rock and richly ornamented; four others eight miles away, cut out of rock and high over the valley; the ruins of the palace destroyed by Alexander; and the ruins of several colossal structures built of dark-gray marble on a high terrace.

PERSHING, JOHN JOSEPH (1860-). American commander-in-chief in the World War, was born in Missouri, educated at Kirksville Normal School and at West Point, where he was graduated in 1886. He served in several Indian campaigns, in the war in Cuba, in the Philippines at two different times, was military observer in the army of General Kuroki for six months in 1905 during the Russian-Japanese War. He commanded the eighth brigade at the Presidio, San Francisco, and here his wife and three daughters were burned to death August 27th, 1915. On duty temporarily on the Mexican border in 1916, he was sent into Mexico in pursuit of Villa. As commander of the American forces in Europe, he placed the United States Army at the services of General Foch as allied generalissimo. In June, 1918, part of General Pershing's men began to drive back the Germans and won the offense at Château Thierry and Belleau Wood, followed by the victory at Soissons during the next month. In the middle of September the American troops captured the St. Mihiel salient, fought the battles of the Argonne and the Meuse in October, and by November 7 had pushed on as far as Sedan, when the preparations for the armistice commenced. On September 4, 1919, the Senate confirmed Pershing as "General of the Armies of the United States," and from July, 1921, to his retirement in 1924, he was chief of staff.

PERSIA OR IRAN. From ancient times Persia has been the home of Aryan stocks, but little is known in detail of history there until the Medes paid tribute to Assyria about 836 B. C. By 550 B. C., in the time of Cyrus, the Medes, Persians, Parthians, and Bactrians united for common protection. Cyrus dominated much of Asia, from the Euphrates to the Mediterranean, and died fighting in 528 B. C. After two weak rulers, Darius established order, pushed his borders to what is modern Russia, and sought to humble the Greeks. His hosts met defeat at Marathon, and his son, Xerxes, in 480 B. C. was utterly routed in the naval battle of Salamis. Alexander found Persia an easy conquest, and the Parthians for three centuries ruled after him.

In 228 of the Christian era, the Sassaniad dynasty restored much of the glory of ancient Persia. After winning the battle of Navahad in 639, the Mohammedans set up a caliphate at Bagdad, but dissensions prevented national union. Next, the Moguls came in 1226, with Genghis Khan; the Tatars a century later with Timur or Tamerlane; then the Uzbeks some 16 years later; and the Safavis from 1499 to 1736. The fringes of the Persian empire fell away during this last period. Georgia went to Russia in 1802, and Armenia broke away in 1828. Great Britain fought to quiet the restless and fierce tribes in 1837 and 1857, while Persia still had visions of the return of ancient splendors. Finally, in 1907 Russia and England agreed as to their respective spheres of influence in Persia. When Mohammed Ali, the shah or king, 1906, granted a constitution, Iran ceased to be an absolute monarchy. For the first time a national legislature was authorized. Internal turmoil for 20 years ended with the deposition of Shah Ahmed Mirza (1898-1930) in 1924, the abolition of the Kajar dynasty in 1925, and the establishment of Mirza Pahlevi as hereditary shah in 1926. When a British oil concession along the Persian gulf, richest oil field in the world, was cancelled in 1932, the resulting controversy was settled by the League of Nations. On March 22, 1935 the government changed the name of Persia to Iran, thus restoring its ancient title.

PERU. Long before Pizarro came in 1531 to disturb their peace, the Incas for five centuries had been building a government in what is now Peru. This government resembled some modern republics. The successors of the ancient Incas finally joined the

revolutionary movements in South America in 1821. Gen. San Martin of the Argentine assisted the Peruvians in winning their complete freedom in the battle of Ayucucho in 1824. The north part of the country was then organized and called Bolivia in honor of Gen. Simon Bolivar. Uncertainty followed for many years, save in the terms of Ramon Castilla, lasting 10 years, at two different times. Pres. Balta in 1868 began an era of reckless spending, but his successor, Don Manuel Pardo, tried his best to overcome the fatal effects. Following disputes of long standing, Bolivia and Peru were involved in war with Chile in 1879, after which in 1882, the valuable nitrate district of Tarapaca was ceded to Chile. Other districts, called Tacna and Arica, were given to the control of Chile for 10 years, to be followed by a plebiscite. Conditions delayed the voting. In 1929, the United States brought about a peaceful settlement through arbitration. Arica remained with Chile, but the Peruvian flag was at last hoisted over Tacna on Aug. 29. The presidents of Peru, 1915 to 1933, were Dr. José Pardo, to 1919; Augusto B. Laguia, to 1930; Luis Sancho Cerro, to April 30, 1933, when he was assassinated. A new constitution was granted in 1933 and Gen. O. R. Benavides became president.

PETAIN, HENRI PHILLIPE (1856-). French general, widely known on account of his lectures at the Ecole de Guerre. At the outbreak of the World War he was a colonel of infantry. Was promoted general in the French Army in 1914 by reason of his masterly command of the French retreat from Charleroi to the Marne. At Artois, May, 1915, Petain's corps took Carency, breaking the German front. When the Germans carried the outer works of Verdun February 21-24, 1916, Petain was chosen to defend the fortress. He successfully resisted the Germans in the most costly series of attacks ever made on a single position. During the Allied offensive in 1918, Petain was commander-in-chief of the French armies. On the occupation of Metz in 1918 was made a marshal of France.

PETERSBURG. Though the North had lost heavily in the battle of the Wilderness, Gen. U. S. Grant saw that Richmond, capital of the Confederacy, must be taken at all costs. Petersburg had to be captured first, and the city was besieged from June 15, 1864 to March 29, 1865. An attack in June cost the federal army of Gen. W. F. Smith and others some 9000 men. After an explosion of a mine that was disastrous to the Confederates, a new attack on them was made in July, costing the North 4000 more men. After other assaults along the lines, Gen. Phil Sheridan was sent to oppose Gen. Early in the Shenandoah Valley. Gen. Johnston had to withdraw to combat the destructive tactics of the Northern general, W. T. Sherman, in Mississippi and Georgia. These conditions forced Lee to fall back and prepare to evacuate Richmond. With his army reduced from 55,000 men to scarcely half that number, Lee felt obliged to surrender on April 2, 1865. Thus the Petersburg campaign was the last important stand of the Confederate forces.

PHILADELPHIA. Philadelphia cherishes the ancient shrines where the American Union was formed, such as Old Independence Hall, once the statehouse of Pennsylvania, planned by Alexander Hamilton, the first home of the Supreme Court; next door to Independence Hall, another building where the first Congress sat; the house where Betsey Ross made an American flag; the grave of Franklin; and the historic mansion known as Cliveden, on the battlefield of Germantown. For other features of the city, see the article on *Fifteen Largest Cities*.

PHILIPPINES. Magellan made this archipelago known to Europe in 1521. Hindu and Chinese culture existed there centuries before. The Spanish brought the islands into subjection in 1565, except the district of the Moros or native Mohammedans, so named from the Spanish word *Moro* or Moor. In 1577 Sir Francis Drake touched at the islands; and the following year Cavendish tried to capture the ship-base at Iloilo. The Portuguese, before 1600; the Dutch in 1597; the British in 1572 and 1809 established commercial relations with the Filipinos, and several skirmishes with the natives occurred meanwhile. Feeling for independence from Spain grew until in 1896 a revolution was headed by Emilio Aguinaldo, an able native chieftain with foreign experience and education. In 1897 a truce with Spain was followed early the next year by the war between the United States and Spain. On May 1 Admiral Dewey destroyed the Spanish fleet in Manila Bay, and in August General Merritt captured the city of Manila. The Treaty of Paris (1898) ceded the islands to the United States, and compensation was made to the Spanish friars for their interests there. Aguinaldo declared allegiance to the United States in March 1901, and the insurrection ended in 1902. The natives had proclaimed their freedom on June 12, 1898, setting up a temporary republic with Aguinaldo as first president.

From the Treaty of Paris until 1935 the United States exercised control through a governor general of the Philippines. Much progress in sanitation, education, and government was made during these years. Congress passed over President Hoover's veto a modified independence measure in 1932, but the Filipinos rejected this. One more favorable to the islands was enacted in 1934, and on May 1, the 36th anniversary of Dewey's victory, this was accepted by the Filipino Assembly. On Nov. 15, 1935, Frank Murphy retired as governor general, and the new commonwealth of the Philippines came into being with Manuel Quezon as president. After ten years of this transitional government, the islands are to be completely independent.

PHILISTINES. Early vigorous people, now thought to have migrated from Crete to the land between Joppa and the Egyptian desert south of Gaza. The Greek word Palestine is a form akin to Philistine. Little is known of these people save what is found in the *Bible* in Joshua, Samuel, Judges, and Kings, where various references are confusing. It seems that Samuel, Saul, and David at different times fought them (Sam. vii. 13, xiv. 47; II Sam. viii. 1). In 1116 B. C. Samuel defeated them at Mizpah; in 1087, Saul and his sons defeated them at Mishmash; and David slew their champion, Goliath, about 1063. Saul and his sons were killed in the battle against the Philistines about 1033 at Mt. Gilboa, but after David's time, in spite of frequent uprisings, they never became formidable. They paid tribute to Assyria in 802 B. C., and four of their five cities were vassals; then Egypt kept them in subjection; and finally Persia made the district about Gaza an important seat of provincial empire.

PHENICIA. Save for a few stray inscriptions, the *Bible* is once again our chief source of information about this district, until historical records begin with the Babylonian conquest in 1780 B. C. During the 18th dynasty in Egypt, Phenicia was a tributary, but about 1380 B. C. again became independent. After the Cretans no longer ruled the eastern Mediterranean, Phenicia extended her commerce to all the shores of the known world to the west. Sailors from there also settled at various spots along the coasts, such as Carthage, all of Spain, Sicily, Malta, and Sardinia. Under Hiram I, Tyre became the dominant Phenician state, in the time of David and Solomon. With Sidon and other smaller places, Tyre fell under domination of Assyria, but Sidon was destroyed after a rebellion in 678 B. C. Alexander the Great burned Tyre in 332 B. C. After other spoliations, in 65 B. C. Phenicia became a mere part of the colony of the Romans along the eastern Mediterranean.

PHOCION (fo-she-on) (402-317 B. C.). Athenian statesman and leader, the pupil of Plato and later friend of Zenocrates. He won fame at Naxos in 376 B. C., helped subdue a rebellion in Cyprus, and held the Athenians from taking too bold moves against Macedon as Demosthenes and other popular leaders advised. He secured lenient terms from Philip of Macedon after the disaster at Cheronea in 338 B. C. Without seeking the honor, Phocion was elected general forty-five times. Yet in 318 B. C., when the democracy was restored, he was deposed from office, brought to trial, and shouted down by the mob without an adequate hearing. He was put to death by drinking the hemlock. Within a short time the populace demanded public honors and a monument for him.

PILSUDSKI, JOSEF (1867-1935). General, first marshal, and president of Poland, who was born near Vilna, and early became an advocate for Polish liberty. He was banished to Siberia (1887-1892), joined the Social Democratic Party, and commanded the first Polish Legion against Russia in the Austrian campaign in the World War. From November 1918 to December 1922 he was dictator of Poland, being helped by the army, and again from May 1926 was in charge of the government for two years more, after which he took a place in the new cabinet of

President Bartel. Though his viewpoint was almost always that of a military man, he knew when to stop in his powers as virtual dictator of Poland, and so he held his influence for years.

PISA. An ancient city of Tuscany, founded about the sixth century B. C. It is first mentioned by Livy as Julia Pisana. In the fifth century B. C. it was subject to Rome, but was an independent community under the Carolingians. Sardinia was wrested from the Saracens by Pisa, with the aid of Genoa, in 1025. Pisa was a commercial and naval rival of Venice and Genoa; and in the twelfth and thirteenth centuries was at the height of her greatness. This came to an end when Genoa defeated the Pisan fleet off Meloria, in 1284. In 1399 the city was taken by the Milanese, and was sold to France six years later. Pisa became independent under the protection of Charles VIII. of France in 1494, but came under the rule of Florence again in 1509. From this time it began to decline and its history is a part of that of the Florentine State, and of Tuscany. Ecclesiastical councils were held at Pisa in 1134, 1409, and 1511. In 1600 Pisa had only about 15,000 inhabitants, where in the height of its greatness it had numbered 150,000. Some of the magnificent buildings of Pisa are the Gothic cathedral (1063-1118); the Campanile or bell-tower, eight stories high and leaning 16 feet from the perpendicular; and the University, with the church of St. John. Galileo was a native of Pisa.

PITTSBURGH LANDING, BATTLE OF. See under *Shiloh.*

PIZARRO, FRANCISCO (c. 1475-1541). Conqueror of Peru, who was born at Trujillo in Spain, received a scanty education, and went to the New World before 1510. He was with Balboa when the Pacific was discovered, and conceived the idea of conquering the rich lands to the southward. With a soldier and a priest he made an alliance, explored the coast alone with a few men as far south as 9°, and finally interested Spain in the idea of conquering the Incas of Peru. With his brother, Hernando, and a force of three ships, 180 men, and 27 horses, he sailed from Panama in Jan. 1531. By treachery he conquered the Incas, made them pay an immense ransom (now estimated at $17,000,000), sent part of this to Spain, and made the young Manco nominal ruler at Cuzco. In 1535 he founded Lima as a new capital. Two years later the Peruvians rebelled, but Pizarro's associate, the soldier, Diego de Almagro, defeated them. He and Pizarro quarreled, fought, and Almagro was beheaded. In 1541 his followers assassinated Pizarro. See article on *Peru.*

PLAGUE, BUBONIC. See under *Black Death.*

PLANTAGENETS. More correctly the Angevin house, which ruled in England from Henry II (1154) to the death of Richard III (1485). The male line became totally extinct in 1499. Geoffrey, Count of Anjou, married Maud (Matilda), the daughter of the late king Henry I. He used as a badge a sprig of the plantin or broom plant (*planta genet*). From this his nickname of Plantagenet arose. Previous to this time men were identified by adding the name of their birthplace or of some other place to their given names. Thus Edward I was called Edward Longshanks, and a brother was called Crouchback. The Angevin or Plantagenet kings are Henry II, Richard I, John, Henry III, Edward I, Edward III, Richard II, Henry IV, Henry VI, Edward IV, Edward V, and Richard III. Relatives of this noble house founded both the Lancaster and York families. See individual names in *Biography* section.

PLATEA. This city in western Beotia, six miles from Thebes, in early days allied with Athens and became a rival of Thebes and other Greek towns. When the Persians came in 490 B. C., Platea sent a force of 1000 men to assist Athens at the battle of Marathon. Ten years later the Thebans incited Xerxes, the Persian general, to attack Thebes, which was razed to the ground. Here again in 479 B. C. the Persian Mardonius was conquered by Athens and her allies, and Greece was forever freed from threats of invasion from the east. Platea was rebuilt, and great prosperity followed for 50 years, when wars again laid waste the district in 427 B. C. Again the town was rebuilt, but in 373 B. C. was once more razed by the Thebans, and finally restored by the Macedonians.

POITIERS. A town in western France famous for its antiquities but mainly because of the famous battle (1356) in the Hundred Years' War when the English under Edward the Black Prince defeated John, King of France. The French army outnumbered the English over five to one; they opened the battle with a furious charge of the mailclad men at arms, and only the marvelous work of the English longbowmen saved them from being ridden down and cut to pieces. The arrows shot, and the bows used by the English were fully twice as long as those in use by any other country; hence "the cloth yard shaft" as a term for the arrow. King John was taken prisoner.

POLAND. Since 1918 a republic composed of parts formerly of Russia, Prussia, and Austria-Hungary. After three partitions in 1772, 1793, and 1795, with further adjustments in 1815 by the Congress of Vienna, Poland lost her national identity until after the World War. The history of this country at various periods is one of great honor and progress. Poland gained independence under Mieczyslaw in 960, and under Boleslas (992-1025) pushed the boundaries beyond the Oder, Carpathians, and Dneister. Casimir the Great (1333-70) joined the Hanseatic League, the most powerful commercial body of that age. Sigismund I (1505-48), under whom Poland dominated central Europe, was at last forced to grant his subjects a constitution, and his son joined Lithuania to the Polish kingdom. John Casimir, however, in 1668 was forced to abdicate, when Russia, Sweden, Brandenburg, and the Cossaks attacked Poland. Eight years before this, Livonia had been granted to Sweden, and land beyond the Dneiper, to Russia.

After two partitions of the country, the Poles revolted in 1794, defeated the Russians and expelled the Prussians; but Austria sent an army, which helped the enemies of Kosciusco, the brave Polish general, to defeat and capture him. After the third partition, Poland ceased to be a separate kingdom. Following further disorders and revolts, Russia in 1832 incorporated Poland in the empire of the tsars. Despite several attempts to break away before the World War, none succeeded until Russia herself offered complete autonomy, but the Central Powers made a higher bid of complete national independence. Poland was, therefore, proclaimed an independent monarchy in 1916, and later chose to be a republic. Josef Pilsudski, general of the army, became a dictator, but knew just where to stop in his control over the people. He was ably assisted by the great pianist, Ignace Jan Paderewski, who went from the United States to Poland in 1918, became leader of the Conservative Party, and Premier and Minister of Foreign Affairs, from Jan. to Dec., 1919. For a country with such a stormy past, Poland has been remarkably quiet since 1920.

POLITICAL PARTIES, UNITED STATES. When the Constitution of the new nation was being ratified, those in favor of the central plan or concentration of government were called Federalists, those who opposed, Anti-Federalists. In the time of Jefferson, the latter came to be known as Republicans, Democratic-Republicans, and finally Democrats, a name still held by those who in theory (if not always in practice) have favored states rights and a strict construction of the Constitution. John Adams as a Federalist was President from 1797 to 1801, but in 1820-24 this party died, and the Democrats held office until 1841, when for one term Harrison and Tyler as Whigs were presidents, being succeeded until 1861 by the Democrats once more. With the advent of Abraham Lincoln, the Northern Whigs came to be called Republicans. This party continued in power until 1933 except for the two terms of Grover Cleveland, and two of Woodrow Wilson. See also under terms of the Presidents.

POMPEII. Ancient town on the Sarnus in the district of Naples in Italy. It was settled about 600 B. C., and by the beginning of the Christian era was a favorable residence place for wealthy Romans. On Feb. 5, 63 B. C., a severe earthquake damaged much of the city, and on Aug. 24, 79, Pompeii, Herculaneum, and other towns were completely buried in showers of dust and stones from Mount Vesuvius. About 2000 people were killed out of some 20,000. Others returned afterward and removed some of the treasures. The very site became lost until 1594, when some men, in making an underground aqueduct, discovered some remains. In 1763 excavations began, and in 1861 the Italian government took over the work on the plan of G. Fiorelli. Many interesting objects have been unearthed, and the

chief buildings are shown much as they were in original form. Some are the great amphitheatre seating some 20,000; the forum with paved footway and statues; and an exquisite Doric temple. Among the art objects are bronze statuettes, mural paintings, and mosaics of uncommon beauty, many of which are now in the museum at Naples. The domestic life of the time is completely revealed. Some of the inhabitants, in trying to escape, were crusted over with ashes in such a way as to be completely outlined in forms, from which casts have been made.

PORTER, DAVID DIXON (1813-1891). American naval officer, the son of Capt. David Porter, who at one time commanded the Mexican navy. Three brothers and a cousin were also in the United States navy. In the Mexican War he commanded the *Spitfire* at the bombardment of Vera Cruz, and in 1856 made trips to the Mediterranean to bring camels for service in the army in the southwest. During the Civil War he was sent to the relief of Ft. Pickens at Pensacola, and to blockade the Mississippi. In the expedition against New Orleans, commanded by his foster-brother, David G. Farragut, Porter was in charge of a mortar flotilla, which helped silence the forts in the harbor, and in the siege of Vicksburg he performed a similar service, for which Congress thanked him. In 1864 he tried to silence the fire of Fort Fisher, but the general on land refused to assault the works. On Jan. 15, 1865, in command of the largest fleet assembled at a single point during the Civil War, he helped take this fort. From 1865 to 1869 he was in charge at Annapolis, making important changes, including the introduction of athletics. He succeeded Farragut as admiral in 1870, the highest grade of the Navy.

PORTUGAL. In early centuries, the Iberian peninsula was divided into three main portions, one of which, corresponding somewhat to modern Portugal, was long known as Lusitania. Ferdinand of Castile obtained Portugal in the 11th century. Alfonso I, of his line, in 1143 made Portugal wholly independent; and a century later, Alfonso III, added the southern province to make the area about what Portugal has today. Alfonso I captured Lisbon in 1147, with the aid of Crusaders from England. John II tamed the feudal barons before the end of his reign in 1495. After the discovery of Brazil in 1500, Portugal entered upon a great period of colonial expansion. Progress later was halted by internal troubles with Jews and by emigration to the New World. In 1581 Philip II of Spain annexed Portugal to his own realm. After rebellions by Portuguese nobles, Spain finally again admitted independence of Portugal in 1668. In 1807 the regent of Portugal, John VI (reigning instead of his insane mother), fled to Brazil with his court. When France attempted to place the brother of Napoleon on the throne, Portugal objected, and the Peninsular War followed, in which England and Spain assisted to expel the French. King John left control in the hands of the English, but a revolt in 1820 brought him back to Portugal, where he signed a liberal constitution, and granted Brazil independence, with his son, Pedro, as emperor. Pedro IV resigned in favor of his daughter, a child of seven, whose uncle proclaimed himself king in 1828, but Pedro forced him to give up his pretensions in 1834, when the constitution of 1826 was reaffirmed. After a time of uncertainty, the brothers, Pedro V and Luiz I, between 1853 and 1889 restored Portugal to order and progress. Then Carlos succeeded, but he and the crown prince were assassinated in 1908. Then the second son, Manoel, reigned for two years, when he was deposed and went into exile in England. Since 1911 Portugal has been a republic, with frequent changes in ministry. In the World War, she sent troops to East Africa and France to aid the allies.

PRAGUE (PRAHHA). Prague is the capital of Bohemia and of Czechoslovakia, and is full of interesting memorials of former ages. Some of the interesting buildings are the Royal Palace, containing 440 rooms, set on a high hill, and extant from the 14th century; the Cathedral of St. Vitus, where the royal tombs are; the Tyn Church, containing the tomb of Tycho Brahe; and the University, founded in the 14th century, where John Huss was rector in 1402. Prague was founded by Germans about 1100, and has suffered much from wars, notably in the time of the Hussites; in the Thirty Years' War, when Frederick V. lost his crown; in 1744 when Frederick the Great took the city and when the royalists bombarded the town in 1848. The Prussians entered the city without bloodshed in 1866, after which a treaty was signed with Austria. From about 1800 the inhabitants of Bohemia began to look forward to national unity and independence, a dream realized at the close of the World War, when at Prague in the senate house the downfall of the Habsburgs was proclaimed.

PRIDE'S PURGE. During the Civil War between the forces of the British king and those of Parliament, events culminated in December, 1648. Thomas Pride, one of the Revolutionary generals, stationed himself at the entrance to the House of Commons on Dec. 6, and prevented from entering those Presbyterians and Royalist members who might side with King Charles I. About 100 members were thus excluded by this method, familiarly known as Pride's Purge. Thus rid of opposing members, the Commons proceeded to bring Charles to trial, Pride being one of the judges who signed his death warrant.

PRIVATEERS. In 1243 Henry III of England asserted his right to annoy shipping in France because he still claimed territory across the Channel. In 1295, England still claimed the district of Bayonne in France. Mariners of that region were then commissioned to prey on the commerce of Portugal because of alleged damage to English shipping. All early commissions by governments to private persons to prey on commerce were supposedly in the nature of reprisals for injuries. (See *Cinque Ports*). Drake, Hawkins, and others were licensed by Elizabeth's ministers, but Spain called them pirates. The French navy was crushed at La Hogue in 1692. From then to 1697 French privateers took 4200 prizes. Privateering was regarded somewhat as sniping or ambush warfare is on land. During the Revolution 1150 American privateers took 600 prizes; in the second war with England, 500 took 1350 prizes. Britain herself took numerous ones. In America, however, there was little real profit, compared with the expense and hazards involved, and 200 ships of the 500 licensed took none at all. Sweden and the United Provinces abolished privateering in 1675. The Declaration of Paris, 1856, abandoned the practice, but Spain, Mexico, and the United States did not agree. President Lincoln, during the Civil War, was given power to commission privateers, but did not exercise it. Pres. Davis of the Confederacy issued some licenses, and a few were tried for piracy in the federal or northern courts. Official ships of the navy were not considered privateers. See article on *Buccaneers* or *Pirates* and *Alabama Claims*.

PROGRESSIVE PARTY. This name was taken by two different third-party groups in 1912 and 1924 in the United States. Following opposition among certain members of Congress in 1910 to the rigid rules of procedure of the House, and the conservative tendencies of President Taft, objection to his renomination culminated in the withdrawal of Theodore Roosevelt and his delegates from the Republican Convention in 1912. Later Roosevelt was nominated on a Progressive or Bull Moose platform, and in fact poled more votes than did Mr. Taft. In consequence Woodrow Wilson, the Democratic nominee, was elected. Farmer, labor, and socialistic influences in 1924 caused the nomination of Senator R. M. LaFollette of Wisconsin on a platform called Progressive. He carried only his own state, but drew enough votes to secure election of Coolidge, the Republican nominee. See article on *Political Parties*.

PROHIBITION. Maine passed a prohibitory law against liquors in 1846, and Massachusetts, Rhode Island, and Vermont in 1852, though later repealed. Before 1900 Kansas, Iowa, and the Dakotas had tried similar legislation. Between 1907 and 1915, most of the Southern states followed suit, as did Arizona, Colorado, and Washington all in 1914. Only three states—Pennsylvania, New Jersey, and Nevada—had no restricting laws by 1915. In 1916 Michigan, Montana, South Dakota, Nebraska, and Utah joined the other states, making the total then 24, with an estimated population of over 30,000,000 people in prohibition areas. On Nov. 1, 1917 Congress forbad the manufacture of all intoxicants save beer and wine. On Dec. 17 the House voted 282 to 128 to submit the question to the states, and the Senate agreed by a rising vote the following day. On Jan. 16, 1919 the necessary 36 states ratified the XVIII Amendment to the Constitution. Eventually all ratified save Connecticut and Rhode Island. Congress passed the enforcement law proposed by Rep. Andrew J. Volstead of Minnesota in 1919, and later over the veto of President Wilson. By a

unanimous decision, the Supreme Court upheld the XVIII Amendment on June 7, 1920. Opposition intensified after 1925, with these results, Nevada in 1926 by vote expressed sentiment against the enforcement of the Volstead Act; Illinois advised modification in the same year; Montana refused to continue state cooperation in 1928; and Wisconsin and New York in 1929 weakened the enforcement laws. Growing out of this agitation, and out of the campaign promises of F. D. Roosevelt, the XVIII Amendment was finally repealed by 36 or more states on Dec. 5, 1933.

PRUSSIA. The Borussi or Prussians appear in history in the 10th century. Bishop Adalbert of Prague was put to death in 997 when he tried to convert them to Christianity. About 1018 Boleslas of Poland compelled some of them to be baptised, and two centuries later the Teutonic Knights completed the Christianizing of the country. The Knights elected Albert of Anspack as their grand-master in 1511. Thereafter, the rise of Prussia to power was rapid, except during the Thirty Years' War, when Prussia was the prey of various armies. Frederick-William, known as the Great Elector (1640-88) left the country in a high state of prosperity, continued by his successors Frederick and Frederick-William I (1713-40), who became the first independent king of Prussia. Frederick II (1740-86) accepted his opportunity to make the kingdom a great power, and his nephew, Frederick-William II (1786-97) profited by the partitions of Poland. Following the revolutions in Europe, and the downfall of Napoleon, Frederick-William III (1797-1840) completely reorganized the state, which continued a more or less absolute government, though some progress was made toward democracy under Frederick-William IV (1840-61). His brother, William I (1861-88), acted as regent during the last three years of his reign, and succeeded, ten years later, as the ruler of the new German empire. Wars with Austria and France, added to the astuteness of his chancellor, Bismarck, did much to enhance the prestige of the new Germany. From then Prussia and the German empire have a common history.

PULASKI, CASIMIR (1748-1779). Polish count and general in the American Revolution, who was born in Podolia, served under his father, and became general of the Polish patriots. He was exiled, came to America about 1772, and volunteered to serve under Washington in 1777. During that year and the next he saw considerable fighting, and at the battle of Brandywine won the title of brigade general from Congress, being placed in charge of cavalry. He defended Charleston, S. C., against the British attacks in May 1779. Later he was wounded at Savannah and died two days later.

PULTOWA. Decisive battle of the world (1709). Sweden was an important member of the German Empire. New Russia was just founded by Peter the Great. Charles XII. dethroned the sovereign of Poland and desired the overthrow of the embryo Russia before it gathered strength. He invaded it with 80,000 picked soldiers; declined overtures of peace, and steadily advanced. The Russians, numbering 100,000, disciplined with constant fighting, were besieged by the Swedes in Pultowa, which commanded the passes to Moscow. The Swedes assaulted; carried several redoubts, but numbers told the usual story; the hitherto invincible Swedes were defeated and the nation crushed. Since then Russia has acquired immense territory, advancing her frontier line nearly 900 miles nearer to Vienna, Berlin, Dresden, Munich, and Paris; 450 miles nearer Constantinople, and within a few miles of the capital of Sweden. Until this time, Sweden had stood in the way of Russian expansion to the westward, but from now on nothing could prevent her from pushing onward in all directions.

PUNIC WARS. Three wars between Rome and Carthage in the 3d and 2nd centuries B. C. Both forces had been summoned in 264 B. C. to aid some refugees held at Syracuse. Carthage arrived first, but Rome insisted on bringing in her army, and a struggle ensued between Syracuse and Carthage and Rome. Little advantage for Rome occurred until 242, when a fleet of 200 ships drove Carthage from the Mediterranean, after which Sicily and other lands were ceded to Rome, with a huge indemnity. The second war (218-201) followed attempts of Carthage under Hamilcar, and then by his son and son-in-law (Hasdrubal and Hannibal) to gain a foothold in Spain. In the conflict Hannibal crossed the Alps and for several years occupied more and more territory near Rome. At the Mataurus, the warriors of Carthage were humbled by the legions of Rome. By 203 B. C. the survivors had left Italy, and by 206 they were all expelled from Spain and Sicily. Rome exacted an enormous tribute, and the younger Scipio fought Carthage again on African soil. In the third Punic War (149-146 B. C.) the proud city in Africa was totally destroyed, and the Romans named the territory the Province of Africa.

PUORTO RICO. Formerly owned by Spain, ceded to the United States after the war in 1898, and now ruled by a governor general appointed by the president and by a native legislative assembly. New spelling of name, by inserting the *u*, was adopted by Congress on May 17, 1932. Columbus discovered and named the island in 1493, and Ponce de Leon began settlement there in 1510. Puorto Rico is the fourth largest of the Greater Antilles group. Gen. Nelson A. Miles took possession for the United States after a short campaign during the Spanish-American War. Congress established civil government in the island in 1900. One delegate is sent to the House of Representatives at Washington. Unlike other territories, Puorto Rico enacts its own tax laws and retains all revenues. On Sept. 13, 1898 a hurricane of unprecedented fury left 400,000 homeless, 200 dead, and property worth $85,000,000 in ruins. The island Legislature in 1934 petitioned for statehood. Much unrest has kept the inhabitants in uncertainty.

PUTNAM, ISRAEL (1718-1790). An American general; born at Danvers, Mass.; took part in the battle of Lake George, and was captain of a company at Crown Point (1755); went on the West India campaign (1762); commanded a regiment during Pontiac's War; was a leader in Stamp Act resistance in Connecticut; raised troops and was a prominent leader at the battle of Bunker Hill (1775); commanded at the battle of Long Island (1776); in charge of defense of Philadelphia; given a command in the highlands of the Hudson.

PYRAMIDS. Huge structures found in several parts of the world, the most famous being in Egypt at Gizeh and in Mexico and Central America. The largest in Egypt are those of Khufu or Cheops, Khafra, and Menkaura. The first of these was originally 481 feet high, 756 feet square, and covered nearly 13 acres. How the immense stones were put into place is a mystery. Herodotus tells us that this pyramid took 100,000 men twenty years to build. The barracks of the workmen of Khafra are still extant and seem capable of housing about 4000. The three great monuments date from about 4500 B. C. Besides the usual subterranean chamber, the pyramid of Khufu has upper rooms, one for the king, one for the queen, the grand gallery leading to these being blocked up with stones. The pyramid of Khafra, for the lowest 16 courses, had a granite case around it. The sarcophagus, unlike the others, was richly decorated, but this was lost at sea on the way to England in 1838. Some other pyramidal structures in Egypt are those at Abusir, some small ones at Thebes; in Ethiopia are some late ones at Gebel Barkal. In Assyria some square pyramids have been discovered, these not rising to an apex, and some of them being recessed. Certain Maya remains in Yucatan resemble pyramid forms with temples at the top. Mexico has other similar structures, and some have been located in South America.

QUEBEC. Visited by Jacques Cartier, who found there in 1535 an Indian settlement called Stadacona. After two frustrated attempts to plant a settlement, Champlain left a few colonists in July 1608. In 1629 it had but few families, who catered to a floating population of monks, traders, and settlers. Sir David Kirke captured the village in that year, but it again fell to France in 1632 by the treaty of St. Germain, and Quebec became the capital of New France in 1663. It was also the capital of Canada in 1763-1841, 1851-55, 1859-65. Frontenac, the French governor, succeeded in beating off an English force from New England sent by Sir William Phipps in 1690. In 1711 another expedition sent against the city was wrecked in the gulf of St. Lawrence. Finally, James Wolfe, a young general 33 years old, in 1759 led an expedition against Quebec, his 8000 men being conveyed there by an English fleet, while General Amherst was supposed to make an attack by land. Wolfe at night surprised and defeated the garrison (Sept. 12) by landing some 1200 from boats up the river while the main fleet deceived the French below by feigning a landing there. Four days later Quebec

surrendered, and so has remained English territory since then, but the French people and language still predominate.

Today Quebec consists of an upper and a lower town, the latter being the ancient settlement. Nothing remains of the old French fortifications, but a citadel and walled enclosure of about 40 acres dating from 1832. Between 1865 and 1871 three forts were built on the river, but they are neither armed nor manned at present. On the Plains of Abraham, where Wolfe fought and died, as did the French general Montcalm, a national park has been constituted, while in the Governor's Garden a monument is erected to both brave generals. Some notable buildings in Quebec are the Notre Dame church in the lower town, built in 1688; the Anglican cathedral, 1804; Laval University, founded in 1663; the hotel, Château Frontenac, erected by Canadian Pacific Railroad; the Ursuline Convent, dating from 1641, with interesting relics, including the skull of Montcalm; and the parliament buildings, built in 1878-1892.

QUEBEC ACT. One of the methods of humiliating the American colonies before the Revolution was the Quebec Act, approved in 1774, by which Great Britain extended the bounds of Canada to include much of what was known as the Northwest Territory. This included the present states between the Ohio and Mississippi Rivers, as well as all of Canada from modern Quebec to the Great Lakes. By this means the French were prevented from joining the colonists against Britain. French civil law was then established, and remains to this day in Quebec proper, and the inhabitants were permitted "the religion of the Church of Rome." English criminal law prevailed, and a governor and council administered the new territory. To this day the French in Canada rely on this Act as a guarantee of their rights.

QUEEN ANNE'S WAR. Shortly after the death of William III in England, war between Great Britain and France broke out again in 1702, and the struggle for possession of colonies in America was renewed. On this continent the struggle came to be known as Queen Anne's War. Acadia was captured by the English, and renamed Nova Scotia. Again New England suffered from Indian raids planned in the north. In retaliation, the British harried the coasts of Acadia in 1704, and three times tried to take Port Royal, finally succeeding in 1710, but the expedition against Quebec was a failure. By the Peace of Utrecht (1713) Great Britain received Newfoundland and Nova Scotia, but fishing rights were retained by the French in Newfoundland waters.

RAILWAYS. Tram cars drawn by men or horses were used for mines as early as the 17th century. In 1764 American Indians drew by cable some cars laden with supplies over the portage at Niagara Falls. Following unsuccessful attempts in England, George Stephenson perfected a railway engine in 1814. On Sept. 27, 1825 the first passengers were carried on the Stockton and Darlington Railway in England. Some earlier lines were not used for passenger service. In 1829 the Carbondale and Honesdale line in Pennsylvania used the *Stourbridge Lion*, a locomotive imported from England. First railways in other countries were in Germany from Nuremberg to Furth, 1835; in Canada, at St. Johns, Quebec, 1837; in India, the East Indian from Calcutta to Delhi, 1854; in Africa in Natal, 1860; in Australasia, near Melbourne, Australia, 1854. In the United States, the Charleston and Hamburg Railway, South Carolina, 1829, was the first road for public transportation by locomotive power. In many places tracks of wood, stone, or iron had been used for drawing cars or trams or ore, stone, wood, and the like. In 1795 an incline plane was used for transporting brick. Lieper in Delaware County, Pa., experimented with track roads in 1809. Other early ones were Fallings Creek, Va., 1810; Bear Creek, Pa., 1818; Nashua, N. H., 1825; Quincy, Mass., 1826. In July 1830 the largest early railway put in operation was from Albany to Schenectady, N. Y., carrying as many as 300 persons a day. Railway mileage in 1840 was 2700; 1850, 8700; 1860, 30,000; 1880, 95,000; 1900, 193,000; 1920, 252,900; 1934, 243,857.

Railway equipment has kept pace with increases in mileage. In engines some of the developments have been the vertical tubular boiler in 1831; four-wheeled swiveling truck, 1832; camel-back engine, 1848; first passenger Mogul, 1875; first of Mallet type of engine, 1904; first three-cylinder compound, about 1925, carrying a boiler pressure of 350 pounds; more efficient fire-box type, 1924; oil-burning locomotives before 1925; and now the diesel engine for the modern stream-lined, aluminum, light-weight, fast trains, efficient and economical, 1934.

Railway coaches in 1840 weighed about three tons and were 15 feet long; today, the all-steel coach is 65 feet long and weighs from 125,000 to 150,000 pounds; the pullman car, about 155,000; the dining car, 180,000. The first coaches accommodated from six to ten persons each; recent ones, about 80. Freight cars weigh from 35,000 to 50,000 pounds, and carry from 30 to 50 tons of cargo. The Mallet type of locomotive weighs over 600,000 pounds, cost $300,000 each, and with a tractile power of 150,000 pounds, can pull a train a mile long. Some inventions of railway equipment were the semaphore signal, 1841; sleeping cars, 1863; use of four axles in cars, 1874; first electric-operated signal, 1871; first automatic train control system, Boston Elevated Railway, 1899. The automatic air-brake was used first in 1869; interlocking block signal, 1906; use of single train dispatcher for a whole district, 1927. Air conditioning of trains, streamlining of locomotives, roller bearings in all cars, lighter but tougher materials for cars, and turbine engines are recent accomplishments in railroading.

RAMILLIES, BATTLE OF. In an important battle of the War of the Spanish Succession, Great Britain and Holland defeated the French at Ramillies on May 23, 1706. Marshal Villeroi, the French commander, allowed his army to be outwitted by the allies in drawing up the lines of battle. The Duke of Marlborough, general of the allies, fought in the ranks with his men, was unhorsed, but directed in person the attack on the French right wing, which was rolled back upon the left by the British cavalry. The French were pursued in a disastrous retreat as far as Louvain, twenty miles away. The French losses were about 15,000; the allied, mainly Dutch, less than one third that number. This battle decided the question as to whether the Bourbons were to rule both Spain and France.

REFORMATION. In 1190 Joachim of Calabria preached the "Eternal Gospel," as his doctrines were termed, and in the next century various new missionary orders in the Roman church were established, the best known of them being that of St. Francis of Assisi. The Great Schism of the church led to claims of rival popes, the seat being at Avignon, France, from 1303 to 1376. Humanistic learning and the revival of interest in pagan culture in general made deep impressions on Italy, Germany, France, and England. Men like Erasmus, Colet, Sir Thomas Moore, d'Etaples, and Reuchlin laid the foundations for Luther and other reformers. Erasmus made a Greek edition of the Bible in 1516, and Reuchlin edited the original Hebrew Scriptures.

In 1517 Luther formulated his *Ninety-Five Theses*, and Germany began to resist the dominance of the Latin races in church government. Within fifty years, Sweden, Denmark, and other lands declared for the new Protestantism; in 1581 the United Provinces turned against both Spain and the Pope. Francis I of France late in his reign, and Henry II following him, suppressed growing tendencies to revolt from the established authorities. The Huguenots were massacred in 1572, but the Edict of Nantes gave religious freedom in France in 1598, which was revoked again in 1685. In 1519 Luther, Zwingli, and others fomented a revolt in Switzerland; in 1531 Geneva also threw off the rule of the dukes of Savoy. Wyclif in England attacked the granting of indulgences and other customs shortly after 1400, and he translated parts of the Bible for the common men to read. In 1532 Henry VIII broke with the Pope because the latter refused to recognize the granting of a divorce to Henry from Catharine of Aragon. Early in the reign of Elizabeth, the break with Rome became more definite, with the forming of the Thirty-Nine Articles of Faith, the constitution of the Church of England, and Pope Pius excommunicated the Queen in 1570. These are some of the events which led to the formation of modern Protestantism in Europe.

REFORM, ELECTORAL. Shortly after 1700 demands for the franchise were made by many in Great Britain who were shut out by antiquated election laws. By 1800 the abuses had greatly increased. Large industrial cities like Manchester and Birmingham were not represented in the House of Commons, whereas Old Sarum, with only seven voters, and Dunwich, half in the water, with but fourteen, each sent two members. In 1793 it was estimated that, in a population of 8,500,000, 11,000 voters sent 257

members to Parliament, while the rest had no votes at all. Some 90 county members were sent by 130,000 voters, while only 84,000 sent 421. Paupers, Nonconformists, Romanists, Jews, Quakers, and agnostics had no voting rights. During four stages of the movement for reform, men like Walpole, Bolingbroke, the Younger Pitt, and Cartright denounced the system by which the "rotten boroughs" could control the Parliament, while thousands had no franchise at all. About 1800, men like Sir Francis Burdett, Bentham, Coke of Holkam, and later Lord Russell, and Gray, leader of the Whigs, demanded rights for the newer cities, the counties, many disfranchised people even of wealth, and countless ones who paid no "rates" or taxes. It remained for a Charing Cross tailor, Francis Place, to arouse the people to action. Following the demands, petitions, bills in Parliament, and much stump speaking, in 1828 Nonconformists were allowed the franchise, in 1829 the Roman Catholics, and in 1832 the system of "rotten boroughs" was greatly amended, and a bloodless social revolution gave the people of England, for the first time, a democratic share in voting for their members of Parliament.

REGICIDES. During the Restoration in England, 29 of those who had condemned and executed King Charles I in 1649, were tried and sentenced to death. Only ten were actually hanged. Men already dead were also condemned, the effect being to confiscate their estates and humiliate their descendants. Cromwell, Ireton, and Bradshaw, three leaders of the Commonwealth against the royalists, were also exhumed, their remains hanged, and then buried at the foot of the scaffold. About 20 of the regicides escaped to other countries, the last survivor being probably Edmund Ludlow, who died in Switzerland, in 1692. Two or possibly three fled to New Haven, Connecticut, where they hid for a time nearby in a cave known to this day as Regicides Cave. Two went under the names of Goffe and Whalley, and streets are named for them in New Haven. Three regicides were captured abroad and executed.

REGULUS, MARCUS ATILIUS (2nd century B. C.). Roman general during the wars with Carthage, one of the commanders in the naval battle at Ecnomus. When the other consul—Regulus was serving his second term—withdrew, he carried on the war against odds, and in 255 B. C. was captured. Tradition says he remained in custody five years, then went to Rome on parole to arrange peace or exchange prisoners. Instead, he urged the Senate to carry on the campaign. According to agreement, he returned to Carthage, and there suffered torture and death. Some later historians find this story doubtful, thinking it was invented or else exaggerated to attest to Roman bravery.

RENAISSANCE. Also written *Renascence,* meaning literally *new birth.* This term is applied to the revival of learning in Europe, dating from Petrarch (1304-74), who perfected the modern Italian language, and from Boccaccio of the same period, who introduced realistic prose tales and made a classical dictionary. Remarkable interest in old literature and art developed. After the fall of Constantinople in 1453, Greek learning diffused through Europe. Events like the invention of printing, making of paper for books by new methods, discoveries in all parts of the world, and the work of scientists like Copernicus and Galileo did much to promote this *Revival of Learning,* another term for the Renaissance. When Rome was sacked in 1527, the center of the new influence transferred to France, Germany, and England. Biblical study and the Reformation ensued in Germany; Wyclif and Chaucer led the making of a new English language. After France invaded Naples in 1495, scholars became interested in studying the art and literature of Mediterranean lands, while Ronsard and his fellows ushered in the age of great classic poetry in French. See also articles on *Humanism* and on *Reformation.*

REVERE, PAUL (1735-1818). Knowing that the British were to march from Charleston to seize the stores of the colonists at Concord, Revere set out on his "midnight ride" of April 18-19, 1775, described rather inaccurately by Longfellow's poem. His horse was taken from him by the British, but he proceeded on foot, and either he or two companions warned the patriots at Lexington and beyond. He went to Philadelphia, and came back with the secret of making powder, for which he set up a mill at Canton, Mass. He later became lieutenant colonel of artillery, and commanded the fort in Boston Harbor, and was a member of the Penobscot expedition. Revere made copper spikes for ships, worked in gold and silver, and did much cartooning and engraving. As grand master of the Masons in Boston, he laid the corner stone of the new State House in 1795.

RHODESIA. District settled in very ancient times by Bushmen of Africa, and before them by a prehistoric race not unlike the Neanderthal primitive man. Before history begins, this was an important gold mining region, possibly later also in Phenician times. Controlled by the Bantu race, it was named Monomotapa in the 16th century. In 1629 the gold rights were conveyed to Portugal. Inspired by a dream of empire by Cecil Rhodes, the British South African Company was organized in 1889. Two years later agreement was made with Portugal as to British interests in Rhodesia,—the name itself dating from 1895. Here Cecil Rhodes built a great empire. The district was transferred to the British government in 1924, is called South Rhodesia, and is now a crown colony with many privileges. North Rhodesia, territory north of the Zambezi, rather sparsely settled and twice as large as Southern Rhodesia, is governed by an appointee of the crown, who delegates authority to various native chiefs. Following agitation for uniting these two districts, a commission from England reported in 1929 that the interests of North Rhodesia are bound to those of the southern district, but union at present could not be accomplished.

RICHMOND. This city, now the capital of Virginia and once of the Confederacy, was founded in 1733 by Col. William Evelyn Byrd, the ancestor of Gov. Harry F. and Admiral Richard E. Byrd. Colonists from Jamestown founded a post there in 1609, but this failed to survive. Richmond replaced Williamsburg as capital in 1779. The town was partly burned by British under Benedict Arnold in 1781, became a city the following year, and was the object of attack by northern armies in the Civil War in 15 battles in the surrounding region and some score of skirmishes. When Petersburg fell on April 2, 1865, Richmond was evacuated by the Confederates, who set fire to the business district, bridges, military stores, and tobacco warehouses. Before the fire could be extinguished by the armies of the North, one-third of the city was burned. The state capital building there was completed in 1792, and was the scene of the trial of Aaron Burr (1807), and of the Secession Convention in 1861. Houdon's famous statue of Washington is there. Other historic buildings are old St. John's Episcopal Church, where Patrick Henry exclaimed at the close of his oration, "Give me liberty or give me death;" the home of Pres. Jefferson Davis of the Confederacy, now a museum; the home of Chief Justice John Marshall; the Poe shrine; and various educational foundations.

RIEL, LOUIS (1844 or 1847-1885). Canadian Indian and Irish half-breed or Metis, but in blood mostly French, who started two insurrections against the dominion authorities. For two years from July 1866 he lived in Minnesota, and, returning to his birthplace at St. Boniface, became leader of those half-breeds who objected to the acquiring by the provincial authorities of the rights of the Hudson Bay Company. He captured the headquarters of Fort Garry (now Winnipeg), became provisional president, and prevented the new governor from taking office. When his forces put to death Thomas Scott, an Orangeman, in 1870, the dominion sent Col. Garnet Wolseley against him, and Riel escaped. He was twice elected to the dominion Parliament, but evidently never served, being outlawed on Feb. 10, 1875. In 1877-78 he was a patient in the Beauport asylum, in 1879 to 1884 lived in Montana, and again led the Metis in their struggle for rights, but on May 15, 1885 surrendered, was tried, and executed at Regina. His fate, which he met with courage, stirred up many demonstrations of sympathy.

RIENZI, COLA DI (about 1313-1354). A popular leader of Rome. He took a stand against the nobles for the murder of his brother. He took the title of consul of orphans, widows, and the poor. In 1347 he drove the aristocratic senators from Rome and took the title of tribune of liberty, peace, and justice. He summoned 200 deputies from the Italian states to take measures for the improvement of the condition of Italy. They met in 1347. He made some impolitic moves and fell from power. Later he was imprisoned. Then he entered a monastery. He made a second attempt to regain his power and was successful. His disposition had changed and after seven months' rule he was murdered in a rebellion of the people in 1354.

RIO DE JANEIRO. Name of a state and city of Brazil, the latter on the Bay of Rio, which extends inland for 17 miles. With mountains extending into the city itself, and with 15 miles of coast line and several boulevards, this city is one of the most beautiful in the world. The site was discovered on Jan. 1, 1502, and so named Rio de Janeiro (River of January). The French, who settled there in 1555, were driven out by Portuguese five years later. The Dutch took possession for a short time in 1640. Rio twenty years later became head of the southern districts, and in 1762 chief city of all Brazil. When the court of Portugal, during disturbances at home, took refuge there in 1808, the city entered upon a period of great prosperity. When the king of Portugal returned home in 1821, his son was left as regent, but in one year, independence was proclaimed with the son as Dom Pedro I, first emperor, and Rio as first capital. Disorders in 1889 led to declaration of Brazil as a republic. In 1891 and 1893-94 other disorders occurred,—in the second instance, six months of intermittent bombardment that took many lives. Notable older buildings are the city palace, Merchants' Exchange, national printing office; newer ones, the Municipal Theatre, 1904, cost nearly $10,000,000, though seating but 1700 persons, and the National Library, founded in 1808.

ROBERTS, SIR FREDERICK SLEIGH (1832-1914). British general, created first Earl Roberts of Kandahar, who was born at Cawnpore in India. He served at Delhi in the Indian War (1857-8), in the relief of Agra and Cawnpore, and in the siege of Lucknow, receiving the Victoria Cross. In Oct. 1879 he defeated the Afghans and took Kabul. In 1880 he made a long march to relieve Kandahar on Aug. 31, after which he held various army posts until the South African War in 1899, when he was put in charge of the forces in the Transvaal. He relieved Kimberley, defeated the Boers under Cronje, took Bloemfontein, and later Pretoria, after which the Orange Free State and the Transvaal became part of the domains of the British in South Africa. Roberts advocated the creation of a citizen army in Great Britain, founded the Society of Pilgrims, and during the World War served on a mission in France, where he died. To all his soldiers he was affectionately known as "Bobs."

ROCHAMBEAU (*ro-shom-bo'*), **JEAN BAPTISTE** (1725-1807). French count, patriot, and general, who was born in the Vendôme, entered the army in 1742, and won fame at Minorca (1756). With a French army, he was sent to assist the American colonies and served in the final campaign at Yorktown, Va. Congress formally expressed thanks to Rochambeau. In 1902 at Washington Pres. Theodore Roosevelt unveiled a statue of him, the gift of the French nation. Rochambeau returned to France in 1783, became governor of Artois and Picardy, and for a time commanded the Northern Army in the Revolution. In 1792 he retired because of the excesses of the mob. Imprisoned during the Reign of Terror, he escaped by the fall of Robespierre in 1794. Napoleon restored him to his estates and honors.

ROMANOFFS. Name of the rulers of Russia from 1613 to 1917. The first was Michael Romanoff, whose father was ineligible, having become a monk, though in 1616 he was elected patriarch of the church, and signed all state documents from then until 1633. Romanoff history falls into three main periods: first, to 1698 when Peter the Great, after a tour abroad, instituted many reforms; second, to 1810 and the death of Paul I, following great development in St. Petersburg; to 1917 and the end of the dynasty with the death of Nicholas II and his family. From early times the clergy and nobles exercised great influence in Russia. During 30 of the first 70 years of Romanoff rule, wars were waged against Sweden and Poland. Beginning with Catherine the Great, 1762, most of the later rulers tried to help their subjects, but conditions and forces at court prevented any particular progress toward democracy. Peter and Catharine extended the borders of the empire; Peter II, III, and Paul, with others, left little impress on the nation. Despite great economic prosperity, Russia still clung to autocratic methods until, in 1861, Alexander II abolished serfdom; Nicholas II, after the disastrous war with Japan, promised reforms and established the Duma, but still the masses did not share in the government. On March 15, 1917 Nicholas II abdicated, and his family was killed on July 16, 1918 at Ekaterinburg in the Ural region.

ROME. Alban shepherds occupied the district known later as Rome in the Bronze Age before the dawn of history. Romulus, the mythical founder, was said to have come to Rome in 753 B. C. In historical ages Rome was a republic for 50 years, with little expansion, and then for 70 years extended along the Mediterranean and conquered the neighboring tribes. Further expansions occurred in the war against Tarentum, 280 B. C.; in the final destruction of Carthage, 146; and later extensions of the empire into Asia and Africa. Internal conflicts, however, followed, some of which were the Social War, dating from 90 B. C., when the subject tribes claimed voting rights and sought to organize an Italian state of their own; the following Civil War between Marius and Sulla, ending only when the former died, and Sulla ravaged Italy and slew many at home, after which he retired from his dictatorship.

Sulla restored the constitution and tried to make the senate supreme, but a wave of democracy followed, led by Caesar and by Cicero, the latter leader of the moderate party. Pompey and Crassus (richest man in Rome) now formed an alliance, the one putting down a revolt in Spain, and Crassus subduing the revolt of Spartacus and other slaves. Pompey defeated Mithridates in the east, freed the seas from pirates, and set up an eastern empire in Asia, at the same time subduing a tumult among the Jews. Catiline's conspiracy was suppressed, and Caesar, Crassus, and Pompey formed the first triumvirate to rule Rome. The empire was extended to the Euphrates, Spain was subjected once more, and Caesar conquered Africa, Gaul, and other outlying districts, until on March 15, 44 B. C. he was killed by conspirators. Mark Antony, Lepidus, and Octavian formed the second triumvirate, and a general slaughter followed, including 300 senators and Cicero. Antony was awarded the East, Octavian, Italy, and Lepidus, Africa. Lepidus was soon eliminated, and Octavian declared war on Antony and Cleopatra, with whom Antony was enamored, and in the battle of Actium in 31, Octavian gained complete control of the Roman empire.

He assumed the title of Augustus, allowed himself to be worshiped as a god, and began an era of fifty years of peace, ending in personal misfortune and gloom. In 14 A. D. Tiberius followed him, and then a long succession of emperors, a few good, many incompetent, some mere beasts. Some of the worst were Nero, Caligula, Domitian, and Commodus, son of Marcus Aurelius. The noblest later Roman emperors were Vespasian, Trajan, Marcus Aurelius, Caracalla, and finally, in 323, Constantine the Great, who removed the capital to Byzantium (later called Constantinople). He kept the barbarians in check, but they burst over the barriers in 378, when the Goths defeated the emperor Valens, and at last when Alaric sacked Rome, Attila led the Huns into western Europe, and Odoacer began to rule in 476.

ROTTEN BOROUGHS. See *Reform, Election.*

RUMANIA. Dacia became a Roman province in 106 and prospered long after the conquerors left in 274. Between 500 and 1200 various bands of Goths, Tartars, Huns, Bulgarians, and Magyars overran the country. About 1300 Walachia and Moldavia took on separate characteristics. The former at some brief periods, as from 1330 to 1344 and from 1593 to 1601, was independent, and at other times under either Hungarian or Turkish rule until 1861. Native princes ruled in Moldavia under the authority of Poland or Russia, but Stephen the Great (1458-1504), national hero, defeated the Poles, Hungarians, and Walachians in battles. Turkey granted these provinces certain privileges in 1821, but Russia prevented any real development, until after the Treaty of Paris in 1856 and that of Berlin in 1878. Walachia and Moldavia held separate assemblies in 1858, but had a common group to reconcile rights and justice between them.

The assemblies elected as ruler Prince Alexander John Cuza in 1859, who became king in 1861, but was deposed five years later, and was followed by Prince Charles (Carol) of a minor Hohenzollern house. In 1869 Charles married Elizabeth of Nieuwied, long known to us as the author of stories under the name of Carmen Sylva. Ferdinand I succeeded Charles in 1914, dying in 1927, after which his grandson, the boy Michael, ruled under a regency for three years. In 1930 his father, Carol, who had renounced his royal claims in 1925, returned from Paris and was proclaimed king. Rumania, after much hesitation, joined the allies in the World War, was overrun by enemies, lost 800,000 men, and made

peace in May 1918. By post-war treaties she doubled her territory, mainly by additions of Transylvania, most of Bukowina, and part of the Banat of Temesvar.

RUSSIA. Historians date Russia from the brothers, Rurik, Sineus, and Truvor, called in from Scandinavia in 862, to help the natives against the Finns and Lithuanians. Vladimir (980-1015) extended the boundaries, embraced the Greek Church, built Kiev and other towns, and favored education. The Mongols swept over the land from Asia in 1224, but withdrew for 13 years, and in 1239-40 ravaged much of Russia and entered both Poland and Hungary, being checked in Moravia. With the decline of Mongol power in the west, and the defeat of the Tatars after they had taken Moscow in 1381, their invasions ended, and Ivan III (1462-1505) assumed the title of "Ruler of all Russia." The land was completely freed in 1480. Ivan III, his son Basil, and his grandson, Ivan the Terrible, ruled for 122 years. Feodor (1584-98), the next in line, last of the house of Rurik, died childless, and a period of misrule and uncertainty followed, ending with the choosing of Michael of the house of Romanoff, who ruled from 1613 to 1645. (*See Romanoffs.*) Michael put down the Don Cossacks, made peace with Poland and with Gustavus Adolphus of Sweden. Michael's son, Alexei, allowed reform under the patriarch in the church, checked the ambitions of Turkey in Little Russia, and then followed years of prosperity until after the Napoleonic wars. Russia became the center of learning, literature, and power in eastern Europe. Alexander II (1855-81) at first instituted several reforms, including freedom to 20,000,000 serfs, snuffed out the claims of Poland to independence (1868), sold Alaska to the United States, acquired power in Turkestan, won a war against Turkey (1878), and from then dominated in southeastern Europe. Nihilism sprang up in demands for more liberties, officials were murdered, repression succeeded, and Alexander was killed by revolutionists in 1881. His son of the same name was more reactionary still, and when Nicholas II came to the throne in 1894, Russia was almost an absolute autocracy. The history from then on till 1917 is a succession of plots, repressions, court favorites, the disastrous war with Japan (1904-05), and growth of Socialism, terminating in the Bolshevik revolution in 1918.

Russia mobilized 13 corps on the Austrian border on July 25, 1914, refused to answer the demands of Germany for their withdrawal, and so precipitated declarations of war by Germany on Aug. 1 and Austria on Aug. 6. The armies of Grand Duke Nicholas invaded East Prussia and Galicia, won notable victories, but were forced back. The Bolshevik gaining control signed away rights to Finland, Estonia, Livonia, Poland, Courland, Ukrania, Bessarabia, and part of Transylvania at the peace of Brest-Litovsk, March 3, 1918. Russia had suffered terrible losses, was goaded by internal disorders, inefficiency of the ruling class, and the rise of the Socialists. Various later attempts to maintain the Romanoff dynasty ended in abdication of Nicholas on March 15, 1917 and his assassination July 16, 1918, the brief Kerensky regime, and the attempts of older groups to keep the people back. See *Soviet Union,* also *Rulers and Statesmen.*

SAAR BASIN. Small area north of Lorraine, 738 square miles, with 770,000 inhabitants, noted for its coal fields. Before the World War the Saar was a part of Germany, but Article 45 of the Versailles Treaty gave it to France for exploitation for 15 years, ending in 1935, when a plebiscite was to determine whether it should continue to be administered by a committee of the League of Nations, revert to Germany, or become part of France. On Jan. 15, 1935, the people of the district voted to ally with Germany once more, and the formal transfer was made peacefully in March. Germany agreed to pay France an indemnity of 900,000,000 francs and 11,000,000 tons of coal to compensate for destruction of French coal mines during the World War, this in addition to the proceeds during French exploitation. In 1933 the output of coal was about 10,500,000 metric tons.

ST. BARTHOLOMEW, MASSACRE OF. Catherine de' Medici, fearful of the growing influence of the Protestants of France, attempted to have Admiral Coligny assassinated. Failing in this, she persuaded the king that safety required the extermination of the Huguenots. Some credit for this must be given to the political feud between the House of Guise and the House of Condé, two powerful noble families. Catherine had the support in her plan of Henry of Guise, the Dukes of Anjou and Nevers, and other catholic leaders. The general massacre began in Paris at daybreak on Sunday, Aug. 24, 1572, St. Bartholomew's Day, and continued unrestrained until Sept. 17, and in some of the provincial districts to Oct. 3. Some of the provincial authorities refused to countenance the atrocities, among them being those of Picardy, Dijon, and Normandy. Estimates of those killed run from a few thousand to fifty by the historian Hotman.

ST. CLAIR, ARTHUR (1734-1818). American general, of Scotch birth, who served in the British army at Louisburg and Quebec in the Canadian campaigns against the French, and then (1764) settled in Pennsylvania. He joined the Americans as a colonel (1775), was in charge at Ticonderoga (1777), and became ranking general of the army in 1791, having been appointed governor of the Northwest Territory in 1789. He commanded a force against the Miami Indians in 1791, and 630 were killed and 280 wounded of the original 1400, but General St. Clair was exonerated from blame as commander. He resigned his command, however, in 1792 and his governorship in 1802. As president of the Continental Congress in 1777, St. Clair had much to do with guiding the early destinies of the American nation.

ST. LOUIS. This chief city of the middle Mississippi Valley was settled in 1764 as the headquarters of New Orleans merchants in trading with the Indians. Pierre Leclede chose the site, Auguste Choteau built the first houses, and the place was known for years as Leclede's village or as Plainville. The French continued to protect the inhabitants for six years after the territory was ceded to Spain in 1762. When the United States acquired the Louisiana Territory in 1803, St. Louis had but 180 houses; when the state was admitted to the union in 1821, it had 5600 inhabitants, in the main of French extraction, but with liberal sprinklings of men from Kentucky, Virginia, and New England. Later the Irish and Germans began to come in numbers. Four fur trading companies operated by 1822, and St. Louis became the eastern terminus of trade, commerce, and exploration. From here the various expeditions set out for the great northwest, the packtrains were organized for the mountains and the plains, and the first railways made a start after 1850. Abolition sentiment always had been strong, there being only 1200 slaves in St. Louis in 1860, most of them serving as domestics. During the war, the city was a stronghold for the North, and the center of relief and of refugees, some 40,000 of whom were cared for in St. Louis. From 1860 to 1890 St. Louis became the center of a remarkable interest in German philosophy. After 1870 the development has been mainly literary, commercial, and artistic. In 1904 the Louisiana Purchase Exposition was viewed by over 19,000,000 persons. See Principal Cities.

ST. MIHIEL. On Sept. 25, 1914 the Germans captured St. Mihiel, 20 miles from Verdun, department of the Meuse in France. They strongly fortified a salient there, and little was done to dislodge them until Sept. 12, 1918, when General Pershing's American forces, assisted by the French, took the position, with a loss of about 7000. Some 14,000 German prisoners and 400 guns were captured. This was the first independent action by United States troops. The salient was 30 miles wide at the base, 25 on the south side, and 14 on the north, the town of St. Mihiel being at the apex. Liggett's 1st corps and Dickman's 4th operated on the south, having Blondet's 2nd French Colonial Corps on their left, with the 35th and 91st Americans in reserve, and the 80th and 33d as general reserve. After a preliminary bombardment of four hours on a 12-mile front, the advance was made, and in 27 hours each flank met at Vigneulles, completing the straightening of the sector.

ST. PAUL. About 1800 an Indian village sprang up where St. Paul now stands, the region being called in Indian, *Innijiska* or White Rock. Father Louis Hennepin visited the site in 1680, La Salle in 1682, and in 1766 Jonathan Carver of Connecticut and his heirs claimed the Indians gave him a grant of the land there. President Jefferson sent Zebulon M. Pike to take possession in 1805, giving the Indians 60 gallons of whiskey and some trinkets; later Congress added $2000 in money. The first steamboat touched there in 1823, and in 1840 the town had

200 settlers. Father Lucien Gaultier in 1841 dedicated a log chapel there to St. Paul; hence the later name of the settlement. When the territory was organized in 1849, the small village was designated and remained the capital of Minnesota. The city is now governed by a commission of six, has extensive flour mills, and with Minneapolis is the distributing center of the region.

SALIC LAW. This term is variously applied to a collection of penal codes that came down from the Salian Franks, sometimes called Salians, one of the numerous early Germanic tribes. Many forms and manuscripts exist, even the earliest, which has 65 chapters, being a revision of originals now lost. Charlemagne had a fourth version made in 70 chapters, with stress on some old provisions and some new ones added. Some versions show influences of early Christianity. Some glosses, like the Malberg, are no longer intelligible because of the language in which they are written. Numerous literary works, like Shakespeare's *Henry V*, intimate that the Salic law forbad women to rule among the Franks. The Salian laws that we now have made no such statements, but they do state that daughters cannot inherit land. Since the inheritance of land was usually connected with ruling, it was later said that the Salic Laws forbad female monarchs. The subject was discussed in regard to daughters of Louis X and Philip V. It was proposed by some to exclude Marie Theresa from the throne of Austria because of these ancient Salic provisions. Likewise Philip VI and Edward III of England disputed as to the application of Salic Law, as then supposed, regarding the Spanish and English claims to what is now France.

SALVADOR, EL. The smallest, most thickly populated, republic of Central America, with the best harbor, undeveloped resources save gold and silver, and coffee the chief product. From the Spanish conquest in 1525, until the liberation of Mexico and Central America in 1821, El Salvador was part of the large district known as Guatemala. For some years, until 1839, the country belonged to the Central American Federation. Since then El Salvador has had a number of changes in government characteristic of American Latin republics. The district is much subject to earthquakes, severe damage being done in the capital city, San Salvador, in 1917, and 1919. On Dec. 4, 1931, Gen. Martinez, then vice president, drove out his elected superior, Araujo. The United States and other governments refused to recognize him, and El Salvador denounced the Treaty of 1923, which provided for such contingencies, and Costa Rica, Nicaragua, Honduras, and Guatemala followed suit in 1934.

SAMARIA. Ancient capital of Israel, chief city of the Palestine area, but now only an inferior village called Sebastiyeh. From the time of the founder, Omri, king of Israel, the Biblical history is recorded in I *Kings* xvi and xx and II *Kings* vi, vii. Assyria humbled Samaria in 722 B. C., Alexander the Great subdued the inhabitants in 331 B. C., but Herod restored it to grandeur. Samaria has interesting remains, such as a temple, hippodrome, a church built by Crusaders, and the reputed tombs of Elisha, Obadiah, and John the Baptist. In 1908-10 the Harvard University explorations unearthed Omri's palace, and a number of Hebrew texts from the 9th century B. C. In 1931 various remains of Roman times were traced, including a forum, stadium, senate house, and a palace.

SAMNITE WARS. Three series of conflicts, from 325 to 290 B. C., between Rome and the Italian tribes near her known as the Samnites. Rome lost heavily, including the disastrous defeat at Caudine Forks in the second conflict. Once the Romans were forced "under the yoke," a symbol of submission, most galling to their pride. They colonized neighboring districts, and finally crushed the allies in the battle of Sentinum in 295 B. C. The Samnites were at times assisted by Gauls and Etruscans. From this time, for two hundred years, Rome ruled supreme in the central and southern districts of Italy.

SAMOA. Fourteen islands about 2000 miles south of Hawaii in the Pacific. Since 1900 all islands east of 171° west longitude have belonged to the United States, the rest to Germany, until taken by new Zealand in 1914, and now administered by that nation under mandate of the League of Nations. Tutuila, Tau, and the Manua group, with a total area of 60 sq. miles, belong to the United States, and Pago Pago harbor is the best in the south Pacific. Bougainville visited the islands in 1768, and in honor of native boatmen Samoa was called the Navigator Islands. Christianity was introduced in 1830. Because of disturbances that developed over succession to the throne, from 1868 to 1899, Great Britain, Germany, and the United States took a hand in the government, and in 1899 agreement was made to cede the islands to Germany and the United States. The United States has a powerful radio station at Tutuila, the governor of which administers the affairs of American Samoa, but each of three districts is managed by a native under his direction. Samoa is celebrated as the last home of British author, Robert Louis Stevenson, 1889 to his death in 1894.

SAN FRANCISCO. With Seattle and Los Angeles, San Francisco shares the honors of the Pacific Coast for size and industry. In 1769 the name San Francisco de Assisi was given to the bay there, including the beautiful Golden Gate, the pride of the central pacific ports. Here the monks, Palou and Cambon, set up a mission in 1776; a village called Dolores flourished about the station in 1834; and a trading village sprang up at Yerba Buena, three miles north, in 1836. When the United States took possession in 1846, only 450 people lived at the point, the name being changed to the present one. Within a year after the discovery of gold in 1848, the city had 10,000 inhabitants. Great fires swept away most of the wooden structures in the first three years. The great earthquake and fire of 1906 laid one-third of San Francisco in ruins, including most of the business district, with a loss of over $200,000,000, 452 deaths, and 250,000 persons homeless. The Panama-Pacific Exposition in 1915 revealed the history and wealth of the American nations. San Francisco has many beautiful parks, fine public buildings, and an interesting foreign quarter known as Chinatown. The new bridge from the city across Yerba Buena Island to Oakland is the largest of its type yet attempted, the cost being about $80,000,000.

SAN MARINO. Smallest republic in the world, 32 square miles, about 14 miles from Rimini, Italy, and known for its crags, narrow and steep streets, three citadels, and independence from early times. Protected by Italy, customs and social life follow the Italian. Named for the abbot San Marino, who lived about 885. San Marino kept out of the factions and wars of the Middle Ages, save that it sided with the Ghibellines, and was briefly punished by the Pope, 1247-49. It resisted designs of Caesar Borgia in 1503, Cardinal Alberoni in 1739, and of others, such as Maletesta in earlier times. Napoleon left San Marino alone. In 1906, 1920, and 1921 changes were made in election laws, making the republic more democratic. Presidents are elected for six months only. Stone, wine, and postage stamps, the latter changed frequently, are chief exports. San Marino has always refused to set up a gaming table like those of Monte Carlo.

SAN MARTIN, JOSE DE (1778-1850). More credit is due to him than to any other for the freeing of the Argentine, Chile, and Peru from Spanish domination. He was born in Uruguay, educated in military tactics at Madrid, enlisted to help Argentina in 1812, commanded an army against the Spanish in upper Peru in 1814, but withdrew to help Chile. In this he was assisted by Argentines, and by Bernardo O'Higgins, son of the governor of Chile, whom he left in charge of the south portion while San Martin himself turned to conquer the north (1818) and Peru (1821). Difficulties arose from internal discords, threats of royalists, and followers of General Bolivar, and so San Martin resigned his protectorate over Peru, and later lived in Europe in poverty till his death. His companion, O'Higgins, likewise withdrew when the independence of Chile was assured.

SANTIAGO. During the war between the United States and Spain, Santiago in Cuba, second largest city of the island, was subject to attacks by Americans on July 1-3, 1898. The Spanish fleet, commanded by Admiral Cervera, took refuge in the harbor, where it was blockaded by Admiral W. T. Sampson, while General W. R. Shafter invested the city by land. Santiago de Cuba was taken after decisive charges at El Caney and San Juan Hill by the forces of General H. W. Lawton, assisted by the Rough Riders under Cols. Leonard Wood and Theodore Roosevelt. On July 3, when the Spanish fleet attempted to steam out of the harbor, the American battleships, commanded by Sampson, with Admiral W. S. Schley second in command, engaged the fleet and destroyed or beached them all. Following the defeat of the Spanish at Manila on May 1, by

Admiral George Dewey, and the successful campaign of General N. A. Miles in Puerto Rico, Spain was willing to accept terms of peace, according to which (by the treaty at Paris, Dec. 10, 1898) the Philippines, Guam, Puerto Rico, and all other Spanish West Indian claims were ceded to the United States on payment of $20,000,000.

SARACENS. This name, loosely employed, designated the Mohammedans of Syria and Palestine in the time of the Crusades, or the Arabs generally, or the northern tribes of Africa that conquered parts of Europe. Within a hundred years of the flight or Hegira of Mohammed, (622), the Saracens founded a great empire. The first successors of Mohammed, the califs, Abu-Bekr and Omar, dominated in Syria, Persia, Egypt, and adjacent lands. The Saracens began to cross into Spain before 709, then into Gaul, where they were checked by Charles Martel in 732. By 878 they had mastered Sicily, and later obtained a foothold in Burgundy. The beginning of the decline of the Saracenic power dates from the separation of the western part of the empire, with the capital at Cordova, Spain.

SARATOGA, BATTLES OF. Two engagements that turned the tide of the Revolution in favor of the colonists. Suffering from undue confidence, the British felt that their initial success would soon decide the war in their favor. On Sept. 19, 1777, 4000 British engaged 3000 colonials at Freeman's Farm. Little advantage was gained by either side. On Oct. 7 Gen. Burgoyne attacked the Americans positions on Bemis Heights, but was forced to withdraw. The British next entrenched at Saratoga, but were surrounded by the Americans and compelled to surrender to Gen. Gates. At Bemis Heights the American commanders were Gens. Poore, Morgan, and Benedict Arnold.

SARDINIA. Next to Sicily, the largest island in the Mediterranean, settled by men of Carthage, but taken by Rome in 238 B. C. After the break-up of the Roman empire, Sardinia was overrun by Vandals, Goths, and Saracens, until the 11th century when Pisa and Genoa sought to dislodge the invaders. Acting on the authority of the Pope, the king of Aragon ruled Sardinia until 1713, after which Austria controlled for a few years until the island was traded with the House of Savoy for Sicily. Charles Emmanuel III (1730-73) brought prosperity during his long reign. Feudalism was abolished in 1836, Sardinia and Piedmont were united in 1848, and Victor Emmanuel I, King of Sardinia, became ruler of united Italy in 1861.

SAVANNAH. This city of Georgia, first settlement in the state, was founded by James E. Oglethorpe in 1733. John Wesley and his brother, Charles, came in 1733, followed by George Whitefield, another celebrated English preacher. Whitefield founded the Bethesda orphanage, ten miles south of Savannah, the oldest foundation of this kind in America. He also founded Christ Church, of which John Wesley was the third rector, and here he founded the first Sunday School in America. Savannah has been the scene of many notable gatherings: the first legislature of Georgia, 1755; first Provincial Congress, 1775; convention that framed the first state constitution, 1776-77; the secession convention of the state in 1861. It was the capital until 1778, chartered as a city in 1789, and the objective of Sherman's march to the sea in 1864. Among the many historic buildings in Savannah are the Hermitage manor and plantation outbuildings; Wormsloe, still occupied by descendants of Capt. Noble Jones, who obtained the land by patent signed by George II; Mulberry Grove, the estate given by Congress to Gen. Nathaniel Greene, where Eli Whitney invented the cotton gin while a guest there in 1793.

SAXONY. This name is variously applied to three regions of the old German empire. They are the present republic of Saxony, the old Grand Duchy of that name (now part of Thuringia), and a province in Prussia. Saxony was governed by dukes from early times to 1356, when Rudolph II was made elector. The house of Wettin, in two branches, ruled until 1806, when Saxony became a kingdom. Saxony took no part at first in the Thirty Years' War, but the elector turned Protestant in 1631. Frederick the Great invaded Saxony and drove the elector, Frederick Augustus II into Poland, where he was elected the king. Frederick Augustus III finally sided with Napoleon in 1806. In the war between Germany and Austria, Saxony helped the latter, but joined the North German Confederation in 1870. In the war with France, Saxony helped Prussia. Following the abdication of the king, a republic was proclaimed on Nov. 9, 1918.

SCAN'DERBEG, PRINCE, or BEY ALEXANDER (1403-1468). A famous patriot chief of Albania. His real name was George Castriota; delivered as a hostage to Amurath II. (1413), and was brought up in Islamism; became master of the town of Croia (1443); vanquished the Turks and banished them from Epirus, accomplishing this task in twenty-two pitched battles; at his death the people, lacking a mainstay, allowed the Turks to gain control of the country.

SCHLESWIG-HOLSTEIN. For a long time Schleswig was regarded as predominantly Danish, and Holstein as German in people and customs. From 1460 until 1848, the former was a duchy of Denmark, but never closely united with that country. When Frederick VII in 1848 proposed to incorporate Schleswig in the Danish kingdom, there was a revolt, and Prussian troops drove out the Danish army. In 1864 the Danes were compelled by Prussia to make humiliating terms of peace. Schleswig was to go to Germany, Holstein to Austria, but, after some disagreements, the Seven Weeks' War followed, and then both districts were taken by Germany. So conditions remained until after the World War. The Versailles Treaty provided for a plebiscite in Schleswig. The northern part voted strongly to join with Denmark, and the southern, to unite with Germany. In 1920 the old Schleswig area became the South Jutland Province of Denmark.

SCHLEY, WINFIELD SCOTT (1839-1911). An American naval officer, who was graduated from Annapolis in 1860, fought in the Civil War, held a number of posts, and in 1884 was sent on a third expedition to find Lieut. A. W. Greely and men marooned in the Arctic. He located them near Cape Sable. After being given the rank of commodore, he was sent in 1898 to Cuban waters with a fleet headed by his flagship, the *Brooklyn*. Later W. T. Sampson, acting as rear admiral, was given chief command of the fleet then off Santiago de Cuba. While Sampson was absent, the Spanish ships attempted to emerge from the harbor, where they had been blockaded. As next in command, Schley conducted the battle, in which the Spanish were totally defeated. Schley was advanced six points in rank, and in 1899 was made a rear admiral. Meanwhile, the department proposed to raise Sampson to a higher grade, and a bitter controversy resulted. Schley retired in 1901, and asked for a court of inquiry, which censured him for delay and carelessness in maneuvering during the battle.

SCOTLAND. Caledonia or Scotland for centuries was inhabited mainly by Picts, who spoke Celtic, and also by Britons in the southeast. Just before 500, the Scots came up from Ireland, and by 800 the Saxons and Scandinavians had obtained a foothold. In 844 Kenneth Macalpin became king of the Scots and Picts, and then followed struggles with the invading Northmen. Duncan became ruler of the land, but in 1040 was slain by his own general, Macbeth, who had some valid claims to the throne, but who apparently was in league with the Norwegians. Malcolm slew Macbeth in 1057, married Margaret of England, and brought about several civil and ecclesiastical reforms. Malcolm and his eldest son were killed in a raid on northern England, but Alexander, Edgar, and David, three sons of this couple, ruled in turn. David (1124-53) married an English lady, after spending some time at the court, gained some new territory, invaded Northumbria, and later aided Henry II in his first attempt to gain the English throne. David's grandson and heir, Malcolm IV (1153-65) lost these gains; William the Lion, his brother, lost more ground and did homage to England.

Then followed a century of peace and prosperity, broken after the death of Alexander III in 1286 by the feud over the rival claims of John Baliol and Robert Bruce to the throne. Edward of England interfered, claiming feudal rights, and decided in favor of Baliol. This stirred up war, in which William Wallace beat the invading army at Stirling in 1297, but the English won at Falkirk. Robert Bruce threw off the English yoke at Bannockburn in 1314, Wallace having been executed in 1305. In the next 200 years, Scotland suffered from uncertainty, regencies during the minority of several children, struggles with English kings, and intrigues with

France. Finally, James IV married Margaret of England in 1503 and so cleared the way for the union of the two crowns under James VI (James I of England) his great-grandson in 1603. During the preceding reign of Elizabeth, the claims of Mary of Scotland, caused no end of anxiety on both sides of the Tweed. James VI of Scotland, Mary's son, took hold of government in England with a firm hand, but Charles I alienated the Scotch in religious matters, finding much opposition by the Covenanters. Finally, in 1707 the Act of Union settled once for all whether England and Scotland would have one monarch or two. Only the Jacobite rebellion in 1745, troubles over distribution of Scotch lands, and religious discords threatened to break this union.

SCOTT, WINFIELD (1786-1866). An American general; born near Petersburg, Va.; appointed captain of light artillery (1808); served in the War of 1812; fought at the battle of Chippewa, and Lundy's Lane, where he was twice wounded; prepared a manual of military tactics, which was the first to be issued in the U. S.; appointed commander-in-chief of the army (1841); served in the Mexican War (1847), winning the battles of Cerro Gordo, Contreras, and Churubusco, together with the decisive battles of Molino del Rey and Chapultepec; nominated as Whig candidate for the presidency, but was unsuccessful. Office of lieutenant general was conferred by brevet on General Scott.

SEA POWER. War vessels date from earliest times, for the people of Carthage, Persia, and Phenicia had navies. So did the Greeks as early as the 7th century B. C., when the Corinthians fought their colony of Corcyra in 664. The Peloponnesian War also caused Athens to proceed against Sicily with a fleet of 122 ships; and the Persians used a navy in their attacks on Greece in 490. Early ships rammed each other with pointed prows, later they threw missiles from deck to deck, and finally they fought alongside each other. The Moors used swift-sailing galleys, both single and in squadrons, and the Norsemen were the despair of many coasts from the western shores of the Atlantic to the Black Sea.

England became a great naval power with the destruction of the Armada in 1588. Spain, Portugal, Holland, and Britain long vied for command of distant shores through powerful seamanship. The defeat of the Dutch off Zuyder Zee in 1797 gave Britain considerable advantage on the ocean. Indeed, merchants all over the trading world from 1300 on spoke of England as "mistress of the seas," but this term meant ability to keep the waters free from pirates. For a long time before 1800, salutes were fired by ships of other nations when they approached or passed English vessels, a custom abandoned after 1805, but still existing in another form,—the dipping of the flag when boats meet. In 1354 Peter of Aragon encased some of his ships in leather, and in 1530 the Spanish *Santa-Anna* was covered with lead. Robert Fulton, 1814, made a steam warship. After shells were first used in 1854, all the nations turned to devising heavy armor, such as the iron-clad of the French in 1859, and Ericsson's *Monitor* in 1861 in the Civil War. Since then there has been a constant race to devise armor capable of resisting the increasingly effective modern shells, mines, and torpedoes.

SEBASTOPOL (October, 1854-September 11, 1855). During the Crimean War, Sebastopol, a Russian port on the Black Sea, was the scene of a long siege by the allied forces. The city was surrounded by new fortresses and the harbor closed by sunken ships of war. Attacks upon the city were made repeatedly, and finally, in 1855, after a three weeks' bombardment, the Russians evacuated the city, which was then occupied by the allies. On May 1, 1918 the Germans took Sebastopol and established a dictatorship over the Ukraine. Here on Nov. 26 the allied squadron took charge of the German submarines, in accordance with provisions of the Armistice.

SECESSION. Various states at times have claimed the inherent right to withdraw from voluntary unions. In the Philadelphia Convention, 1787, Elbridge Gerry exclaimed that "a secession would take place" unless a compromise was made among the delegates. Talk of the right to withdraw from the United States was heard after 1790, and particularly in 1803 when Louisiana was purchased of France. Again, when the state of Louisiana was proposed for admission in 1811, the talk flared up once more. In 1814 delegates from New England met at Hartford, Conn., to consider grievances growing out of the War of 1812. Certain resolutions were passed, and proposals made for securing states their rights, but whether open secession was advocated seems in dispute. South Carolina in 1832 had a Union Party, which advocated secession, instead of nullification, and in 1847 John C. Calhoun thought of getting the slave states to agree on some united action. From then on, those in the South argued that states could withdraw, since the Constitution did not forbid this, and since states had certain rights reserved to them. During the agitation over the Kansas-Nebraska Bill, the same threats were heard. Secession was finally proposed by state conventions in 1861, this action being one immediate cause of the Civil War.

SEDAN. Town in northern France where a decisive battle was fought in the Franco-Prussian War of 1870. On July 15 the French emperor, Napoleon III, had rashly declared war on the Germans. The armies of France proved unprepared, and by the end of August were hard pressed. They took refuge at Sedan on Aug. 31, rested that day, and prepared for the German attack on the morrow. General MacMahon was in charge, but was wounded, and in the confusion of old and new orders from rival commanders, the French lost the advantage. By a series of movements about the town, Moltke for the Germans forced the concentration of the French within a circle of 16 miles. Finding themselves hemmed in on all sides, the French pushed the Bavarians out of two villages, but the Prussian corps stood ready to fill in any resulting gaps. Wimpffen, for the French, at last signed an unconditional surrender, provided that the officers could retain their swords. In all the French loss was 17,000; the German, 9000. The French surrendered 82,000 captives, 558 guns, and tremendous stores of supplies. This battle really decided the war, the downfall of Napoleon III, and the rise of the French republic.

SEPOY MUTINY. In May 1857 the sepoys or native soldiers in India rebelled at Delhi because some of their number had been imprisoned because they refused to use greased cartridges. Their religion forbad them to touch or taste grease. Delhi was taken, many people were massacred, and Nana Sahib forced General Wheeler in June to surrender Cawnpore. Safe conduct to Allahabad was guaranteed, but all the men were at once slaughtered, and the women and children likewise when relief was brought from Allahabad by General Havelock. Lucknow almost a month later was saved, so was Delhi in September, and by June of the following year the rebellion was checked, but British losses in these operations were heavy.

SEVEN WEEKS' WAR. Chancellor Bismarck of Prussia planned the union of the German states, with Prussia dominant. According to the scheme, Austria was to be forced out of the Confederation. These attempts brought on a brief war in 1866, when Prussia swept into Bohemia, and defeated Austria on July 3 at Sadowa. The Italian allies of Prussia, however, suffered defeats on land and sea. The eight south German states, which had assisted Austria, were forced to admit the hegemony of Prussia, after which the North German State was founded in 1867, the beginnings of modern Germany.

SEVEN YEARS' WAR. This general conflict (1756-1763) in central Europe, paralleled by the struggle for supremacy in America between France and Great Britain, broke out when Frederick the Great of Prussia laid claims to Silesia. Maria Theresa had been occupied when Frederick had fought two other wars, but now she prepared to resist. Before she could act, however, Prussia had taken Dresden, but defeat followed at Kolin, 1757. By the end of the year, Frederick was again master of Silesia. The fourth campaign, 1759, brought heavy losses to Frederick, for Russia had joined with Austria, and Saxony broke away from Frederick. Both Sweden and France were now in the conflict, but Peter III of Russia reversed the policy of Empress Elizabeth, and persuaded Sweden to withdraw. Later France also gave way, made a treaty with Prussia and with England, and Maria Theresa was left alone, with Frederick permanently in control in Silesia.

SHAYS' REBELLION. Economic distress following the Revolution caused much suffering in Massachusetts. Daniel Shays (1747-1825), who had resigned as captain in the war in 1780, led a group which demanded the issuance of large amounts of

paper money, reduction of taxes, and abolition of the Court of Common Pleas. Mobs prevented the courts from sitting at Northampton, Worcester, Great Barrington, and Concord. General Shepard with 600 troops, failed to control a mob of like size, which prevented the Supreme Court from meeting at Springfield. Gov. Bowdoin ordered out 4400 men under command of Gen. Benjamin Lincoln. When Shays marched a force of 2000 into Springfield on Jan. 25, 1787, bent on capturing the arsenal, he was confronted by Shepard with 1200 soldiers. The mob dispersed, Shays escaped to Vermont, and fourteen of the leaders were condemned to die. The Legislature passed an act of amnesty, and in the end only one man was convicted. Shays was pardoned in June 1788, and settled at Sparta, N. Y.

SHERIDAN, PHILIP HENRY (1831-1888). American military man, who was graduated at West Point in 1853, served in Oregon against the Indians, became a colonel in 1862, and a major general the next year. He fought in many battles in Tennessee, 18 actions in Virginia, such as the Wilderness and Spotsylvania; defeated Gen. J. E. B. Stuart; and finally helped force Lee to evacuate Petersburg and withdraw from the capital at Richmond. Sheridan's famous ride, celebrated in T. B. Read's poem, from Winchester to Cedar Creek, 1864, saved his army from impending defeat. Following the war he was military governor in the department of Missouri; in 1870 was a guest of the king of Prussia in viewing operations during the Franco-Prussian War; and in 1883 became general of the United States armies. Sheridan was brusque and rigid in discipline, but so fair and kind to his men that he was greatly beloved.

SHERMAN, WILLIAM TECUMSEH (1820-1891). He was born in Ohio, a graduate of West Point in 1840; distinguished himself in the war with Mexico; and engaged in business between 1853 and 1861. He entered the Civil War as a brigadier general, fought at Bull Run, in Kentucky and Tennessee, and gained fame at Shiloh and Corinth. He greatly assisted Grant in the operations leading to the relief of Chattanooga and Knoxville, and in 1864 made a raid across the state of Mississippi. With 100,000 men he set out in June from Chattanooga, laid waste a path through Georgia under heavy opposition, and captured Atlanta and Savannah. Turning northward again, he fought his way through the Carolinas, defeated General Johnston, who had been recalled to confront Sherman, and forced Johnston to follow Lee in offering to surrender. He was made a lieutenant general in 1866, and succeeded Grant as general-in-chief when the latter became president. After holding this highest army rank for 15 years, he withdrew in favor of Gen. Phil Sheridan.

SHILOH, BATTLE OF. Also called Pittsburgh Landing. This second great battle of the Civil War was fought in April 1862 two miles from the river landing and eight southwest of Savannah, Tenn. With the army of the North, Grant had succeeded in ascending the Tennessee River to this point, a hazardous feat. Before some of the Union army under Don Carlos Buell could arrive, however, the Confederates began the attack. They were led by Gens. A. S. Johnston and P. G. T. Beauregard, the total strength being about 40,000. After a disastrous day for the northern soldiers, Grant at last rallied his men, opened better communications, and awaited the coming of Buell from across the river by ferry. Late in the first day, when the Confederates sent some divisions in advance, these were dispersed, and Gen. Johnston was killed. Buell and Gen. Lew Wallace joined Grant's men during the night with 25,000 fresh troops. In the morning the Confederates withdrew toward Corinth. Casualities on both sides were about equal, 10,000 men.

SIAM. Independent kingdom in southeast Asia, which began to flourish before 1400 with the founding of the capital at Ayuthia. In 1759 the Burmese took the city and in 1767 gained control of the entire country. A Burmese king ruled for a few years, until an adventurer from China took Bangkok, then the new capital, set himself up as king, but in 1782 was killed by one of his generals. The general, Yuat Fa, established a dynasty, which rules to this day. In 1820 trade was established with the West; in 1826 a treaty was made with Great Britain. Siam became a member of the League of Nations, and was guaranteed full sovereignty in 1927, when the consular courts were abandoned and new tariffs were effective. Following a bloodless revolution in 1932, this ancient absolute monarchy began a series of reforms, in which the king concurred, but he abdicated in 1934 when the right to pardon criminals was taken from him, and the crown passed to his nephew, 11 years old and at school in Switzerland.

SIBERIA. Vast thinly-settled territory in Asia, now a part of the Soviet system of associated governments, and from 1579 nominally part of the Russian domains of the czars. When the empire extended to the Amur in 1651, Russia came in contact with the Manchus, followed by a treaty with China in 1689, the first made by the latter with a western nation. Russia gave up all claims to the district of the middle and lower Amur, but in 1860 secured land by treaty between the Ussuri and the sea, founding Vladivostok then, which became the chief naval station on the Pacific. During the war with Japan, Port Arthur was lost to Siberian Russia, and Vladivostok again became the chief port. Japan and the United States acted for the allies in 1918 in trying to secure a stable government in Siberia. This attempt and the government of Admiral Kolchak, opposing the Soviets, failed to give permanent relief, and the Bolsheviks were in power late in 1919. By 1925 all the Japanese troops had been withdrawn from Siberia. When the Far Eastern Republic, set up in 1920, gave way to the Moscow authorities in 1922, the Russian empire once more stretched to the Pacific in Asia. Siberia for many years was the home of convicts and political offenders sent from the western part of Russia, a system abolished during the World War, but not entirely eliminated afterward.

SICILY. Largest island in the Mediterranean, a land of varied and colorful history. Though first settled by men from the Italian peninsula, by 580 B. C. Greek immigrants predominated, and Syracuse became a famous city. About 540 B. C. the men of Carthage began to settle on the island, but Gelon of Syracuse routed an invading army and put Hamilcar, the Carthagenian general, to death in 480 B. C. In 410 Dionysius of Syracuse again defeated the invaders from Africa. Rome ruled Sicily from 210 B. C. until 440, when the Vandals took possession. Sicily fell to the Eastern Empire in 535; to the Saracens in 965; to the Normans in 1090; and to Roger II in 1127. The Normans continued to 1194; then the Hohenstaufens until 1266, when Charles of Anjou took control, but the inhabitants revolted in 1282 in the massacre known as "Sicilian Vespers," and then Pedro II of Aragon became their king. For years Sicily was joined with Naples in the Kingdom of the Two Sicilies, but in 1713 the island went reluctantly to the duke of Savoy, who traded it later with Austria for Sardinia. The Spanish Bourbons ruled from 1735 to 1860, then Garibaldi favored the cause of Victor Emmanuel, and in the next year the kingdom of Italy was founded, when Victor Emmanuel annexed Sicily.

SIMS, WILLIAM SOWDEN (1858-1936). A native of Canada, Sims attended the United States Naval Academy and attracted considerable notice through his studies in naval gunnery. During the World War he was made an admiral in command of the American fleet in European waters, in which difficult task he won high commendation. Because he was out of sympathy with the management of the navy during the World War, he declined the decoration voted him by Congress. In 1919 he made to Congress severe criticisms of navy methods and discipline. From 1919 to 1922 he was in charge of the United States War College. With Burton J. Hendrick he wrote (1920) *The Victory at Sea*, a book that won the Pulitzer prize as the best of the year on United States history.

SIX NATIONS. See *Iroquois*.

SLAVERY. In ancient times war captives were forced into slavery; in both Greece and Rome persons sold themselves into servitude. Laws protected slaves from cruelty, death, or exploitation. In 1442 Henry of Portugal started what became a virtual monopoly of kidnapping slaves or buying them from Moorish merchants. The Spanish almost exterminated some Indian tribes through slavery. Mohammedanism allowed slavery, but commanded kind treatment. Spain set up a definite trade in 1517, England in 1553, France in 1624, and other countries followed. Slaves were brought to Jamestown, Va., in 1619 for limited service. Massachusetts legalized servitude in 1641, Connecticut, 1650, Virginia, 1661. After 1788 laws protected slaves in sickness, old age, poverty, marriage, and other civil rights. The United States

Congress abolished the trade in slaves in 1808; in 1815 Great Britain tried to get the Powers to agree to suppress the practice. In 1842 the Ashburton treaty provided a patrol for the African coast to keep slave traders away. The French abolished slavery in 1848, the Dutch in 1863, Hayti in 1791, Brazil in 1888, Ethiopia liberated 2,000,000 in 1931, Liberia agreed to abolish slavery in 1930, and Portugal joined with 19 other nations in signing the League of Nations Covenant abolishing slavery in African dominions. Washington, Jefferson, Jay, and others spoke against slavery; many in the South liberated their slaves long before 1860. By 1840 New England and most of the other northern states had abolished domestic slavery. Quakers early opposed it; so did the Presbyterians in 1787. In 1800 there were about 900,000 in bondage in the United States; in 1860 the number in the South was about 4,000,000.

SOCIALISM. Robert Owen in England and others advocated some form of Socialism long before Karl Marx (1818-1883) set up a system that many modern socialists have followed in their theories. Socialists usually oppose violent and revolutionary means, preferring education and voluntary cooperation. They oppose Communism in its extreme form. Both groups profess to follow Marx. Before the World War pacific socialism had many adherents, the greatest strength being in Germany in 1912, when 110 members of the Reichstag were elected by 4,000,000 voters. Eugene V. Debs, in the same year, polled 900,000 votes in the United States. During the World War the socialists became much divided. After minor gatherings at various times, at last 424 delegates gathered at Hamburg, Germany, in 1923 to represent opinion in 30 countries and some 43 distinct social groups. Some of the common aims agreed upon were to support the movement for an eight-hour day in industry, to support the League of Nations, and to continue hostility toward the Russian experiments. In 1920 the Socialists of the United States had disavowed Bolshevik influence, and the party polled a million votes. After supporting La-Follette in 1924, they turned to Norman Thomas in 1928 and 1932, when they polled at first 300,000 votes, and in 1932 some 885,000. In 1928 in Germany the Socialists elected 152 deputies; Communists only 52. Twice in England the Labor Party elected Ramsay McDonald, but no very radical legislation followed.

SOMME, BATTLES OF THE. The armies of the Germans, French and English, before July 1, 1916, had collected huge stores of ammunition and constructed elaborate systems of trenches and cement placements for guns. After bombardment for seven days, the French and British advanced on July 1. Within a week they took much of the German front line defences, but on July 18 the Germans regained much of the territory by a counter stroke. Within a month or less, the British lost about 180,000. The next great move of the Germans was to plan the so-called Hindenburg line for use in case of retreat. On Sept. 15 the allies first put tanks into action. By November they had captured 28,000 Germans and 800 guns, but their losses were staggering. In these operations, now known as the first Battle of the Somme, the British lost over 500,000 in killed, wounded, captured, and missing; the Germans probably as many, though the reported number at first was somewhat less. In 1917 the Germans fell back to the Hindenburg line. In the second Battle of the Somme, commencing on March 21, 1918, Ludendorff, began an expected attack, against which some 800,000 allied troops had been concentrated. The British under Gen. Gough were forced back three distinct times, and the allied lines showed signs of breaking. A hasty allied council decided to entrust the supreme command to one man, Marshal Foch of France. On March 30, the allies commenced to force the Germans back, and another chance to take Paris was lost. It was the narrowest escape for the allies and the last German push on a grand scale, the last great bid for victory. In the group of engagements known as the second Battle of the Somme, the British loss was about 200,000, and the German 180,000. The Germans brought down 224 airplanes, the allies 838.

SOUTH AFRICAN UNION. This dominion of the British Empire was formed in 1909 by a union of the Cape of Good Hope, the Transvaal, Natal, and Orange Free State. Southern Rhodesia, invited to join the union, in 1923 decided to remain separate. The first three union prime ministers were Gens. Botha, Smuts, and Hertzog, all of whom had fought Britain in the South African War. During the World War, General Botha put down a rebellion, being forced to defeat and capture his old colleague, Gen. DeWet. Botha also took the field against the German African colonies. In addition the Union of South Africa sent 11,000 native soldiers and 10,000 Kaffir laborers to the fields of France. Under mandate from the League of Nations, the Union administers what was formerly the German colony of South-West Africa.

SOUTH SEA BUBBLE. Notorious speculative scheme of a company that promised in 1711 to extinguish the British floating debt of some $50,000,000. The plan was to secure a monopoly of trade in South America and other regions under parliamentary grant, for which the company would pay $3,000,000 yearly. Stock was issued to those who held government annuities or loans to the British state. In 1717 the company gave the government $25,000,000, and in 1720 the organizers promised to take charge of all the debt, which had then reached $150,000,000. For every $500 paid in by shareholders, the value went to $5000 at last. The original promoters then sold out at a huge profit, the crash followed in 1720, thousands lost their savings, and only one-third was saved for the shareholders. The company continued to the 19th century. Several members of the party in power were implicated, some removed from office, a few tried, but almost nobody was punished further. The Mississippi Scheme or Bubble was started in France in 1717, with objects similar to that of the South Sea enterprise. The company designed to develop Louisiana and Mississippi River commerce. The crash came much in the same way, and hundreds were ruined. These are only samples of the fantastic schemes that have taken the money of credulous and simple persons.

SOVIET REPUBLICS, UNION OF SOCIALIST. Organization of many autonomous districts and separate republics, taking the place of old Russia before 1917. The total land area is one-seventh of the earth. The various divisions are these: Russian Socialist Federative Soviet Republic, capital at Moscow, with 14 regions and 11 autonomous republics; White Russia, capital at Minsk; Ukraine, capital Kharkov; Transcaucasia, capital Tiflis; with three large and three minor republics; Uzbek, capital Tashkent; Turkoman, capital Askhabad; Tajikistan, capital Stalinabad. These are administered in a broad way from Moscow, according to Soviet or Bolshevik ideas of state socialism, often called Communism. The chief features have been the division of land among the peasants, which recently tends to take the form of great collective farms, domination of industrial units by local committees, and suppression of all groups save the proletariat. Recently in Soviet Russia there is a notable tendency to allow privileges for the middle class or bourgeoisie, who have been specially scorned in the past.

Since the abdication of Czar Nicholas II on March 15, 1917, many changes in the social, political, and industrial Russia have made this ancient land a familiar subject for dispute by outsiders. Prince Lvov and Alexander Kerensky tried to hold the old Russia together and true to her allegiance to the allies in the World War. Disintegration followed, Russia withdrew from the war, and the Kerensky attempts proved too weak to become permanent. When the Bolsheviki took charge in November, 1917, Nicolai Lenin and Leon Trotsky were dominant figures. Later differences developed between those like Trotsky who demanded extreme measures and some of those who took moderate ground. The royal family was put to death in 1918. Lenin died in 1924, and Trotsky was finally exiled in 1929. Latvia, Lithuania, and some smaller districts had broken away after the World War.

In 1924 a new constitution was proclaimed, and the following year Joseph Stalin became the chief leader. Much complaint followed some of the extreme measures of the Soviets to preserve their industrial and social systems. Bolshevism became almost a state religion in place of the older faiths, while churches were closed, their land was nationalized, and the priests were stripped of much of their authority. State planning replaced other forms of business, most of the industries were gradually collectivised and the whole population was sent to school.—10,000,000 adults each year, mostly for the first time. Of a total of 25,000,000 workers, 19,000,000 joined labor unions. Plans of industry were rushed forward, and all production speeded up. Some 50 power plants were built, a new railway across Siberia was commenced, and the mileage in

1935 in all Russia was 45% over that of 1913. Other signs since 1930 are a definite swing toward democracy and a defensive treaty with France, which caused much comment.

SPAIN. Carthage, Rome, the Suevi, Vandals, and Visigoths, between 238 B. C. and the time when Castile became powerful in the 10th century, contributed little to the permanency of what is now Spain. In 1085 Christianity began to obtain general recognition. Ten years later Portugal set up an independent government. When Isabella of Castile married Ferdinand of Aragon in 1469, the two kingdoms were united. In 1491 the Moors were expelled from Granada; in 1513 Ferdinand won Navarre. Following the voyages of Columbus, Spain entered into an era of colonial and political expansion. At last this was checked in 1588 by the defeat of the Armada, which sought to humble Britain. Nine years before, Philip II had lost the Spanish possessions in the Netherlands. When the Austrian dynasty ended in 1700, Spain was left still further weakened, and then in 1712 Sardinia, Minorca, and Gibraltar fell away from the empire. Spain continued barely to hold her own until after 1800. When Napoleon attempted to place his brother, Jerome Bonaparte, on the throne, Great Britain and Portugal assisted in checking the encroachments of France.

The Spanish possessions in the Americas in 1821 asserted their independence, leaving only Cuba, Puerto Rico, the Philippines, and some other smaller areas of the once powerful colonial empire. Spain for over a century has been troubled by discords among the peoples of her own districts. Catalonia was always restless, and in 1931 even proclaimed the formation of a republic, which was short lived. Troubles with both Germany and France over spheres of influence in Morocco once or twice almost led to war. Cuba, Puerto Rico, and the Philippines, with some smaller islands, were lost after the insurrections of 1896-98. During the World War, Spain managed to maintain neutrality, with some degree of progress. This era was followed, however, by continued unrest because of discords among the various provinces, the rise of a strong socialistic movement, and the growing unpopularity of the reigning house. No party was able to gain a majority in the government for any length of time. After various changes in ministry, Primo de Rivera, from 1923 to 1931, served as a dictator with the support of the army. King Alfonso XIII abdicated in 1931, a republic was proclaimed, with Niceto Zamora as president until his death in 1936. Catalonia was granted autonomy within the republic. Meanwhile, the government drifted more and more toward state socialism, until in 1936 a disastrous civil war broke out.

SPANISH ARMADA. See *Armada.*

SPARTACUS. Rome suffered three times from slave revolts between 134 and 70 B. C. The first in Sicily lasted for two years, and several Roman armies were defeated. In the second, also in Sicily, in 102 B. C. the consul speedily checked the movement. In the third, about 73 B. C., known as the Gladiators' War, Spartacus a Thracian who had served in the army, broke from the camp where he was being trained as a gladiator. He fled to Mt. Vesuvius, and in a few months had 90,000 under his banner. These slaves defeated the army of both consuls. Differences arose as to whether they should cross the Alps, one part was beaten in the north of Italy, and the rest under Spartacus were cut off in retreat, when he was slain fighting valiantly. Spartacus is known for his valor, ability, and humanity in the treatment of others.

SQUATTER SOVEREIGNTY. The Mexican War raised the issue of whether new territory should be slave or free as to New Mexico and California. In the campaign of 1848 the Whigs nominated General Zachary Taylor, who was a slave-holder in Louisiana; the Democrats put up Governor Lewis Cass of Michigan, a mild opponent of slavery. In the campaign Cass stressed the idea of "popular sovereignty," or as it soon was called, "squatter sovereignty." Cass said that residents in each new territory or state should be allowed to decide for themselves. When the question of Kansas and Nebraska came up in 1854, settlers flocked from Missouri into the new territory, on the theory that they could determine by "squatting" or taking up land that the district should be slave territory.

STAR CHAMBER. High court organized in 1487 by Henry VII, but the name itself goes back to Edward III, and is said to have come from decorations on the ceiling at Westminster Palace, where the court met. At first it consisted of the Chancellor, Treasurer, Keeper of the Privy Seal, a bishop, a temporal lord, and the chief justices. Later its composition and functions changed from time to time. Under the Tudors it was an effective law court, dealing mainly with landowners and nobles. Under Charles I it became an instrument for exacting fines, taxes for the lean treasury, and for punishing all sorts of offenses. Torture was frequently used to make accused persons talk. The Long Parliament abolished the Star Chamber in 1641.

STEUBEN, FREDERICK WILLIAM, BARON VON (1730-1794). German-American military leader, who was born in Prussia, served in many battles of the Seven Years' War, and became aide to Frederick the Great. In 1777 he offered his services to the American colonies, did much to train the soldiers at Valley Forge, and saved the day at Monmouth, when he rallied the retreating forces of Gen. Charles Lee. His book on army regulations, prepared for the United States armies in 1779, proved of great benefit in further training. He was a member of the court-martial that condemned Major John André as a British spy, commanded the colonial forces in Virginia, and took part in the final operations at Yorktown. After the war he lived at Steubenville, N. Y. Several states gave him land, Congress awarded him a sword, and later a pension of $2400.

STONEHENGE. On Salisbury Plain, Wiltshire, England stand several huge stones set on end, some of them having a stone across like a lintel. These date from prehistoric times, probably from the Bronze Age of man. No Roman, Saxon, Celtic, or Danish records mention them in early historical periods. Two outer circles of stones, which at first were about 100 feet in diameter, have two horseshoe lines within, and beyond these is a flat marble slab 18 feet long. The entire arrangement suggests some connection with the northeast. Among the legends and theories are those that this was a Druid temple, a Danish monument of some sort, or a Saxon tomb. Excavations between 1920 and 1926 unearthed many "postholes," some possibly older than Stonehenge itself, and in some were found human bones. Near Carnac in France is a similar, but much more extensive set of stones, 1991 in number, arranged in parallel rows, but with circular ones at the ends. Stonehenge was made a national monument in 1918.

STONY POINT. This spot on the Hudson River in Rockland County, New York, was fortified early in the Revolution by the Americans. General Sir Henry Clinton captured the fort on May 31, 1779. General Anthony Wayne, with a force of 1200 colonials, on July 16, surprised the British garrison and captured Stony Point. The Americans lost 15 killed, 83 wounded; the British lost 63 killed, many wounded, and 543 prisoners. The Americans removed the equipment of the fort, but the British occupied the place later. Stony Point is now a state park.

STRATHCONA AND MOUNT ROYAL, DONALD ALEXANDER SMITH, BARON (1820-1914). He was a native of Scotland, served with the Hudson's Bay Company in Labrador and on Hudson Bay, and became resident governor in 1868. Smith became a great railway and empire builder. His standing in the western territory prompted the Canadian government to send him to quiet the half-breeds there after Riel's rebellion. In 1870 he sat in the Manitoba assembly, in 1871 was a commissioner of the North-West, and in 1872 a council member at Winnipeg. Having bought a railway line, he completed connections from east to west. He served in the Dominion Parliament in 1896, after which Canada sent him to be high commissioner in London. He became a peer in 1897. During the war in South Africa he equipped 600 horses and sent them to assist in the war against the Boers. Lord Strathcona did as much as any other man to promote good feeling between Canada and the rest of the British Empire.

STUART, JAMES EWELL BROWN (1833-1864). A valiant cavalry leader of the South in the Civil War; known to his friends as "Jeb" Stuart. He gained fame for his courage and ability at Bull Run, Antietam, Gettysburg, and the Wilderness. Stuart helped save the Confederates at Fredericksburg, took command when Stonewall Jackson fell at Chancellorsville, and made a determined stand at Yellow Tavern against Gen. Phil Sheridan, but was mortally wounded.

STUART KINGS. For the Stuarts who ruled in England see James I, James II, James, the Young Pretender, Charles I and II in section of *Rulers and Statesmen.*

STURDEE, FREDERICK CHARLES DOVETON (1859-1925). British admiral, whose fleet attacked and destroyed a German fleet off the Falkland Islands on Dec. 8, 1914. He entered the navy in 1871, and became successively commander in 1893, captain in 1899, rear admiral in 1908, admiral in 1917, and admiral of the fleet in 1921. His chief service was in Egypt, Samoa, in the Mediterranean, and the English Channel in 1907. During the World War he was made chief of staff in 1914, commander in the South Atlantic and Pacific, and commanded the 4th battle squadron in the battle of Jutland. In 1916 he was created a baronet. In the battle of Falkland, six British cruisers sank two armored cruisers, two light cruisers, supply ships, while one German light cruiser escaped. British casualties were 6 killed, 19 wounded; the German, all the crews save 212 men rescued by the British lifeboats. See also *Falkland Islands.*

SULLA, LUCIUS CORNELIUS (138-79 B. C.) He named himself Felix. A Roman general of the patrician class, who captured Jugurtha in the campaign against him in 106 B. C., being a member of the cavalry under Marius. The latter became jealous of Sulla because of successes in the campaigns against the Teutons and in the social war. Civil War resulted, Marius fled to Africa, but returning while Sulla was absent, he killed many Romans. Sulla came back after the Mithradatic War and was appointed dictator. Though Marius had died, it took several years to subdue his party.

SUMERIANS. Little was known about these early people until Sir Henry Rawlinson and others after 1850 obtained the key to the reading of clay tablets found in the library of Ashurbanipal of Assyria. The characters are wedge-shaped and were made by denting soft clay with a stick, and then by heating the tablets to preserve them. About 350 signs were used, making a most complex alphabet, the symbols being wedge-shaped, hence called *cuneiform,* from the Latin word meaning *wedge.* The Sumerians flourished about 3500 B. C., being far ahead of their neighbors of Egypt in the great pyramid ages. The chief Sumerian remains are found in central Asia. They were not a Semitic people, but resembled more nearly the modern Hindu, engaged in war on a large scale, but seem inferior in arts, save in writing. Their language and literature lasted until after 1500 B. C., though as a people they were overrun by tribes of the east, mainly Semitic, long before this time. Their houses were made of sun-dried bricks, and several layers of these are unearthed by excavations in Babylonia. Unlike the Egyptians and other early peoples, they seem to have left no very large monuments. The men went clean-shaven, cut the hair close, sometimes shaving it as did the Egyptians, but wore no wigs. Many excellent clay portraits of individuals have been found.

SUPREME COURT. Article III, sections 1 and 2 of the Constitution of the United States specifies that the judicial system shall consist of a Supreme Court and "such inferior courts as the Congress may from time to time ordain and establish." The states at an early date, however, insisted that the Supreme Court should not be allowed to try cases between a state and an individual, but could hear suits between states. The Eleventh Amendment to the Constitution so provided. The first general judiciary act, Sept. 24, 1789, provided that the Supreme Court should consist of a chief justice and five associate justices. In 1807 the number was increased to six, in 1837 to eight, and in 1863 to nine. Congress attempted to reduce the number in 1866, but a reversal of opinion fixed the number at one chief justice and eight associates, before the 1866 act could take effect.

In the famous early case of Marbury v. Madison, Chief Justice Marshall declared that it is the duty of the Court to declare acts unconstitutional when Congress has overstepped some part of the Constitution in legislating. Though this idea, on the whole, has met with public favor, nine or ten decisions have caused much comment because they were by close vote of the court, most of them disputed because of a five to four vote of the nine members. The Dred Scott case in 1855, one of the split decisions, did much to precipitate the Civil War. Several recent decisions, notably the five to four decree in the Gold Clause case, have also led to further discussion as to whether Congress or the Court should determine what agrees with the Constitution, or what is best for the people of the country.

SUSA. Known in the Bible as Shushan, this ancient city was the capital of Elam, until taken by Ashurbanipal about 660 B. C., then of the Persian empire under Darius and his dynasty, and then the seat of the oriental empire of Alexander the Great, 331 B. C. Several detailed references occur in ancient literature, such as a full account of the conquests of Ashurbanipal and Alexander. Since 1850 excavations have unearthed a citadel, the palace of Darius, many beautiful inscriptions, much artistic tiling, some of it now in the Louvre at Paris. In 1901 the Code of Laws of Hammurabi was located, the most enlightening ancient statutes that we have. Pottery from the Neolithic age was located about 25 meters under the surface; higher up, vases made by the wheel of the potter, Greek objects, coins, and many other art creations. Mohammedan tradition mentions the tomb of Daniel, the Hebrew prophet, at Susa, but this is not yet clearly identified. Susa flourished until about 1300 in our era.

SWEDEN. After 1300 the Goths in the south and the Swedes in other portions of modern Sweden, united to form one country. Previous to this the Yngling and Folkung lines had ruled, and Christianity got a foothold before 900. In 1397 Denmark and Sweden were loosely united, but, after several struggles, Gustavus Vasa drove the Danes out and became king in 1523. His line was made hereditary, but in 1600 Charles IX replaced Sigismund, who was king of Poland and after 1592, of Sweden. During these years Protestant influence replaced that of the Jesuits. Gustavus Adolphus, son of Charles, made Sweden a world power, but his daughter, Christina, in 1654 resigned the crown to her cousin, Charles X, who defeated his Polish rival and finally expelled the Danes. In 1660, Charles XI made an agreement with his Polish cousins, but gave up Livonia and Estonia. Then Charles XII waged wars with Denmark, Poland, and Russia, but left no direct heir, and his sister and her husband, Frederick of Hesse, were given the crown. In 1814 Sweden acquired Norway, and the French Bernadotte was declared heir in 1810, succeeding Charles in 1818. From this time until of late, Sweden exercised little influence in European politics, but became known for pacific aims and great internal prosperity. Norway broke off in 1905 by a peaceful separation. Sweden became neutral in the World War, suffered much from loss of shipping, and in 1918 occupied the Aaland Islands, the inhabitants of which in 1917 had requested alliance with Sweden rather than with Finland. After the World War, Sweden agreed to dismantle her forts in the Islands, and the League of Nations gave them to Finland, thus settling a dispute of long standing.

SWISS CONFEDERATION. Julius Caesar fought the Helvetii in 58 B. C., and Augustus subdued them in 15 B. C. In 450 the Burgundians and Alemanni conquered Helvetia, as Switzerland was then known, dividing the country into two parts, with the Alemanni east of the River Aar. Rudolph of Habsburg gained the throne in 1273, but the cantons of Uri, Schwyz, and Unterwalden joined with Zurich and expelled the Habsburgs in 1315. Austria was fully expelled in 1388, and Aargan was taken from Austria in 1415. The Swiss overcame Charles the Bold of Burgundy in 1476, and Maximilian in 1499 in six hard battles. In 1513 the Confederation had 13 cantons; in 1798 a republic was formed; in 1803, Napoleon aided the Swiss and six cantons were added; in 1815, the number became, as at present, 22. The Congress of Vienna in 1815 guaranteed the neutrality of the Swiss, and Valais, Neuchâtel, and Geneva were added from French territory to the Confederation. During the World War, Switzerland remained steadfastly neutral, despite efforts to get her to take sides. With the establishment of the League of Nations at Geneva, much prestige came to Switzerland.

SYRACUSE. Founded by Corinthian settlers in the 8th century B. C., Syracuse by the middle of the 5th century was widely known. For about 50 years dating from 467 B. C., Syracuse was a free democracy. Meanwhile, Athens had miserably failed in attempts to conquer Sicily, when other Greek tribes sent armies to assist Syracuse in one of the campaigns of the Peloponnesian War. The forces of Athens were cut down on land, and their ships almost totally wrecked off the shores. If Greece had won in this conflict, the western civilization for centuries

might have been Grecian, rather than Roman. When the Romans at last took Syracuse in 212 B. C., little impression was made, the city declined, and never again became a great power in the Mediterranean. After the Saracens took Syracuse in 878, the city rapidly disintegrated.

SYRIA. Since 1920 a state of Asia under mandate of France and formerly a Turkish province after 1840. Syria suffered from numerous conquests by ancient empires, some of them being Assyria in the 8th century B. C.; Persia, two centuries later; Alexander the Great, 334 B. C.; next the Selucid empire; and finally the Romans under Pompey in 64 B. C. When the Roman world split into halves, Syria remained part of the Byzantine or Eastern Empire until the Arabs came in 636. Then Syria fell to the Egyptians, after the Mohammedans had managed to hold out against the Crusades. During most of these changes, the land suffered little, but after the Mongols came in 1260, decline was pronounced, and from 1516 to 1840, Syria was in control of the Ottoman Turks. In the 19th century the Druses massacred great numbers of native Christians and others in Syria. On Oct. 1, 1918, Gen. Allenby, of the British army in Asia, captured Damascus, and by the end of the month had control of the entire country, including the railway to Bagdad. By the Treaty of Sevres, 1920, France was awarded a mandate over Syria by the Supreme Council of the League of Nations.

TAMERLANE. See under *Timur*.

TAMMANY HALL. Political organization in the City of New York, named for an Indian chief, and dating from 1789. Helped secure the vice presidency for Aaron Burr, 1801; was incorporated as a charitable society in 1805; and has always done much relief and social work among the poor of New York. The first Hall of the Society was built in 1811, second in 1867, and the present one in 1929. Affairs of the organization are managed by a small committee, the chairman of whom has been called a "boss." One of these, William M. Tweed, accused of tremendous frauds, was exposed in 1871, tried, and died in prison, while suits against him were pending to force the return to the City of $6,000,000 from the "Tweed ring." In 1886 Richard Croker became boss, and Tammany came back into its old-time vigor. The power of Tammany is gained by an elaborate organization of committees, ward workers, and an effective central control; second, by appealing to voters through charity, aid in obtaining jobs, medical and legal assistance for the unfortunate, and other methods.

TANNENBERG, BATTLE OF. During the last week of August, 1914, a Russian army of 230,000 was defeated with great loss by 130,000 Germans under command of Gens. Ludendorff and Hindenburg, the latter of whom had been recalled from retirement to conduct the main campaign. The Russians allowed themselves to be led on by the enemy, which seemed to be retreating. Samsonov, in active charge, had only two weeks before arrived from sick leave in the Caucasus. He was unfamiliar with the ground, the communications were bad, the men in need of food and shelter. Besides, the wireless messages and orders had been intercepted by the Germans. The Russian center fought valiantly, the XV corps bearing the brunt of the German attack, while the Russian wings gave little help. About 2000 men from this and the XIII succeeded in escaping. The Russians had 132 battalions, 96 squadrons, 620 guns (only 13 of them heavy), while the Germans had 155 battalions, 48 squadrons, and 818 guns, 128 of them heavy. The Russian losses were about 70,000 killed and wounded, 90,000 prisoners, and 200 guns.

TEMPERANCE SOCIETIES. Agitation to curtail the use of strong drink began before 1800. In the House of Lords an energetic speech was made in 1743, and the novelist Smollett, by ridicule, hot and invective, spoke against excessive drinking, quoting the sign on the public inn, "Drunk for 1d., dead drunk for 2d." At New Ross, Ireland, in 1829 the first temperance society was formed. From 1821 to 1850 the Foreign Temperance Society agitated in many parts of the world. Father Theobald Matthew, an Irishman, swept the country by storm, gained 4,000,000 converts, and then went to England and America, where he had a large following. Consumption of drink in Ireland fell off one-half during his campaigns. John B. Gough, from 1840, became a flaming crusader in the United States. In 1842 the New York Temperance Society had 4,000,000 adherents. In 1850 the Independent Order of Good Templars was organized at Utica, N. Y., and then in hundreds of communities.

The **Women's Christian Temperance Union** was founded in 1870, the World W. C. T. U. in 1883, and the Anti-Saloon League in 1895, growing out of a movement in Oberlin, Ohio, and elsewhere. The League did much to secure local option in various states, and finally national prohibition. Both the League and the W. C. T. U. have led in temperance propaganda, use of radio, pictures, drama, and other aids. In 1926 there were in the United Kingdom and Irish Free State, some 49 national societies; in the United States, 15; in Australia, 12; Holland and Sweden, six each. As early as 1642 Maryland passed a law against drunkenness. Indiana had local option in 1842, by which various small districts can vote as to whether they desire license or not as to liquors. In 1900 one-third of the United States was under local option; in 1911, 33 states had some provisions for it. See *Eighteenth Amendment*.

TEUTONIC KNIGHTS. During the siege of Acre in 1190, a brotherhood of German knights was organized by Crusaders in Palestine. Pope Clement recognized the order in 1191, and seven years later the plan was changed to a knighthood with political aspirations. Having withdrawn from Palestine, the Knights made war on the heathen Prussians in the Baltic regions of Europe, subdued them, and forced Christianity on their subjects, after wars lasting for fifty years until 1283. They gained control of Livonia and Courland, waged wars with Lithuania for territory, and finally after 1300 extended their possessions to Danzig and Pomerania. At Tannenberg the Polish king, Ladislas, 1410, defeated the Knights in battle, and from then on their power began to decline. Napoleon suppressed the organization in the Prussian region, but it was revived in Austria twenty-five years later.

THAMES, BATTLE OF THE. In 1813 the British crossed into Ohio from Canada, took Fort Meigs, but were beaten at Fort Stephenson. Then Perry cleared the lakes of hostile craft in his battle of Lake Erie, and the Americans again crossed into Canada, where they pursued the retreating British commanded by Gen. Proctor. On Oct. 13, 1813 the British and Indians, the latter under chief Tecumseh, halted to meet the Americans commanded by Gen. Harrison. The American cavalry soon broke the lines, most of the British withdrew, and the Indians fought stubbornly. Tecumseh was slain, the alliance between Indians and British was terminated, and American losses of the year 1812 were compensated.

THEBES. Magnificent city of ancient Egypt, 300 miles south of Cairo, on both banks of the Nile. Between 1600 and 1100 B. C. it was the capital, replacing Memphis, during the XI to the XVIII dynasty. The temple of Karnak, some of the royal tombs, and other monuments date much farther back. Recent interest has centered in the Valley of Tombs near Thebes, where in 1922 the magnificent collection of objects in the tomb of Tutankhamen (ruled 1360-1350 B. C.) was discovered. At present the site of Thebes is occupied by houses of natives who act as guides to the neighboring ruins, such as Karnak, Luxor, the tombs, palaces, and other extant remains. Amenophis III built three new temples and connected two with the older one at Karnak by the avenue of sphinxes. These remains now cover three miles square. Ikhnaton, son of this emperor, withdrew to Amarna, and set up a new monotheistic worship of the sun, to replace the old gods of ancient Egypt. After 20 years a new dynasty of Seti I and Remeses II added greater splendor to Thebes. With the rise of other cities after Remeses, moving of the capital of Egypt from place to place, and changing ideals of the pharaohs, the ancient capital began to lose favor. In 668 the Assyrians carried off many treasures, and Augustus almost destroyed Thebes. Despite the ravages of ages, the burning of some of the buildings to make lime, and characteristic oriental neglect, Thebes today has the most extensive area of magnificent ruins to be found anywhere in the world.

THEMISTOCLES (c. 514-449 B. C.). An Athenian leader, who advocated a large navy, opposed Aristides the Just, and for ten years ruled almost unopposed. When Xerxes of Persia came with a great army and powerful fleet, the Athenian commander remained timid and inactive. Themistocles

let the word go to the Persians that Greece should be attacked at once, or the ships would get out of the harbor. Xerxes immediately began the battle, which was a complete victory for the Grecians, and Themistocles greatly increased his personal fame. He rebuilt the ruins left by the invasion, fortified anew the harbor of the Pireaus, reduced the tax on foreigners, and so attracted many from other lands, and all the time kept Sparta guessing as to his moves. In the end the Athenians began to distrust him and finally ostracised him, after which he fled to Argos, then to Corcyra, and at last to Asia, where he died.

THERMOPYLAE. Name of a narrow pass between the northern and southern parts of Greece, the name meaning, literally, *hot gates*, because of the hot springs in the pass, which is two miles at its widest and narrows at the center to a few yards. Here an immense force of Persians, commanded by Xerxes, encamped and sent word to Sparta that the Greeks should withdraw and let them through the pass. Leonidas of Sparta sent word for the Persians to come and take Thermopylae. He had but 300 men of his own, some freedmen, and allies, amounting in all to about 10,000 men. An attacking party was beaten off, then Xerxes sent his 10,000 "immortals" against the pass, but these, and later the whole army were held off for two days. The Persians bribed a Greek to show them a way around, and so they came upon the rear of the Spartan guard. Leonidas, seeing the case was hopeless, dismissed his allies, save that 700 Thebans chose to remain with him. They were cut down by the arrows of the Persians. Winning the battle gained the Persians little, and they learned then that the Greeks were no mean foes. Antiochus III of Syria, in 191 B. C., suffered utter defeat there. Brennus and his Gauls in 279 B. C. gained a victory at Thermopylae by using much the same methods as those of Xerxes.

THIRTY YEARS' WAR. Austria, some of the Catholic princes of Germany, and Spain carried on a series of wars against various opponents from 1618 to 1648. Four different struggles may be described. First, Frederick, Elector Palatine, who had been made king of Bohemia, was driven out of the lower provinces of the Palatinate. Second, Christian IV of Denmark, coming to the aid of German Protestants, was obliged to conclude a disastrous peace. Third, Gustavus Adolphus of Sweden conquered Pomerania and Mecklenburg, and won the important battle of Lutzen (1632), but he was killed, and the Protestant cause received a check under his successor. Fourth, Sweden again came to the help of France against the Habsburgs. After several years of diplomatic exchanges, the Peace of Westphalia at last frustrated all attempts of Austria and Spain to restore their religion in Germany and to make Germany part of the Habsburg state in central Europe.

TICONDEROGA. In 1755 the French built a fort at the outlet of Lake George, 100 miles north of Albany, New York. Three years later this was attacked by the British and colonials, but was saved, though the French abandoned it and Crown Point the following year. Both of these forts were enlarged and improved by the British at a great cost. In 1775 only 50 men were stationed at Fort Ticonderoga, and Ethan Allen, with some of his Green Mountain boys, captured the fort during a surprise attack. Gen. John Burgoyne again took charge for the British in 1777, and the fort was newly garrisoned in 1780, but after the close of the Revolution was allowed to fall into neglect. Ticonderoga now contains an interesting collection of colonial relics.

TILLY, JOHANN TSERKLAES, COUNT VON (1559-1632). Military genius, born in Brabant, general in the Thirty Years' War of the Catholic army, and successor in 1630 to Wallenstein as commander-in-chief of all the forces of Germany. His early successes include the defeat of Baden at Wimpfen in 1622; of Christian of Brunswick at Hochst in 1622 and at Stadtlohn in 1623, after which he was created a count of the empire. Next, he humiliated the king of Denmark at Lutter in 1626, and with Wallenstein compelled the Danes to make peace at Lubeck. Tilly now entered upon a period of ill success; for Gustavus Adolphus routed his army in 1631, after which the Swedes and allies drove Tilly into Bavaria, and made him cross the river under heavy fire, during which he was fatally wounded.

TIMUR (1336-1405). Also known as Timur-i-Leng, which in English is Tamerlane or the Timur who is Lame. Though like his father at first a studious reader of the *Koran*, he turned to the military life at 22 and became the most renowned conqueror of his generation. By 1369 he had crushed all opposition from native princes and had assumed the throne at Samarcand. Within the next twenty years, he had subdued to his will much of Persia, Georgia, and neighboring lands. When more than 60, on hearing of civil commotion in India, Timur went thither with a great horde of followers. With the help of a grandson, he took the various cities and states until he came to Delhi, where it is said he put about 100,000 to the sword, and so gained the notoriety of being one of the great butchers of all time. In April 1399 he was back in his capital, with a tremendous store of booty. Turning to the west, he captured Bagdad, Aleppo, and Damascus on the way to conquer the Turks and Egyptians. At Angora in 1402 he deposed the sultan Beyezid I, and carried him along as an exhibit on his march. He died while planning a raid on China. The empire of Timur stretched from the Volga to the Persian gulf, and from the Hellespont to the Ganges. Marlowe made him the hero of his early tragedy.

TIPPECANOE. During the settlement of Indiana Territory, the Indians made a raid on the new stockade at Terre Haute. William Henry Harrison, with a force of about 800, went to a point on the Tippecanoe River, now about six miles north of Lafayette, Ind. Here the Prophet, a brother of the chief Tecumseh, was inciting the Indians against the new settlers. Led by three chiefs, the red men attacked Harrison's camp on Nov. 7, 1811, but were beaten off after a desperate fight of two hours. The Americans lost about 180 men; the Indian loss was unknown, but Harrison thought they had about 6000 braves in the battle, with many casualties. The results of this conflict helped drive the Indians to side with the British in the campaign of 1812.

TIRPITZ, ALFRED VON (1849-1930). Entered the navy in 1865. Became admiral in 1911. After 1897 his work was mainly administrative until he resigned his command and all honors in 1916. Through his efforts, the development of the German navy was largely due. He decried any measures that would antagonize other nations, and in 1914 did not heartily favor war. After Germany entered the conflict, he favored a decisive naval battle, but others overruled him. After the World War he entered the Reichstag as deputy of the German National Party. He favored the Dawes Plan, but spoke against the Pact of Locarno.

TOLTECS. Obscure people said by the Aztecs to be the founders of culture and the arts in Mexico, where they flourished from 900 to 1100. Their great national hero was Quetzalcoatl. According to the Aztec and Mayan legends, the Toltecs lived near the ruins now extant at Tula, also at Cholula, and in the vicinity of Mexico City to the northwest. Some believe these early people came from the north, and in turn were displaced and driven into what is now Guatemala by other tribes from the north.

TORIES. Popular name for the Loyalists, or those who sided with the mother country at the time of the Revolution. The Loyalists came from the office-holding class, ministers and other professionals, landed proprietors, wealthy merchants in cities, and natural conservatives. John Adams estimated the Tories in the original colonies at one million, or a third of the total population. New York had the greatest number of all the colonies, led by the "DeLancey party" or "Episcopalian party," as they were then called. Over 23,000 troops from New York fought on the British side. The "Loyal Greens" and "Tory Rangers" served under Gen. St. Ledger in the Burgoyne campaign, and some of them in the Cherry Valley and Wyoming massacres, but Gen. Sullivan at Newtown (now Elmira) checked the Tory enlistments by his victory. Severe restrictions on Tories were passed by all the colonial legislatures, some of which were not removed until after the second war with Great Britain. In many instances, property was confiscated, and over 60,000 Loyalists went into exile between 1775 to 1787, most of them to Canada, where Ontario and New Brunswick were settled in part by them. In

Canada they were known as United Empire Loyalists. When the various states delayed recognition and compensation to the Tories for property destroyed or confiscated, Great Britain held possession of the forts in the Northwest Territory until 1796. Eventually, the British government paid about $30,000,000 to satisfy the claims for property damages.

TORONTO. Provincial capital of Ontario and second largest city in Canada, Toronto is a beautiful residence, school, and official city. In Indian the name Toronto means "a place of meeting." Long before the white men came, Indians gathered there for their pow-wows. French traders settled there in 1749, but the British soon arrived, and in 1793 the French destroyed their fort at this point. In 1794 Simcoe, the governor of the province of Upper Canada, moved the official residence to Toronto, giving it a new name, York, honoring the second son of George III. In 1812 the government buildings were burned, and the town pillaged, but in 1834 Toronto had 10,000 people and was made a city. The present parliament buildings are impressively set in a large park in the center of Toronto, and near are the University, which is famous for its researches in health and medicine, other colleges, hospitals, and fine residences.

TOURNAMENTS. Geoffroi de Preulli, a French baron, killed in 1066, is said to have invented tournaments. These were exercises, friendly in nature, but imitating the arts of war, such as attack, defense, attempts to unhorse an opponent, or to cause him to retreat. Both the Council of the Lateran in the 12th century and Henry II in England forbad tournaments. Yet they flourished on a grand scale in England in the reign of Richard I, who granted licences to hold them. Many went from England to witness the tournament on the continent. Jousters or professional knights went from place to place. Edward I, while still a prince, led 80 knights in a tournament on the continent. Part of coronation and wedding ceremonies were sports in the lists. In 1292 laws were enacted making the conduct of tournaments more careful, but many met death or serious injury in these sports. After 1500 when Henry II of France died from a hurt in a tournament, the sport fell into neglect. Later tournaments became pageants, exercises in sword play, mock encounters by clowns, or other diversions. In 1839, at Eglinton Castle, Ayrshire, a tournament was held in imitation of the ancient manner, as described in Disraeli's *Endymion.*

TOURS, BATTLE OF. Here at the capital of Touraine, Charles Martel in 732 checked the advance of the Moors into northern Europe. In 711 these Arabians poured over the Mediterranean into Spain and ended the Visigoth kingdom; then they captured Narbonne across the Pyrenees in 720; and proceeded into Gaul as a source of further plunder. For a time the invaders took advantage of a conflict between Martel and the duke of Toulouse, while they plundered along their way from Bordeaux toward Orleans. At Tours, Charles met the Arabs with a large army, drawn up in a solid frontal formation. The Moors could make no progress against this "immovable wall." By night the Arab chieftain had been killed, and by morning, when the Franks again sought to renew the battle, nothing was found in the tents where the invaders had camped. With troubles in Africa that arose about this time, this battle ended the threats of Moorish conquest in what is now modern France.

TRADES UNIONS. The earliest union of workers in this country seems to have been the society of journeymen shipwrights in New York in 1803. Others followed, such as the carpenters, 1806; tailors, 1806; printers, 1817; and shipwrights in Boston, 1822. These were local crafts unions, organizations in single trades only. By 1836 crafts had 300,000 union men. These early organizations were social, charitable, and some secret societies; some aimed to keep secrets or monopolies of their trades. After 1850 combinations of local unions began, such as the typographers, 1850; stonecutters, 1853; moulders, 1859. In 1866 the National Labor Union was organized; in 1869, the Knights of Labor. These and others gave way to the American Federation of Labor in 1881, the most important amalgamation of unions today. Robert Owen's *Free Inquiry,* 1825, stimulated ideas of union and labor cooperation. Miners unions were admitted in 1887. About 15% of all workers are members of some general union today. Many plants have shop or individual company unions; most of these are unaffiliated with other groups.

The A. F. of L. comprises five industrial departments, loosely bound together by common aims, but all having much autonomy in their trades or crafts. From 1910 to 1930 membership increased from 1,560,000 to over 3,400,000. Local unions in 1921, 36,250; in 1930, 29,226. Samuel Gompers for many years was president of the Federation, he being followed by William Green. The Pan-American Federation of Labor, formed in 1922, has 20 national groups in 14 American countries, with United States and Mexico leading. Three large international organizations exist in Europe,—one at Amsterdam, with 14,000,000 members; one at Utrecht of Christian Trades Unions, with 200,000 members; and the Russian International, founded, 1924, having central office at Moscow, with 13,000,000 members.

TRAFALGAR, BATTLE OF. Napoleon had intended to try to invade England, but the failure of his fleet in the Atlantic caused him instead to send his army against Austria. The French admiral, having been beaten off the West Indies, retired to the harbor of Cadiz, and seemed reluctant to come out. At last Napoleon ordered him to go through the Mediterranean to support the campaign on land in Austria. Nelson had posted his smaller ships near the shore to watch the harbor, while he took the main fleet out to sea over 40 miles, and there stood ready. Of the 27 British warships in action, Nelson's subordinate admiral, Collingwood, was given control of 15. When the French and Spanish fleet came out of the harbor, Nelson's line of battle was too far off to be seen, while Nelson kept himself informed through signals from his ships along the shore. When the allied commanders found a much larger number opposed to them than they had dreamed were near, they realized it was too late to change their plans. Collingwood was able to engage the last 12 ships of the allies, and Nelson to sail through the line of enemy ships, raking them as he crossed the course. Twenty of the allies ships, 60% of the entire fleet, were captured, with a great loss of life. Nelson himself, in the moment of victory, died of a wound from a musket bullet.

TRANSJORDANIA. An Arab state constituted under the mandate for Palestine given to Great Britain after the World War. The country has a legislative assembly of 22, a king, who in 1935 was Abdullah, second son of former King Husein of Hejaz and brother of King Feisal of Iraq. In 1924 Hejaz (now called Saudi Arabia) transferred three districts to the Transjordan, and in 1933 the governments of the two countries agreed on a mutual scheme of defense of their borders against raids from neighboring tribesmen. The Transjordan is largely desert, except for a few portions, contains about 16,000 square miles, and a population of about 300,000 mostly nomad Arabs, including 30,000 Arab Christians.

TRANSVAAL. Since 1909 one of the parts of the South African Union, which before 1900 was known as the South African Republic. Descendants of the early Dutch colonists in Cape Colony in 1836 made a "great trek," which took them across the land that later was set up as the Orange Free State, into the promised country beyond the Vaal River. After financial difficulties in the Transvaal, England annexed the territory in 1877, but the native Dutch or Boers revolted in 1880, were defeated at Majuba Hill the next year, and again given self-government that season. In 1884 the discovery of gold in the Transvaal brought a horde of adventurers, mining men, and other foreigners, but restrictions and heavy taxes were put on these "Uitlanders." Finally, in 1895 Dr. Jemeson made a raid into the Transvaal, the design being to free the newer settlers from Boer domination. The South African War followed in 1899, after which both the Transvaal and Orange Free State became part of the British domains. In 1906 Transvaal again was given self-government, and in 1909, with Orange Free State, Natal, and Cape Colony, was formed into the Union of South Africa, a British dominion. See *South African Union.*

TRENT AFFAIR. Capt. Charles Wilkes of the United States boat *San Jacinto,* 1861, stopped the British mail steamer *Trent* on the high seas and forced the captain to deliver two senators, Mason and Slidel, who had been commissioned by the Confederate States to negotiate in France. These

men were taken to Fort Warren in Boston harbor for imprisonment. On demand of the British minister at Washington, they were released, and apologies were made by the northern government. Both President Lincoln and Secretary Seward agreed that taking two men from a neutral boat was indefensible; especially so in this case, for the *Trent* was bound from Havana to St. Thomas in the West Indies.

TRIPLE ALLIANCE. In former times the name for an alliance between England, Holland, and Sweden (1668) for the purposes of saving the Spanish Netherlands, now parts of Holland, from the designs of Louis XIV. Other triple alliances, in recent periods, are probably even better known. Some of these are (1) an agreement formed by Britain, France, and Holland against Spain (1717); (2) one between Britain, Russia, and Austria in the time of revolutions in Europe (1795), mainly to protect themselves against France; (3) one between Germany, Austria, and Italy for mutual defense and progress. This last was made about 1883, was renewed from time to time, and in theory was effective when the World War broke out. Italy refused to assist Austria, saying that the latter was not attacked, but instead was an aggressor in the war, and at last Italy joined the allies against Germany and Russia. During this period, France and Russia had an agreement for mutual protection; and with England, these two countries formed the Triple Entente, opposed to the Alliance, and these two arrangements were supposed to keep the "balance of power" and secure the peace of Europe. In most cases, the texts of treaties covering these alliances have never been published in authentic forms.

TRIPOLI. Also called Tripolitania. Since 1912 this district in northern Africa, formerly a Turkish vilayet, has been controlled by Italy. The Phoenicians early founded three cities in the territory west of Cyrenaica along the eastern Mediterranean. Carthage, Greece, Egypt, and Rome successively ruled this district. After 400, numerous changes in sovereignty occurred, with the Vandals, then the Arabs after 600, Tunisia, the Normans of Sicily in 1146, independent from 1321 to 1401 (except for 1354-69), and from 1526 to 1553 by the Knights of St. John, when the Turkish princes took charge. For years the pirates of Tripoli were bombarded by the powers of Europe, even after 1714 when Tripoli became almost independent, merely paying tribute to Constantinople. In May 1801 the United States refused longer to pay an annual levy of some $83,000 to insure freedom from molestation of commerce in the Mediterranean. The Americans sent over a fleet, which blockaded the ports of Tripoli. The frigate *Philadelphia* with her commander and crew were impressed into virtual slavery. In 1805 the pasha gave up his demands, but received a tribute of $60,000 for the release of the American prisoners. In 1815, after further piracies, the Tripolitans were brought to account by Bainbridge and Decatur of the U. S. Navy. (See articles on *Decatur* and *John Paul Jones*.) In 1835 the Turks again took Tripoli, but in 1881 the French occupied Tunisia, and Italy, after a war in 1911, assumed control of Tripoli, which finally in 1928 was firmly established.

TUDORS. Owen Tudor, a Welshman, was the father of five children, the eldest son being Edmund (b. about 1430), who became Earl of Richmond in 1453, and in 1455 married Lady Margaret, daughter of John Beaufort, the duke of Somerset. A child, born three months after his death, became Henry VII. The other four Tudor monarchs were Henry VIII and Edward, Mary, and Elizabeth, his three children. The Tudor dynasty began to rule in 1485, and became extinct in 1603, when the crown passed to James VI of Scotland, of the house of Stuart, who became James I of England. For individual Tudor monarchs, see *Biography* section.

TURKEY. The Ottoman Turks appeared in western affairs in 1227, and Orkhan (1326-1359) first made the Turks a power, and exacted tribute from neighboring Christian states. Amurath I (1359-1389) took possession of the Balkan peninsula, but the great Timur's Mongol hordes were too much for Sultan Bayezid (Bajazet) in 1402. Amurath II (1421-1451) conquered the Hungarians and Macedonia, and his son Mohammed II in 1453 took Constantinople and thus ended the eastern Roman or the Byzantine empire. Three years later he besieged Belgrade, but the city was saved by the heroic John Hunyadi. Serbia and Bosnia fell to the Turks a few years after this. Belgrade at last capitulated in 1521 under Suleyman the Magnificent (1520-1566), under whom the empire attained its high point of splendor. The fleet of Venice, Spain, and the Pope at Lepanto, 1571, dealt the Ottoman power a severe blow, and the decline of Turkey was halted only for a time by the capture of Bagdad by Murad IV (1623-1640). After internal troubles, Turkey suffered another great check when Charles of Lorraine and John Sobieski of Poland routed the armies of the sultan near Vienna in 1682. Further incidents in the political decline of Turkey are these: Loss of Buda to Austria in 1686; end of rule in Hungary, Transylvania, and Podolia in 1718; loss of the Crimea and other districts to Russia in 1774; loss of Greece in 1828; troubles with Balkan districts as to treatment of subject peoples, from 1856 to the World War; rise of Russian influence in eastern Europe; the Young Turk movement, which deposed Abdul Hamid in 1908; the loss of Tripoli after the disastrous war with Italy in 1911; and finally the war of the Balkan allies, which stripped Turkey of her land in Europe, save for Istanbul, Adrianople, and some surrounding districts.

During the World War Turkey at last sided with her former enemies, and came off with a crushing defeat. Though the nominal head of the church proclaimed a Holy War, the Arabian Mohammedans refused to follow, joined the allies against Turkey, wrested control from the Ottomans, and set up a new religious government of their own. By the treaty of 1920, Turkey lost Thrace, Smyrna, Cyprus and other islands, Egypt, Armenia, Mesopotamia, Syria, Palestine, and the Hejaz (now Saudi Arabia). When Mustafa Kemel Pasha (Kemel Ataturk) gained control in 1923, the capital became Angora in Asia Minor, the caliphate was abolished in Turkey, women were given rights like those in western nations, the Mohammedan law was changed for Roman and Swiss, and the western alphabet was adopted, along with the Gregorian calendar. Other signs of the modernizing of Turkey were the refusal to establish a state religion in 1928 and admission to the League of Nations in 1932.

TYLER, WAT (d. 1381). Leader of a workers' rebellion in England. Distress following the Black Death led both the craftsmen in towns and the peasants on farms to seek relief from taxes and other restrictions. In 1379 and 1381 a poll tax was imposed, and in May of 1381 riots broke out at various points. A mob in Kent chose Wat or Walter Tyler leader, seized the castle of Rochester, entered Canterbury, sacked the palace of the Archbishop, and then went on toward London. They burned the prison in Southwark, London, beheaded three "traitors," and rifled the residence of the archbishop at Lambeth. In a parley with Richard II, a boy of 14, the peasants demanded abolition of feudal services, taxes, and restrictions on labor. These demands were granted. The mob returned to the Tower in London, dragged out the Archbishop and Sir Robert Hales and put them to death on Tower Hill. London was plundered, and many were killed. Then the citizens rose up in defense. At another conference with Tyler, fresh demands were made and agreed to, but Tyler became abusive, and the mayor and a squire of the king killed him on the spot. This broke up the rebellion. Parliament in 1381 revoked the promises made by Richard, and little came of the movement.

TYRE. Famous ancient city of Phenicia, now in Great Lebanon, a mandate of France since 1920. The old city was largely on an island, to which a causeway had been built, and was an impregnable fortress. The name appears in the Tell el Amarna letters of the 14th century, and is mentioned along with Sidon in the Scriptures. Hiram, king of Tyre, visited and assisted Solomon in building the Temple. Both Assyria and Babylon tried to take the city. Shalmaneser, defeated in a sea attack, laid siege to Tyre for five years, and died before he took the town. Ashurbanipal in 664 B. C. took the city by storm, but Nebuchadrezzer for 13 years besieged it without success. The Seleucids took Tyre in 198 B. C., and the Romans in 68. St. Paul spent a week there on one of his journeys. In Roman times, it was the center of commerce and of the celebrated dye called "Tyrian purple"; also producer of some of the first silks known in western Asia. The Mohammedans took Syria, including Tyre, in the 7th

century, and the Crusaders made it an important part of their kingdom of Jerusalem.

UKRAINE. Ruthenians immigrated into the Ukraine from Poland and Lithuania, set up semi-independent communities, became known as Cossacks, and in 1667 came under sovereignty of Russia. Other portions were absorbed into Russia after the second division of Poland in 1793. By the middle of the 19th century, movements for national unity attained some strength. In the spring of 1917 a separate government was set up at Kiev, with the election of a *rada* or council. The Bolsheviks later objected, disorder followed, Germany and Austria sent forces to get food and to set up a government, after which Ukraine joined the West Ukraine republic. Two other governments followed, the White Russians tried to force the Bolsheviks out of the district, and finally in 1921 the Ukraine republic was recognized by Russia. Treaties were signed with various powers, in 1923 the Union of Socialistic Soviet republics came into being, with Ukraine a member, and in 1924 a Moldavian republic, as part of the Ukraine, was organized.

UNDERGROUND RAILROAD. This term came from the fact of the euphemistic use of railway terms like *lines, stations, freight, conductors* to apply to the elaborate system of getting slaves from the South to freedom in Canada. Branches ran from Kentucky and Virginia through Ohio, from Maryland across Pennsylvania and New York and New England. Anti-slavery advocates along the way gave shelter, food, and often transportation to negroes seeking escape from the rigors of the Fugitive Slave Law. Thomas Garrett and other Quakers of Pennsylvania, it is asserted, so helped 2700 slaves to escape to Canada. Old Harriet Tubman, a negress known as "General" to John Brown and as "Moses" to the slaves, went to the South, and helped some 200 or 300 to get away. Levi Coffin, who had lived in North Carolina, afterward moving to New Garden, Ohio, later to Cincinnati, was one of the "presidents" of the underground railway. Much of the work was carried on with the connivance, sometimes the assistance, of local officials; the *trains* ran mostly at night. Authorities tell us that between 25,000 and 100,000 negro slaves escaped to freedom by means of such assistance.

UNION LABOR. See *Trades Unions*.

UNION OF SOCIALISTIC SOVIET REPUBLICS. See *Soviets*.

URUGUAY. Between 1512 and 1625, various attempts by Spain to subdue the brave Charruas Indians of the Plata in South America, met with complete failure. When Philip III sent the Jesuits there, the missionaries succeeded where the military leaders had made no headway. At last in 1726 the Spanish set up a government at Buenos Aires, and in 1777 they drove out the Portuguese. After being ruled by Brazil and Buenos Aires after 1814, in 1828 Uruguay became independent, though Brazil claimed border lands until 1913. Struggles between leaders, factions, and with foreign powers prevented much progress until after 1880. Uruguay adopted a very progressive constitution in 1930, to replace that of 1830, with later revisions.

VALLEY FORGE. Village some 24 miles northwest of Philadelphia, where Washington and his army spent the winter of 1777-78. After the failure of the campaign in New Jersey, the troops were disheartened, greatly in need of supplies, and hardly fit for service. Baron Steuben, however, was able to reorganize the military discipline, and to make headway in all forms of military tactics. Yet the authorities in Washington failed to issue requisite supplies, and Washington himself almost gave up the struggle. At the time he wrote: "We have this day no less than 2875 men in camp unfit for duty because they are barefooted or otherwise naked. . . . Numbers are still obliged to sit all night by fires." On June 18, 1778, the army broke camp, recaptured Philadelphia from the British, and started on the second campaign in New Jersey. In 1893 Valley Forge became a state park.

VANDALS. Teutonic people who came from northeastern Germany and helped terminate the Roman empire. Under Aurelian, 271 A. D., the Vandals occupied one wing of the imperial army; and under Constantine I, eastern emperor, the Vandals settled in Pannonia about 330. This restless people two generations later began to swarm into Gaul, and then across the Pyrennes into Andalusia (from *Vandalusia*). Boniface, count of Africa, allowed them to come across the Mediterranean about 429, and here they mastered Carthage, and much of the northern shore. They plundered the neighboring lands, and Gaiseric or Genseric became the master of Rome in 455. He and his son Hunneric expelled the Christian bishops, but one of his successors, Hilderic (523-531), contrary to the promise he made the Vandals, restored them to their sees. Hilderic was cast into prison by his cousin, Gelimir, who usurped the throne, and sent his brother to conquer Sardinia. While the army was absent from Carthage, the eastern Roman empire sent Belisarius to Africa, 533, who defeated Gelimir, and ate the dinner the servants had prepared for Gelimir in his own palace. Gelimir graced the triumphal procession of Belisiarius at Constantinople, worn out and probably insane from his troubles, while he laughed and reviled his conqueror.

VATICAN CITY, STATE OF. For many centuries the Popes held territories called the Papal States in central Italy, but the last of these were incorporated into the new kingdom of Italy in 1871. Sovereignty of the Pope was thereby confined to the Vatican, other parts of Rome, and a villa some miles away; the Pope was guaranteed a grant annually of over $600,000 but this was never claimed or collected. Following negotiations long pending, the Italian government ratified the Lateran Treaty between the Vatican and Mussolini that was made Feb. 11, 1929. By this 108 acres were set up as Vatican City and State, with independence, but not necessarily political prestige, guaranteed. In 1935 the civil government of the Vatican was reorganized. Vatican City includes St. Peter's Church, the Museum (covering over 13 acres), the Palace and Vatican gardens, and neighboring buildings, but 13 others in different parts of Rome are included. Castle Ganfalco, 15 miles from Rome, is also Vatican property, and here the Pope established his summer residence in 1934.

VENEZUELA. In 1498, on his third voyage, Columbus touched on the shores of what is now Venezuela, the first of the South American mainland sighted by him. The Spanish ruled until the revolution of 1811, out of which the present Colombia, Venezuela, and Ecuador were organized into the Republic of Colombia, with the liberator, Gen. Simon Bolivar, as President. Venezuela belonged to this unit from 1819 to 1830 when a peaceful separation from Colombia occurred, though the bounds were not finally fixed until 1923. Gen. Paes ruled the country for 19 years, until driven out in 1845. Venezuela has seen turbulent periods, changes in the Constitution, and other troubles at home and abroad. For years the question of a strong central government, or a loose federation of states, was a dominant issue, until in 1864 a federal republic was constituted. For nearly 29 years, beginning in 1869, Antonio G. Blanco held chief sway, either as president or else the power behind the government. In 1895 Pres. Cleveland hinted to Congress that he might ask a declaration of war against Great Britain if a boundary dispute with Venezuela was not settled by Britain. Satisfactory abritration followed in 1899, as did another in 1907, when nearly $700,000 were awarded to France, Germany, and Italy because of acts during the term of Pres. Castro, 1900 to 1908. For 25 years Gen. Juan V. Gomez was president or majority leader. In 1929 he declined election, but in 1931 came back into power after the death of Pres. Perez. His administration spent over $80,000,000 for internal improvements. After his death in 1935, political uncertainty ensued.

VENICE. Known as the "Queen of the Adriatic," this Italian city on islands elected a doge in 697 to be supreme in church and state. For many years Genoa and Venice contended for supremacy in commerce, which at the end of the third war went to Venice when the rival fleet was beaten in 1579. After a long war with Milan, in 1454 the city was recognized as arbiter of Italian states. Next wars with Turkey and France added greater prestige, followed by an oligarchy and the start of the decline of Venice. Following another war with Turkey, Venice lost the Morea and Candia in 1718. In 1797 Napoleon picked a quarrel with the city, which offered little resistance, and from then to 1866 was in control either of France or Austria. In 1848 Daniele Manin led a revolt against Austria and became president of Venice, but in 1849 was forced

to flee. Manin and others in Paris, however, agitated in favor of a united Italy, which was at last accomplished in 1866.

VERDUN. Fortress city in eastern France attacked by the Germans in 1916. Bombarding the French positions from Malancourt to Abancourt, with terrific ferocity, the Germans later stormed Haumont Wood and Herbebois, while the French fell back to carefully prepared positions. For over a month the operations continued, leaving the French unbeaten in the end. During May the Germans attacked Le Mort Homme, Hill 304, the key to the defenses west of the Meuse River, these being finally reduced to submission. The great battle raged around Fort Vaux, which the French most ably defended, until the whole landscape was battered almost beyond recognition. In June the German offense continued, but whole divisions had to be withdrawn to check the British offensive on the Somme. The French commander, Gen. Nivelle, started a sudden counter stroke, which pushed the Germans back, and lost their hope of breaking the allies lines about Verdun. In October the Germans gave up Fort Vaux, and by the end of the year, the French were back about where the struggle started in February. The French admitted a loss of 350,000 men, and the Germans at least 330,000, with no great gains by either side.

VERSAILLES, TREATY OF. Following the efforts of Woodrow Wilson to end the World War, which at last bore fruit in the Armistice on November 11, 1918, diplomatists of the nations agreed to meet in France for a conference in January, 1919. The first session was held in Paris on January 18, when George Clemenceau explained the nature of the problems to be discussed at the conference of Versailles. Three types of governments were represented,—the large nations with general interests, some small nations with special interests, and all others that had severed diplomatic relations with Germany. The first class was given five delegates each; a few of the smaller ones, three, the rest of them, two, and all others concerned, one each. It was a diplomatic, not a parliamentary gathering, and no special constitution or mode of procedure was established. Though numerous difficulties followed no question ever rose as to the mode of procedure or the authority of the Versailles Conference.

Some of the main considerations were efforts to form an association of nations to take the place of the balance of power and old alliances in Europe; the question of punishment and reparations that Germany should pay; international labor questions; control over seaports; and economic cooperation among friendly nations. Deliberations were usually related to three great movements: a revolt against the old doctrine of a balance of power among nations; a horror of the awful havoc wrought by the war; and a zeal to form a league of governments. President Wilson had enunciated 14 "Points" for the ending of hostilities. In a broad way the statesmen at Versailles seemed to approve of these early in the Peace Conference.

Yet in practice it was hard to get away from national ambitions of long standing. Wilson was often looked upon as an impractical dreamer or a meddler in affairs beyond his own national borders or a professor who did not understand European diplomacy and ideals. At various points old rivalries, ambitions, and personalities clashed and all but wrecked the conference. Once President Wilson brought action by hinting that he was returning to America at once. The Italian delegation actually withdrew for weeks, and Japan assumed an offish attitude very early. In both France and America attempts were made to scuttle the plans for the League of Nations after they had been formulated and promulgated. France wanted the coal lands of the Saar Valley; Italy, after resigning claims to Croatia, came back with demands for Fiume, and the poet D'Annunzio actually gained possession with a force of Italians at his call; Japan wanted a hold in Shantung, which had been reclaimed by her from German interests; and all the concerned powers wanted slices of the German colonies. In the end France allowed a postponement of the claims to the Saar, which by plebiscite finally went back to Germany. Other demands were relaxed or compensated for, and mandates for former German and Turkish territory were arranged instead of partition. See articles on League of Nations, Mandates, World War.

VICKSBURG. During the Civil War, General Grant spent much time in 1862 and 1863 planning the capture of Vicksburg, Miss., a stronghold that commanded navigation on the Mississippi. After repeated failures, Grant called for more troops from the North. With careful preparations in advance, cutting off every means of escape from the area, he bombarded Vicksburg from Federal ships for six weeks. Much damage resulted from exploding shells. At last the inhabitants were worn out from anxiety, lack of food, and poor sanitation. On July 3, 1863 the Confederates capitulated. The northern forces took 37,000 prisoners, 172 cannon, and about 60,000 muskets.

VIENNA, CONGRESS OF. Gathering of kings and diplomatists at Vienna from Sept. 1814 to June 1815, to rearrange the affairs of Europe after the downfall of Napoleon. Czar Alexander of Russia, a liberal and democratic man, among the kings, led in the discussions. The emperor of Austria, kings of Prussia, Denmark, Bavaria, and many princes of smaller states also joined in the Congress. Of the ministers there, Prince Metternich of Austria and Talleyrand of France were also outstanding, along with Castlereagh and Wellington of England, Humboldt of Prussia, and Nesselrode of Russia. Some of the main results were these: union of Holland and Belgium as a buffer state; union of Norway and Sweden under Bernadotte, a general of Napoleon; guarantee of the neutrality of Switzerland; award of most of Warsaw to Russia, west Prussia, Posen, and part of Saxony, to Germany, territory recently lost given back to Austria, with other awards to make up for the loss of Belgium, and Cape Colony, Ceylon, Mauritius, and Malta to England. The Congress condemned the slave trade, and provided for freedom for navigation of streams between states or crossing several countries. Though the Congress failed in some respects, the same as the Peace Conference in 1919 at Versailles, the peace of Europe was maintained for about 50 years by these arrangements.

VIMY RIDGE. Important position north of the River Sharpe and 10 miles from Arras, France; of great strategic value because it overlooks the country about Lens, Douay, and far beyond past Lille into the Low Countries. The French captured the position from the Germans, and also Hill 140 in 1915; but counter attacks drove them back two miles upon Neuville. In 1916 the British twice captured Vimy, but lost it again in desperate encounters. In the third battle of Arras, described elsewhere, in April 1917, the Canadians took Vimy in forty minutes under the cover of an artillery barrage. One week before this, the United States had declared war against the central powers. In consequence of our joining the allies, though no Americans had entered officially as yet, William Clancy of Texas (who was with the British infantry) carried the Stars and Stripes in the battle of Vimy Ridge.

WALDENSES. Pater Waldo of Lyons, France, in 1170 sold off all his goods, gave the proceeds to the poor, and went out as a preacher of voluntary poverty. He translated the Scriptures into Provençal, sought to explain them according to primitive doctrines of Christianity, and soon gathered numerous followers in the valleys of Piedmont. In later times they came to be known as Vaudois. Pope Alexander III favored their doctrine of poverty, but forbade them to preach without permission of local bishops. Waldo replied that he must follow the command of God, and Lucius III excommunicated him in 1184. By 1250 the chief doctrines were that oaths were forbidden by the Bible, that the state has no right to put people to death, and that any layman could consecrate the sacrament. They gradually broke with the church, suffering in consequence bitter persecution. Little settlements spread out, kept to themselves, and refused all offers of reconciliation. In 1487 a force sent against them was dispersed in a fog with great slaughter. Charles II of Piedmont offered the Waldenses some protection. They joined the later protestant movements in both France and Italy. In 1650 a new persecution reduced their numbers by a horrible massacre, against which Cromwell of England protested, and John Milton wrote his famous sonnet. Subsequent campaigns against them in their mountain valleys never succeeded in wholly crushing their spirit.

WALES. Since 1536 this land to the west has been administered as part of England, and forms with England, Scotland, and Ireland, the United Kingdom of Great Britain and North Ireland. The earliest inhabitants, thought to be of non-Caucasian race, were succeeded by the Brythonic Celts or Cymri. The Saxon invasion drove many of the latter stock

from England proper into Wales. Before this time, when the Romans came to Britain, the Welsh seem to have been a mixture of Iberians, the primitive stock, and later Celts. King Harold in 1064 began the final subjugation of Wales, completed by the Norman kings, who erected castles on the borders and gave feudal chiefs of the west much control over the Welsh. From 1136 to 1284, all the kings had trouble keeping the Welsh loyalty. Lewellan, Prince of North Wales, after years of hesitation, rebelled and perished in 1282, as did his successor, David. Edward I, in 1301, gave his son, who had been born in Wales, the title of Prince of Wales, which has since then been given to the eldest son of a reigning king or to the heir apparent to the British crown. When Henry IV took the English throne in 1399, troubles in Scotland kept him busy for two or three years, during which the Welsh, led by Owen Glendower, revolted. Henry invaded Wales several times. When Wales was incorporated with England in 1536, the Welsh received all rights and honors of English subjects.

WALLACE, WILLIAM (c. 1270-1305). National hero of Scotland, born in Renfrewshire, who gathered a force against the English, after he had been outlawed. Many prominent men joined his cause, but all except Sir Andrew Moray deserted, when the English sent Sir Henry Percy and Sir Robert Clifford against the rebels. In the north of Scotland, Wallace soon collected a large force, took most of the points held by the English north of the Forth, and laid siege against Dundee. When a force came into Scotland, Wallace quickly led his men to Stirling, where he guarded the passage of the Forth. After a fruitless parley, the English advanced across the bridge over the Forth, but Wallace fell on them when hardly half had crossed, killed many, and the rest were drowned in trying to flee. The Scots passed over the ford, pursued the troops that had not yet crossed, and drove them to Berwick. Wallace next organized a raid into northern England, was chosen guardian of Scotland, and did much to bring order in the North. Edward I defeated him at Falkirk in 1298, after which Wallace may have been in France to obtain aid, but he was excepted from pardon by the English. On Aug. 5, 1305 he was captured near Glasgow, taken to England, hastily tried, condemned, and executed the same day in a most barbaric manner.

WARREN, JOSEPH. American patriot, born in Boston, and educated at Harvard and in Boston to be a doctor. When the British passed the Stamp Act, Warren joined with John and Samuel Adams and others in organizing a popular party in Massachusetts. The result was the famous Suffolk Resolves, as they were called, drafted by Warren, and calling on the people to resist British aggression by force if need arose. Warren sat in the first three provincial congresses (1774-75), became president of the third, and was on the committee of public safety. He was appointed a major general, but three days later acted as a volunteer in the Battle of Bunker Hill (June 17, 1775), before his official commission had been received, and was wounded fatally on that day.

WARSAW. No town in Europe has suffered more changes of political control than has Warsaw. Mentioned in authentic history first in 1224, the town was until 1526 the seat of the counts of Mezovia, then was annexed to Poland, with Warsaw later as capital of the union of Poland and Lithuania. Some of the subsequent changes were—taken for a year by Sweden in 1665; by the Poles again until Charles of Sweden assumed charge in 1702; again free the following year; taken by the Russians in 1764, who put Poniatowski on the throne; taken by Russians again, 1794; by Napoleon, 1806; capital of duchy of Warsaw, 1807; taken by Austria in 1809; then free again, until Russia returned in 1813; taken by a revolution in 1831; 1915 occupied by the Germans; and since 1918 free once more. After the disorders of 1831, 1863, 1905-06, restrictions, banishments, executions, and needless bloodshed caused the Poles to look forward to freedom from Russian domination. Even after the World War, Poland and Warsaw were scenes of much disorder and uncertainty of allegiance. Warsaw is noted for its great botanical gardens, magnificent library (these two parts of the University of Warsaw), a remarkable theater building, erected in 1767-88, royal castle dating to early days, notable picture galleries and museums, and many fine villas.

WARWICK, RICHARD NEVILLE (1428-1471). Earl of Warwick and called "the king-maker," was born Richard Neville, married the daughter of Richard Beauchamp, Earl of Warwick, who brought him a title and estates. After becoming a member of the king's council in 1453, he gained much fame as champion of the Yorkists against the house of Lancaster in the civil wars. After the Lancastrians won two important victories, Warwick met Edward of York in Oxfordshire, had him brought to London, and proclaimed him king in place of Henry VI. After the battle of Towton, Warwick and his party continued powerful for four years, but, when the king married secretly instead of accepting the French match proposed, Warwick began to lose his hold on Edward IV. Because of further slights from Edward, Warwick entered into secret negotiations with the Lancastrian Queen, Margaret of Anjou, who had fled to France. With the duke of Clarence, brother to the king, Warwick returned to England in secret, restored Henry VI, and ruled for him for the next six months. The Lancastrians, however, did not relish this restoration. In March 1471, when Edward returned from France, they rallied to his support, fought the forces of Warwick at Barnet, and Warwick was slain. One of his daughters, after his death, married the duke of Gloucester, who later ruled as Richard III.

WATERLOO. Here at a small village some 12 miles south of Brussels, Wellington, commander of the allies against Napoleon, chose to take a stand to prevent the French from capturing the Belgian capital. The French had about 125,000 men, commanded by Marshal Ney, Gen. Grouchy, and Napoleon himself, taking the left, right, and center respectively. The Prussian allies under Blücher included about 120,000 Prussians; Wellington had a mixed force of over 90,000. Napoleon's plan was to beat the allied forces before they could concentrate and help each other. In this he utterly failed. Blücher fell back toward Wavre. Napoleon sent Grouchy with 30,000 to pursue him, a move that was most costly. Wellington stood his ground for battle on June 18, 1815, having halted from a retreat. For nine hours the British and allies were subjected to a terrific artillery, infantry, and cavalry attack. Late in the afternoon, the allies were pushing the French slowly backward, when the Prussians under Blücher arrived in time to render effective aid. Some of the reasons for the defeat of Napoleon were these: his bad choice of commanders under him; failure of his cavalry against a solid square of British and allied infantry; able support of Wellington by the Prussian forces under Pirch and Zieten; failure of Napoleon's Old Guard, which were finally driven back in a disorderly retreat. The French lost some 40,000 men and most of their artillery; Wellington about 15,000, and the Prussians, 7,000; the Dutch fewer. Some 45,000 dead and wounded were heaped on a field not more than three miles square. Napoleon later blamed Grouchy for the defeat, but his own plans, according to military authorities, fell far short of his former skill in strategy.

WELLINGTON, ARTHUR WELESLEY, FIRST DUKE OF (1769-1852). In 1798 he changed his name from Wesley. He saw service in Holland and India, having joined the forces in 1787, but failed to gain any special notice before 1803. For several months in 1807, he acted as Irish Secretary, then helped drive the Danes out of Zealand, and returned to his post in Ireland. In July 1808 he went to Portugal for the so-called Peninsular Campaign, and defeated the French at once in two battles. From then to 1814 he gained brilliant successes against all the men and generals sent out by Napoleon against him, for which he was made a field marshal, Marquis of Duoro, and given a present of about $2,000,000. Later he was created a duke. After the return of Napoleon from Elba, the army of the British and Prussians in Belgium was placed in charge of Wellington and Blücher. Waterloo followed and sealed the fate of Napoleon forever. In August 1827 he became prime minister, helped secure Catholic emancipation, but failed to recognize the importance of the Reform Bill offered in 1830. His government fell and he became so unpopular that a mob hooted him in the street. When William IV again urged him to form a government, he had Peel appointed prime minister and served for him for three months until Peel returned from Italy. Wellington then and later was foreign secretary. In 1842 he was designated as commander of the army for life.

WEST POINT. Familiar name for the United States Miliary Academy at West Point, 28 miles north of the City of New York along the Hudson River. It was a strategic post during the Revolution, and here Kosciusco, the Polish patriot, helped erect defenses and train the soldiers. Washington urged that a school for military training be established here. In a reservation of about 2000 acres, increased in 1875, the first school was started in 1790, but suspended when the building burned in 1795. West Point was again established in 1801, reorganized in 1812, and placed on something like its present footing in 1817 when Major Thayer of the Engineering Corps became superintendent. New buildings have been erected some 180 feet above the river, in a position to command a view of the Hudson for miles up and downstream.

WHIGS. Along with the name Tory, a term of reproach at first, Whig came from *Whiggamore*, a name for Presbyterians in rural Scotland. Hence, it meant no more than a Scots rebel; whereas Tory came from a word for robber, and was used of the Irish chieftains. At first the Tories were supposed to favor restoration of a Catholic king. Later Tories supported the king and tradition; the Whigs favored more democratic and popular government. In 1832, during the days following the passing of the Reform Bill in England, the names ceased to have any particular significance. In time Whigs became Liberals, while Tories were considered to be Conservatives. In the Colonies, the Whigs were those who opposed British rule; the Tories, those who favored the mother land. In 1839 the Whigs, then the remnant of the old National Republicans, elected Harrison for president, with Tyler for vice president, but the latter embittered the Whigs after Harrison's death because of his opposition to the national bank. Taylor was elected on a Whig platform in 1848. In the intervening election, Clay was nominated by the Whigs on a platform of national regulation of currency, tariff for revenue, single term for president, and other progressive ideas. By 1854 the Whigs as a party died out, being followed by the Republicans, after the disputes over the Kansas-Nebraska Bill.

WHITE, PEREGRINE (1620-1704). First native born child of European parents of proved ancestry in New England. His birth occurred on the *Mayflower* while she lay at anchor in Cape Cod harbor in Nov. 1620. Plymouth Colony gave him 200 acres of land near the present Marshfield, Mass., and he received other grants later, and considerable property from the family of Sarah Bassett, his wife. William White, father of Peregrine, died at Plymouth in the first winter, and Susannah Fuller, his widow, married Edward Winslow, who later became governor. She was the first widow, the first bride, wife of one governor, and mother of another of Plymouth Colony, since her son, Josiah Winslow, was the first native-born governor. The Winslows lived at Green Harbor, now near Marshfield, and here Peregrine White spent much of his life. He was active in the contests with the Indians, held some minor offices, and was known as a capable man. Resolved White, his elder brother, who was born in Leyden, Holland, in 1614, married into the notable Vassall family, and late in life settled near his brother, Peregrine. The White burial plot at Marshfield is a few hundred feet from that of Daniel Webster.

WILLIAMS, ROGER (c. 1604-1684). Pioneer in America of religious toleration and founder of the colony of Rhode Island. Williams was of Welsh ancestry, probably born in London, and was a graduate of Pembroke College, Cambridge. He refused to settle as a minister, came to Boston, then taught and preached at Salem, for two years at Plymouth, and then again at Salem. In July 1635 the Massachusetts Court tried Williams (for his opinions on civil affairs, not theology), and banished him from the colony. He delayed, escaped arrest by fleeing to Plymouth, and finally went to what is now Providence, and established a settlement. Williams bought land of the Indians, became a Baptist, but withdrew in a few months to become a "Seeker" or Independent. He obtained a charter for Rhode Island in 1644, was president (or governor), 1654-57, and assistant at other times. In 1654 he went to England to obtain an improved charter, and here knew Cromwell, Milton, and other Puritan leaders. Williams wrote some vigorous controversial pamphlets.

WILLIAMSBURG, VIRGINIA. City in Virginia of many historic associations, situated between the James and York Rivers, 45 miles southeast of Richmond. Founded in 1632 as Middle Plantations, this village became the state capital from 1699 to 1779. Here in 1693 William and Mary College was founded, second oldest after Harvard in the United States. Bruton parish church, finished in 1717, and restored in 1907, is the oldest church building in the country in continuous use. The powder house dating from 1714, the court house, 1769, the houses where Washington had his headquarters, are all preserved and restored. Here in 1736, the *Virginia Gazette* was established, first newspaper in the South. Patrick Henry made his speech against the Stamp Act, 1776, and the Convention declared for independence, in Williamsburg. Following plans of Rev. W. A. R. Goodwin, old Bruton church was restored, and a fund was raised (to which John D. Rockefeller Jr. gave $5,000,000) for restoring over 100 buildings to their original forms, for removing about 100 modern structures, and for making old Williamsburg a shrine of colonial relics. Phi Beta Kappa, national scholastic honor fraternity, was founded in 1776 at William and Mary College.

WILSON, HENRY BRAID (1861-). Naval officer, after graduating from the U. S. Naval Academy in 1881 became an ensign and rose to the rank of rear admiral in 1917, vice admiral in 1918, and admiral 1919. During the Spanish-American War, he was on the Bancroft; on duty in the Bureau of Navigation from 1904 to 1908; commanded the Chester, 1908-10; assistant in charge of Bureau of Navigation, 1910-11; commanded the North Dakota, 1911-13, the Pennsylvania, 1916-17, commander of the Patrol Force of the Atlantic Fleet, 1917-1918; commander of the U. S. Naval Forces in France, 1918 and of the Atlantic Fleet, 1919. Admiral Wilson was Superintendent of the Naval Academy, Annapolis, from July 5th, 1921 to his retirement from active duty in February, 1925.

WOLFE, JAMES (1727-1759). British army man who led in the capture of Quebec from the French in 1759. He entered the British army at 15, soon distinguished himself, and from 1749 to 1757 served in Scotland and then was with the expedition against Rochefort. Under Lord Amherst he served as a brigadier at Cape Breton, the first attack on Quebec, and in the siege of Louisburg. The British ministry chose him to renew the attempt to capture Quebec, for which purpose he collected some 9000 men at Louisburg in April 1759. The expedition was safely conveyed to Quebec by Admiral Saunders in June. The first assault failed. Wolfe, on advice from his officers, then chose to land a small force down stream, while a large party proceeded to land above the city. So, while Montcalm, the French commander, sent his men to forestall the landing party below Quebec, the larger force carried the day with little effort. Just as the French lines were falling back, Wolfe died of a wound from a musket ball. Montcalm the next day was also killed. The two commanders were buried with all honors of war, and a monument was erected to their memory at Quebec.

WOOD, LEONARD (1860-1927). In 1886 Wood became assistant sugeon general of the United States army. Acting as colonel, with Theodore Roosevelt as lieutenant colonel, he organized the first U. S. volunteer cavalry, commonly known as the Rough Riders, and saw service in Cuba in the battles about Santiago, of which city he served as military governor, and later governor of Cuba (1899-1902). In 1903 he became major general of the regular army, after which he served in the Philippines until 1908. In the following year he became chief of staff of the army, commanded the department of the East during the World War, and did much to train various detachments of soldiers. From 1917 he was governor of the Philippines, where he instituted many reforms and economies in administration.

WOMAN SUFFRAGE. Out of the anti-slavery movement in both America and England, the cry of "votes for women" arose. The ladies complained that they could not vote, speak in meetings, or take any part in the deliberations on important social matters. In 1840 women delegates were refused seats in a convention in England. Eight years later, Elizabeth Cady Stanton, Susan B. Anthony, and Lucretia Mott, called a convention at Seneca Falls, N. Y. and this initiated the definite movement for suffrage for women. The World War hastened the advance of this movement; for in 1914 only four

European governments allowed women to vote at all; in 1918 Austria, Canada, Czechoslovakia, Denmark, Finland, Germany, Holland, Hungary, Iceland, Ireland, Norway, Poland, Serbia, Sweden, and Great Britain had given women rights to vote in all or in some elections. Other countries followed suit in their constitutions after the World War. In 1928 complete franchise was granted women in the United Kingdom; in 1931 Spain gave them the vote; and in Europe only France and Switzerland held back. On Aug. 18, 1920, the Secretary of State at Washington proclaimed then in effect the XIX amendment to the Constitution granting suffrage to women. Only three states refused to concur—Alabama, Maryland, Virginia.

WORLD COURT. This is the more familiar name for the Permanent Court of International Justice, organized under Article 14 of the Covenant of the League of Nations, and established in the Carnegie Peace Palace at the Hague, Holland. The first session was held there on Feb. 15, 1922, with J. C. Loder of Holland as the presiding judge. Though the United States has never adhered to the provisions of the Court, three citizens have been appointed judges,—John Bassett Moore, who served until 1928, Charles Evans Hughes, who resigned to become Chief Justice of the United States Supreme Court, and Frank B. Kellogg, formerly Secretary of State. Judges are chosen for nine years, with a definite scheme of rotation, and in 1931 the number was raised from nine to 15. About 50 nations have signed the agreements for a Court, which provides for both voluntary and compulsory jurisdictions. Modifications were made to make it easier for the United States to join, and Presidents Hoover and Roosevelt so advised. On Jan. 29, 1935, the United States Senate voted in favor of adherence, 52 to 36, but the resolution failed for want of a two-thirds majority as required.

Cases are submitted to the World Court in several manners, mainly by one party to a dispute, by agreement of both, by the Council of the League of Nations, and by a third party or more. Judgments, advisory opinions, and orders are issued by the justices. In the first nine years, during 18 sessions, there were 16 judgments and also 16 other decisions. As a case submitted by the nations might be cited the litigation before the Court as to the steamship *Wimbleton*, which the Germans refused passage through the Kiel Canal, because it was a British ship loaded with munitions from a French company for use in Poland. Britain, France, Italy, and Japan, with Poland later, brought suit as to the rights of Germany to take such action. An example of an agreement of opinion of the Court was that of the arrest by Turkey of an officer of a French mail-ship which had collided with a Turkish collier. The World Court advised that Turkey had jurisdiction, which was disputed by France. Such decisions have already been taken, in several instances, with the same force as official judgments. An example of a court order concerns the confiscation of a German-owned nitrate factory in Poland. The parties to the dispute filed an agreement with the Court, and an order was issued terminating the litigation. The League Council has originated cases like those as to German colonists in Polish territory, whose rights were infringed, the status of the City of Danzig; and the boundary of the Mosul oil fields in Asia. Third parties have originated suits like those as to the exchange of Greek and Turkish populations; the status of the International Labor Office as defined by the Versailles Treaty; and the nationality of residents in Tunis and Morocco. See articles on *Hague* and *League of Nations*.

WYOMING MASSACRE. The fertile Wyoming Valley now in Luzerne Co., Pa., according to conflicting Indian grants, was claimed by Connecticut and Pennsylvania. In 1771 the British king confirmed the grant to the original Connecticut Company given the rights by the Indians in 1754. After a local disturbance in 1775, some Tories were expelled from the township set up in 1773. These, with about 300 British and 700 Indians, returned, and were about to storm a fort where the inhabitants had taken refuge. Some 400 of the defenders of the valley attacked the invading party on July 3, 1778. Two-thirds of the attacking party were killed or captured, and about 100 women perished in trying to reach the nearest settlement. Congress awarded the land to Pennsylvania in 1782, and the state accepted the grant in 1788.

XENOPHON (*c.* 430-*c.* 355 B. C.) Known in literature as the author of the *Anabasis* and of histories, but in his time better regarded as the man who led the retreat of the 10,000 Greeks on their return from central Asia after serving in the Persian wars. Though he went with the Greek mercenaries as an historian, on the death of the leader, Proxenus, the Greeks called on him to be their general in the hazardous trip across mountains and through hostile countries. The journey of 1500 miles was accomplished in five months, with little loss of life, and the band reached Scutari opposite Byzantium in 399. Three years later Xenophon was one of the leaders in the expedition of Aegesilaus, king of Sparta, against the allies of Athens, Corinth, and Thebes. Athens lifted the ban of exile against Xenophon, but he did not return, and evidently spent his last years at Corinth.

XERXES (485-465 B. C.) Great Persian king, whose father Darius left to him the task of punishing the Greeks for aid they had given in the Ionian campaign against Darius. He collected a prodigious army, built a canal across Mt. Athos to get at the Greeks better, and stretched two bridges of boats across the Hellespont, a mile in extent, for his hosts to cross. Leonidas of Sparta, with a small band of allies, withstood the Persian hordes at the pass of Thermopylae, but Xerxes at last conquered and annihilated them through treachery of a Greek. Xerxes burned Athens, won some other successes on land and sea, but at last was humbled in the naval battle at Salamis in 480. Then he withdrew into Asia, leaving some of his army under command of Mardonius, who was beaten in the battle of Platea in 479. Little is known of the last years of Xerxes; some say he was assassinated in the midst of court intrigues.

X Y Z CORRESPONDENCE. During the days of the Directory in France, hundreds of American merchant vessels were stopped and searched on the high seas. At last President Adams sent three commissioners to negotiate a settlement in France. These men were C. C. Pinckney, John Marshall, and Elbridge Gerry. When the French commissioners demanded a large loan from the United States, the Americans refused and eventually returned home. Their report to Congress aroused such resentment that hostilities actually began on the sea. The three French negotiators were designated under the letters X, Y, and Z in the report to Congress; hence the term X Y Z Correspondence. When Napoleon came to power in 1800, the matter was peacefully adjusted.

YORKTOWN. Scene in Virginia of the last real battle of the Revolution, and the surrender of Lord Cornwallis, British commander. With about 1500 men the British had returned from the Carolinas, where Gen. Greene had checked them at every turn. Cornwallis attempted to prevent the union of the forces of Gen. Lafayette and Anthony Wayne. Washington, then in the north, held a conference with his advisors, including the French, at Wethersfield, Conn. As a result it was decided to concentrate the attack on the British about Williamsburg, Virginia. Meanwhile, the large French fleet under Admiral De Grasse proceeded to the Chesapeake. The two British fleets—one had come from the West Indies—were defeated by the French. Washington hastened to transport his forces to Virginia, and Cornwallis withdrew from Williamsburg to Yorktown. The American allies numbered about 16,000. They entrenched in two lines before Yorktown; and Cornwallis tried to escape, but a storm prevented his crossing the York River. He offered to surrender on Oct. 17, 1781, and two days later his whole army of 7073 men laid down their arms. The British lost 156 killed and 326 wounded; the Americans, 85 killed and 109 wounded.

YPRES. German troops occupied this city in Belgium on Oct. 3, 1914, but the allies retook it ten days later, and held on throughout the World War. Yet the city was battered into ruins, including the magnificent Cloth Hall, completed in 1342; the Gothic cathedral, dating from the 13th century; the town hall, with rare paintings; and the church of St. Peter, dating from the 11th century. The remnants of the Cloth Hall are now preserved as a memorial, but the Cathedral has been rebuilt. The first battle of Ypres, lasting for 27 days from Oct. 19, 1914, cost the allies 100,000 men, and the Germans even more, but the allied line held at the end, after losses and gains at intervals on both sides.

On April 22, 1915, the second battle of Ypres opened with the first use of chlorine gas, while the colored French colonials gave way, and the Canadians took their places. The Germans pushed the allied line back and back toward Ypres, but at last a method was found to counteract the gas, and the Canadians saved the lines for the allies armies. The third battle of Ypres, fought in the mud, August to November 1917, ended with gains by the allies, but with losses far greater than the small results warranted. The fourth battle of Ypres, from April 7, 1918, netted the Germans many advantages, but failed at last to flatten out the salient about Ypres, while Gen. Haig, for the British, asked the lines to hold, no matter what happened. All four battles, without significant results for either side, at least prevented the Germans from a general advance.

YUAN SHIH-K'AI (1859-1916). First president of China and the last of the elder regime of the old empire. Yuan belonged to the landed gentry, served in Korea, opposed Japan, and built up an efficient army. He assisted in the events which removed the emperor from the throne when the latter sought to subdue the empress dowager in 1898. In return he was made governor of Shantung, held his province firm during the Boxer uprising, became viceroy of Chihli, and rose to great power while he raised and trained six divisions of troops. Prince Chun, after the death of the former emperor, had Yuan deprived of office, but the revolution of 1911 saw him again in power, while he sought to preserve the monarchy. The southern revolutionists, led by Sun-Yat-Sen, encouraged him to become a candidate for the presidency of the new China. He assumed office on March 12, 1911, one month after the abdication of the Manchus who had ruled China for many centuries. In 1913 Sun-Yat-Sen and others tried to dethrone him, but the Canton revolution was short-lived. While Japan was making demands upon China, in 1915 the adherents of Yuan gradually fomented sentiment for restoration of the monarchy. The provinces voted concurrence, and Yuan prepared to ascend the throne on Feb. 9, 1916. Japan, Great Britain, and Russia secured a postponement of the plans, and several provinces rose in insurrection. In April Yuan gave up to a cabinet most of his powers, and so ended the old order in China on June 6, 1916 when Yuan died.

YUGOSLAVIA. This new kingdom in Europe was created on Dec. 29, 1918 out of the old Serbia, Montenegro, Bosnia, Herzegovina, Croatia, Slavonia, and some other small districts that once belonged to the empire of Austria Hungary. Until 1929 it was officially called the Kingdom of the Serbs, Croats, and Slovenes. Croatia and Slovenia declared independence when Austria-Hungary broke up in November 1918. Representatives from Bosnia and Herzegovina were admitted to the National Council, and later Serbia joined with the new government. Thus the dream of years for a Slav state was at last realized. Italy refused consent, however, until the city and district about Fiumé were given to her. Croatia from the start felt that the Serbs obtained too great control in the government. The dispute came to a head in June 1928, when five Croat deputies were shot down in the national assembly, two of them being fatally hurt. King Alexander I, who was crowned in 1918, abolished the parliament early in 1929, suspended the constitution, and in 1930 the 33 provinces of the kingdom were divided into nine banats or large divisions and the federal district of Belgrade. He ended his dictatorship on Sept. 3, 1931, with the promulgation of a new constitution, setting up two houses of parliament to replace the single one, universal privileges and voting, freedom of the press and courts, and more autonomy for the local units or banats. Though given more voice in affairs, Croatia still demanded a separate parliament for local legislation. King Alexander was assassinated in 1934, and his son Peter, a lad of 11, began to rule through a regency of three named in Alexander's will.

YUKON (Gold Fields). Gold was found on the Yukon as early as 1862, but it was not until 1886 that the discovery of rich gold placers along the upper Yukon at Forty Mile Creek, followed by further explorations in the other streams of the Yukon basin, led to productive workings. In 1896 a rich placer claim was located on a tributary of the Klondike river, which joins the Yukon just above the American boundary. By 1898 there had been an immigration of between 30,000 and 40,000 people. No such stampede of miners has occurred since the migration of the "Forty-Niners" to California. Dawson, the capital of the Yukon territory, in 1901 had over 27,000 inhabitants; in 1921, it had but 4200. As gold production in the region declined, the residents turned more to raising rye, barley, and various garden crops in the short summer.

ZIONIST MOVEMENT. When the persecutions of the Jews in Russia increased after 1880, suggestion was made that they emigrate to Palestine. In 1898, some 25 colonies had been established there, and in 1915, the number was 40. In 1886 Dr. Theodore Herzl proposed that Palestine be purchased of Turkey, and an autonomous state be created. So began the Zionist movement. The first Congress at Basel in 1897 announced that the purpose was to establish, by legal means, and by purchase, a home for Jews in Palestine. In 1914 the Jewish population in that land was about 100,000, but commenced to decline. The British in 1917 favored a Jewish state, and the Zionist Congress held at London in 1920 again made plans for settlement of Palestine with refugees from other districts. Both the San Remo conference in 1922 and the League of Nations also sanctioned the movement. On Sept. 29, 1923 the British obtained a mandate over Palestine. Immigration declined after 1930 when announcement was made that little arable land remained available. Yet several Jewish towns, like Tel Aviv, which grew from 46,000 in 1931 to about 85,000 in 1934, continued to increase.

ZISKA, JOHN (1360-1424). Bohemian leader of the Hussites in their struggles for religious liberty. Ziska served against the Poles with the Teutonic Knights at Tannenberg in 1410, with the English against the French at Agincourt in 1515, and joined the popular party against Emperor Sigismund of Germany. The Protestants captured Prague in 1421, erected fortresses, the main one being on Mount Tabor, hence the name Taborites for the followers of Ziska, and during the same year defeated Sigismund in twelve major battles, with only one loss. In 1422 the Hussites drove into Moravia the second army of the Germans under Sigismund; again at Aussia they gained a great success in 1423. During these campaigns Ziska was totally blind. Sigismund granted religious toleration in 1423, but did not gain complete control in Bohemia until 1436.

ZUYDER ZEE. Once a great fresh-water lake in Holland, until the North Sea gradually broke through between 1219 and 1287. Portions have been reclaimed from time to time. The area in 1920 was about 2000 square miles—44 miles long by 20 wide—and the water ranged from 12 to 19 feet deep. Plans laid in 1918 for draining much of the area, perhaps fully half, in 1924 were started by the building of a small dam. A much larger one is planned at a cost of about $40,000,000. The entire project, taking over 25 years to complete, includes a proposed outlay of nearly $200,000,000.

ZWIN'GLI, ULRICH (1484-1531). Swiss reformer, who was born at Wildhaus in St. Gall, and was educated at Bern, Vienna, and Basel. In 1506 he became parish priest at Glarus, six years later became chaplain to some mercenaries on foreign service, but objected to this, and settled at Zürich in 1518. Two years later he issued an appreciation of Luther, after which his religious and political influence was great. He prevented the canton from joining with France in 1521, secured the adoption of Reformation idea at Zürich, debated in public against other churchmen, and led in opposing the German Protestant Party. In the war of Zürich and Berne against the papal cantons, Zwin'gli joined, but perished in the battle of Cappel in 1531, when the reformed cantons were defeated. His main difference with Luther was over the Lord's Supper, which Zwin'gli insisted was not a repetition in each celebration of the sacrifice of Christ, but instead a memorial that this sacrifice was made once for all. He also broke more sharply with the old medieval church. On the spot where he fell is a boulder monument, inscribed with part of his last words: "They may kill the body, but not the soul."

THE IMPORTANT WARS OF HISTORY.

NOTE.— The first named of the contestants, the battles won by them, and the generals connected with that side are put in **bold face.**

Name and Dates, B. C.	Contestants.	Cause or Pretext for War.	Notable Battles and Incidents of War.	Leaders.	Results and Treaties.
Trojan, 1193-1184.	**Greeks,** Trojans.	Greeks avenge the carrying off of Helen by Paris.	**Siege of Troy.**	**Agamemnon,** Hector.	Troy captured and destroyed.
st Messe-an, 743-724.	**Spartans,** Messenians.	Spartans covet the rich land of the neighboring Messenians.	**Siege of Ithome.**	Aristodemus.	Messenians became tributary to Sparta and part of their land confiscated.
cond Mes-ian, 645-628.	**Spartans,** Messenians.	Messenians revolt from Spartan oppression.	**Ira, Zancle.** (See Messina.)	Aristomenes.	Messenians who had not fled to Sicily or elsewhere became Helots.
st Sacred or Holy, 600-590.	**Amphictyonic League,** Cirrhæans.	People of the city of Cirrha on Bay of Corinth covet the wealth of Delphi.	**Siege of Cirrha** and **Crisa.**	**Clisthenes.**	Greek cities, for the first time joined in effective league, save Delphi from spoliation. Cirrha is consecrated to Delphi.
ersian-Gre-n, 500-479. First Per-n Expedi-n, 493.)	**Persians,** Macedonians, Thracians.	Darius seeks to avenge burning of Sardis by Greeks when aiding revolt of Ionic Greek cities (500-494).	Persians are harassed on land by Thracians and lose 300 ships by storm off Mt. Athos.	**Mardonius.**	Expedition returns to Persia getting no farther than Thrace.
. Second rsian Ex-ition, 490.)	**Persians,** Greeks.	Previous failure.	**Naxos, Eretria,** Marathon (490).	**Datis, Artaphernes,** Miltiades (Athens).	Complete victory for the Athenians and retreat of Persians to Asia Minor.
I. Third sian Ex-ition, 481-)	**Persians,** Greeks.	Persians desire to avenge former defeat.	**Thermopylæ, Artemisium** (naval). **Athens burned,** Salamis (naval).	**Xerxes,** Leonidas (Sparta). **Achæmenes,** Eurybiades. Themistocles. Aristides.	After defeat at Salamis, Xerxes with part of his army retreated to Persia.
. Fourth rsian Ex-ition, 479.)	**Greater part of Xerxes' army** with allies from **Thessaly, Bœotia, Phocis,** and **Argos,** Athenians, Platæans. Thespians, and Spartans.	Desperate effort of Persians to overcome Greeks.	**Athens** laid waste, Platæa, Mycale (naval).	**Mardonius, Artabazus.** Pausanius (Sparta). Aristides. **Mardonius,** Leotychidas.	This ended Persian invasions and all Persian attempts to subjugate Greece.
rd Messe-n, 464-456.	**Helots of Messenian descent,** Spartans.	Confusion following earthquake gave Helots courage to revolt.	**Ithome** besieged.		Messenians capitulated. In this war Sparta implores and then returns Athenian aid, whereupon Athens allies herself to Argos, the rival of Sparta.
ponnesian 431-404. rst Period, 431-421.)	**Sparta and Allies,** Athens and Allies.	Sparta and her allies were jealous of Athens' growing power and influence; also discontent among some of the Athenian subject states.	Attica invaded, The plague there. Potidæa. Naval battles near Corinth. Siege of Mitylene. **Siege of Platæa.** Sphacteria. **Delium.** Amphipolis.	Phormio. **Archidamus, Agis,** Cleippides. **Brasidas.** Demosthenes. Hippocrates. Cleon.	Peace of Nicias (421) recognized Athens' supremacy over many Hellenic cities; Sparta had freed none from Athenian tyranny.
cond Pe-d or De-an War, 413-404.)	**Sparta,** Athens.	Sparta invades Attica weakened by great defeat of both her army and navy at Syracuse (413).	**Decelea occupied and Attica ravaged.** Many of Athens' subject states revolt. Abydos (naval). Cyzicus. **Notium** (naval). Arginusæ (naval). **Ægospotami. Athens.**	**Agis,** Alcibiades serves Athens, Sparta, and Athens in turn. **Mindarus,** Thrasybulus. **Callicratides,** Conon. **Lysander.**	The decisive victory of the Spartans at Ægospotami left the Athenians with all their resources exhausted; the Lacedæmonians tore down the walls of Piræus and Athens. Sparta was now supreme in Greece.
ond Sa-d, 355-346.	**Thebans, Locrians, Thessalians,** and **Macedonians,** Phocians.	Phocians seize and plunder Delphi because of fine imposed by Amphictyonic Council.		**Philip of Macedon,** Onomarchus. Phalæcus.	Thebans invite the aid of Philip against the Phocians and he becomes a member of the Amphictyonic Council.
ird Holy, 339-338.	**Thebans, Athenians,** Macedonians.	Philip is intrusted by the League with the punishment of Amphissa, whereupon he seized Elatea.	Chæronea.	Philip of Macedon.	By the battle of Chæronea Philip gains such an ascendency that henceforth Greece is under control of Macedonia.
Samnite, 343-266, t Samnite, 343-341	**Romans,** Samnites.	The Sidici invite aid of Romans against the Samnites, who ravage their land.	**Mount Gaurus. Suessula.**	**Marcus Valerius Corvus. P. Decius Mus.**	By a treaty of peace Rome received Capua, the Samnites, Teanum.

Name and Dates, B. C.	Contestants.	Cause or Pretext for War.	Notable Battles and Incidents of War.	Leaders.	Results and Treaties.
Greco-Persian, 334-330.	**Macedonians.** Persians.	Alexander, son of Philip, desires to carry out his father's plans to conquer Persia.	**Granicus** (334), **Issus** (333), **Arbela** (331).	**Alexander the Great,** Darius, Memnon.	Persian Empire conquered, marks the height of Macedonia power.
Second or Great Samnite, 326-304.	**Romans,** Samnites.	Encroachments of the Romans on the Liris.	Caudine Forks, **Capua,** **Vadimonian Lake, Bovianum.**	Gavius Pontius, **Q. Fabius Rullianus,** **P. Decius Mus.**	The Samnites beg for pea and are considered on an equali with Rome.
Third Samnite, 298-290.	**Romans,** Samnites.	War of Rome with Etruscans and Gauls tempts the Samnites, strengthened by league with Lucanians, to open hostilities.	**Sentinum,**	**Q. Fabius Rullianus,** **P. Decius Mus,** Pontius.	Romans become supreme power in Italy.
First Punic, 264-241.	**Romans,** Sicily, Carthage.	Some Campanian mercenaries, having seized Messana in Sicily, appeal to Rome for aid. It is a cause for Rome to give vent to her jealousy of Carthage.	**Agrigentum,** **Mylæ** (naval), **Ecnomus,** Tunes, **Panormus,** Drepanum (naval), **Ægatian Islands** (naval).	**C. Duilius,** **M. Atilius Regulus,** Hamilcar, **C. Lutatius Catulus,** Hanno.	Carthaginians evacuated Sici and paid a war indemnity.
Second Punic, 218-201.	**Rome,** Carthage.	Quarrel in Spain over encroachments of Carthage.	Ticinus, Trebia, Trasimene, Cannæ, **Nola,** **Syracuse,** **Capua,** **Metaurus** (207), **Zama** (202).	Hannibal, **Tiberius Sempronius Longus,** Nepos, **Marcellus,** **Flaccus,** **Fabius,** Hasdrubal, Nero, **Scipio.**	Hannibal, the "greatest gener in history," was worn out by t patience and loyalty of Ital Carthage forced to pay tribu and relinquish Spain. Her fle was burned and she agreed n to go to war without Rome's pe mission.
The Four Macedonian or Greco-Roman, 214-146.	**Romans,** Greeks.	Philip, a king of Macedon, is allied with Carthage.	**Cynoscephalæ,** **Pydna.**	**T. Quinctius Flamininus,** Philip of Macedon, Perseus, **L. Æmilius Paullus.**	Greece became a Roman pro ince.
Third Punic, 149-146.	**Rome,** Carthage.	War of Carthage with Massinissa, the pretext for Rome to open hostilities.	**Siege of Carthage.**	**Scipio Æmilianus Africanus.**	Carthage razed to the grou and most of her territory becar the Roman province of Africa.
Jugurthine, 111-105.	**Rome,** Numidia.	The rule of Jugurtha is displeasing to Rome.	**Muthul,** **Cirta.**	**Q. Metellus,** **Caius Marius,** Jugurtha.	Numidia, the strongest sta in Africa since Carthage, broug to complete subjection to Rom
Marsian or Social, 91-88.	**Rome,** Italian allies particularly the Marsians.	Italian socii resent that Rome makes laws for all Italy.	Massacre at Asculum, **Nola,** **Bovianum,** **Cannæ.**	**C. Marius,** **Sulla.**	Roman franchise extended all residents of Italy.
First Roman Civil War, 88-82.	**Sulla (optimates),** Marius (democrats).	The revolutionary laws of Sulpicius concerning voting which had been passed by means of violence.	**Sacriportus,** Reactionary Reign of Terror in Rome.	**Sulla,** **Pompey,** Marius, Carbo.	Sulla, backed by his army, h himself appointed dictator f an unlimited time.
Mithridatic, 88-64. (First, 88-84.) (Second, 83-81.) (Third, 74-64.)	**Rome,** Pontus and Armenia.	Mithridates IV. resents Roman interference and dictation.	Siege of Rhodes. Massacre of Roman citizens. **Chæronea,** **Orchomenus,** **Cabira,** **Tigranocerta,** **Lycos.**	**Sulla,** **Lucullus,** **Pompey,** Mithridates (Pontus), Tigranes (Armenia).	Rome extended her conque by overthrowing her most f midable opponent in the East.
Gladiatorial and Third Servile, 73-71.	**Romans,** Gladiators, and dissatisfied Italians.	Uprising of about 70 gladiators at Capua is joined by many discontented Italians.	Mt. Vesuvius, Mutina, **Mt. Calamatius.**	Spartacus, **Crassus,** **Pompey.**	This revolt, indicative of gr discontent, unsettled the foun tion of the empire and was down with difficulty.
Gallic, 58-51.	**Romans,** Gauls.	Rome desires to widen her conquests.	**Siege of Avaricum.** **Siege of Alesia.**	**Cæsar,** **P. Crassus,** Ariovistus, Cassivelaunus, Ambiorix, Vercingetorix.	Conquest of Gaul complet Britain subjected.
Second Roman Civil, 49-31. (First Period, 49-45.)	Followers of **Cæsar** (democrats), and Pompey and his sons (republican aristocrats).	The Republic had long been doomed and the struggle between strong men for the mastery was inevitable.	**Pharsalus,** **Thapsus** (Africa).	**Cæsar,** Pompey, Brutus, Scipio, Cato.	In 45 Cæsar caused himself to appointed dictator for life (si 49 he had been imperator), i he was a democratic monar The battle of Actium (31) ma the end of the Roman repu and the beginning of the emp
(Second Period, 44-30.)	Followers of **Octavius** and Antony.		**Mutina,** Philippi, **Actium.**	Cnæus and Sextus Pompeius. **Octavianus,** Antony.	

ames and ates, A. D.	Contestants.	Cause or Pretext for War.	Notable Battles and Incidents of War.	Leaders.	Results and Treaties.
wish-Ro-an, 66-70.	**Romans,** Jews.	Civil dissensions and Jewish revolt against Rome.	**Siege of Jerusalem.**	**Titus.**	Jerusalem and her temple destroyed.
ian 86-90. 101-102. 105-107.	**Rome,** Dacia.	Rome desires to extend her conquests.	**Tapæ.**	**Domitian, Trajan,** Decebalus.	This was the high-water mark of Roman conquest and possessions.
asions and quests of rthern es, 375-800. of Tribes: est Goths or ligoths, ndals, evi, ani, lic Franks Merovin-ans, rgundians, erulian andals, st Goths or strogoths, amanni, puarian ranks, tes, xons, gles, uringians, ngobards Lombards.	**Barbaric Tribes,** People of the Old Roman Empire.	Pressed from behind by the Mongolian Huns (who cross the Volga in 375), the Teutons encroach upon the Roman empire.	**Adrianople,** 378, (West Goths). **First Invasion of Italy,** 401 (West Goths). The Burgundians settle on the middle Rhine, 406-413. Salian Franks begin to occupy northern Gaul, 407. **Vandals invade Spain,** 409. **Sack of Rome,** 410 (West Goths). West Gothic kingdom of Tolosa (Toulouse), 415-507. Vandals settle in Africa, 429-534. **Carthage,** 439 (Vandals).	Valens. **Alaric** (West Goth), Stilicho (Western Empire). **Walja** (West Goth). **Genseric** (Vandal).	The direct result of the invasions of the barbarian hordes was the long period of assimilation and education of the invaders, called the Middle Ages. Of all the many kingdoms the Frankish was the only one to endure, and the year 800 marks the height of the extent and power of Charlemagne's empire.
		England invaded by Jutes, Angles, and Saxons, 449. Huns and East Goths ravage Gaul, 451. Battle near Châlons, 451.		**Hengist** and **Horsa** (Saxons). Attila (Hun), **Aetius.**	
		Huns destroy Aquileia, and Venice founded, 452. Rome plundered by Vandals, 455. Herulians gain ascendency in Rome. "The Fall of the Roman Empire," 476. Battle of Soissons, 486.		Leo, Bishop of Rome. **Odovakar.** **Clovis** or **Chlodwig** (Salic Frank), Syagrius.	
		Kingdom of Franks under Merovingians, 486-751. Clovis conquers the Alamanni and becomes Catholic Christian, 496. East Gothic kingdom in Italy, 493-555.		**Theodoric the Great** (East Goth).	
		West Goths settle in Spain, 507-711. Eastern Roman Empire destroys Vandal power in Africa, 533-534. Battle of Taginæ in Italy, 552.		**Belisarius,** Vitiges, **Narses,** Totila.	
		Lombard kingdom in Italy, 568-774. Battle of Deorham in England, 577.		Ceawlin (West Saxon).	
		Suevi settle in Spain, now Portugal, 585. Carolingian line established in Frankish kingdom, 751. Charlemagne destroys Langobard kingdom, 773-774; war with Saxons, 772-804; Spain, 778; Northmen, 788; Avars, 791-799. Charlemagne crowned Emperor of the West by Leo III., Christmas Day, 800.		**Pipin.** **Charlemagne.**	
racen or nammedan, 634-1492.	**Arabian, Saracens, Moors,** Syria, Persia, Egypt, North Africa, Turkey, Spain, **France, Sicily.**	Desire of Saracens to found an empire similar to the ancient Roman empire and make the world Mohammedan.	**Ajnadin, Damascus, Yermouk** (Syria), **Jerusalem** (637), **Cadesia** (Persia), **Nehavend** (Persia), **Alexandria** (Egypt), **Carthage,** Constantinople, **Xeres, Granada, Toledo, Seville, Bordeaux,** Tours (732), Jerusalem (1099). **Constantinople** (1453). Alhama, **Granada** (1492).	**Omar** (634-644), **Abi Wakkas,** Isdigerd, **Amru, Othman** (644-656), **Musa, Tarik, Ambessa,** Eudo, **Abd-er Rahman,** Charles Martel, Old (both Christian and Moslem sides), Constantine XIII., **Mohammed II.,** **Abdallah,** Ferdinand. SECOND WORLD WAR

Before the economic systems of the nations had recovered from the shocks of the depression that became rather world-wide after 1929, the clouds of a new threat of war began to gather over Europe. The power of Hitler in Germany and neighboring lands caused grave apprehension throughout the entire world. While Japan waged an undeclared war in China, Germany made an agreement with Japan as to mutual interests in the Orient, the effect of which was to increase the tension in Europe. Great Britain looked with increased suspicion on professions that the Japanese interest was merely benevolent and only an attempt to stabilize political and economic affairs in Asia.

Italy's swift incorporation of little Albania within the new Roman empire, for a time a threat for all Europe, led to no grave consequences, except perhaps to put the Balkan states again on their guard. Meanwhile, the several agreements between Mussolini and Hitler led to what both of them boasted as a new Berlin-Rome Axis around which affairs in Europe promised to revolve in their interest. The end of war in Spain, without spreading that conflict to regions outside, again left all nations with a chance to prepare for their next moves in the struggle to keep the peace of Europe. All loudly proclaimed their interest and devotion on the side of peace and harmony.

The main causes of a new war resembled those which led to the first World War in 1914. Some of the chief ones are these:

1. Rival imperialisms. Since the civilian population of Germany suffered little on their own soil from military events between 1914 and 1919, the loss of colonies became galling to the people. The idea grew upon them that they had been tricked and perhaps deserted finally by their own government. This idea was fostered and developed by the National Socialist or Nazi Party and was the source of their increasing power. Great Britain felt at last that Germany might be aiming for a new trial of strength. France felt nervous about her own eastern borders, and finally constructed an impregnable series of fortresses along the borders of Germany, most of them underground, known as the Maginot Line. The methods used in the absorption of Austria, and the betrayal of Czecho-Slovakia after the "Munich appeasement" again pointed the way toward which Germany was headed. Hitler's promise that he would make no more territorial demands may have delayed the impending storm for a little time. The willingness of Chamberlain's government in England to continue a so-called policy of appeasement also gave Germany a longer time to race her preparations at top speed with the intention of a new trial for domination in central Europe. France, meanwhile, was not idle in regard to new plans and preparations.

2. Trade rivalry between Germany and England, always a cause of friction, was not as great in 1939 as in 1914. Germany had been trying to gain new markets in South America. Before the war, Hitler himself declared to his people that "Germany must export or die." One objective, therefore, of his government must be to brush aside trade and commercial barriers to give Germany more of a free hand in world commerce. This was her policy of "Lebensrhum." For a long time Germany had looked toward the oil fields of Rumania, and Hitler's own declarations in his *Mein Kampf* included the plan to gain territory in the Ukraine, the rich granary of southwestern Russia. For this reason and others, Germany and Russia for some years had not been on good terms.

3. Another chief cause of the new conflict was the failure of the coöperative action provided by the League of Nations to supplant the old diplomacy and alliances that led to the first World War. Between 1914 and 1938 alignments had shifted and boundaries continued to be subjects of concern at many points. Border incidents occurred only too frequently. Slovakia felt somewhat submerged in the union with other districts in Czecho-Slovakia under the able leadership of the late President T. G. Masaryk. The break-up of the old Austrian empire caused other dislocations and pressures of people created by the Versailles Treaty under the Wilson Ethnological or Nationalistic Policy. Indeed, the small areas occupied by groups with nationalistic insistence have caused the great proportion of European wars for centuries. Russia always looked with secret longing toward the Baltic lands lost to her after the World War.

Poland for twenty years lived in constant fear of a new movement to make a fourth partition of her lands. Though a presidency in form, the government had been a virtual military dictatorship, not always of the benevolent sort. Military standing was strengthened. Pressure came from Russians in her eastern districts and on her borders; from the anomalous Danzig Free State, set up on her borders and interfering with her access to the seacoast. Therefore, after 1920, Poland built Gydnia, a new port of some scope and importance, free from the League of Nations' rule as was the case in Danzig.

4. Another immediate cause was the organization of huge standing armies ready to go at the word of command. Thus the tensity increased. One nation accused the other of mobilizing, as Germany did Poland after the forces of the Reich were well placed and some had even commenced to move toward their objectives. The armies of Russia and Finland stood almost in sight of each other some days in advance of actual hostilities. So were the forces of France at her eastern gates. Reports of calling men to the colors in the Balkans were frequent. Insults to soldiers by foreign civilians were reported and some "atrocities," none of them probably well proved or authenticated. Belgium and Holland were alert, hoping not to be caught undefended as Belgium was in part in 1914.

So the stage was set for a new war on September 1, 1939. On that day forces of Germany moved into Poland. For many days in advance all interested parties had prepared and sought to shift the blame for the final break in negotiations. The Allies waited two days to give Germany a chance to withdraw from Poland. Since May it had been known in Berlin that Britain would sup-

port Poland and France if the former were attacked. Hitler at times showed signs of uncertainty. In his last six conferences with the British ambassador, between August 23 and 30, he revealed different characteristics and seemed to grow more irritable and insistent. In one of these talks Hitler declared he was an artist anyway, not a statesman, and, after he had settled the case with Poland, wanted to settle down. He asked Britain to negotiate after Poland had been taken in hand.

Toward the last, Hitler brought forth 16 proposals as to the dispute with Poland over Danzig and other subjects. These seem to have reached Poland too late, though they had been broadcast. When the British envoy called to see the text the German foreign minister read it "at top speed," and then declared it was too late. At least one of the German officials earlier had admitted that Hitler could not be held to reason. It was finally demanded that Poland must send an envoy with power to negotiate within one day.

What happened at this point is in dispute. Britain insists that the Poles agreed to negotiate, but it was impossible to accede to terms before they had been given or explained at all. No time was left to negotiate farther. The British say that Hitler then seemed bent on war at all costs. He had been willing before to hold back his forces if his demands should be met without question, not otherwise. The Poles were said to be an inferior, lawless, quarrelsome people, and the army was ready. So why not punish them for the border incidents then said to be taking place? Danzig must be incorporated into the Reich; Memel had already been taken since the Munich Conference, when Hitler solemnly declared that he had no more ambitions for territory in Europe.

Before the invasion of Poland, the German press for weeks had built up a series of inflammatory reports of arrogance and encroachments of the Polish people. Hitler announced the war after aviators had begun to bomb Polish towns on September 1. Neutrals had reported the free city of Danzig to be calm, the Germans that it was a hotbed of revolt, and so they took over this area at once. On September 3, England and France declared war against the Reich.

Germany at once launched a campaign on south, west, and north fronts. Airplanes and motorized units rushed to combat with an intensity hitherto unknown in warfare. The careful plans of the Hitler forces closed in on the Poles, until little was left for them except a circle about Warsaw. Towns and civilian points suffered from indiscriminate bombings. The capital was scarred, blasted, and in many quarters left a heap of ruins. Hitler declared the Poles to be subdued on September 23, but mopping-up continued for a number of days. The invaders lost an admitted total of 50,000, but probably the number is far too small, for Polish aviators and trained troops had subjected certain points to withering fire for some days. The Poles might have continued to resist, except that Russia, on September 17, sent a force across the eastern border, and was rewarded with a large slice of territory in the settlement with Poland.

Britain and France could send little effective aid, being unable to reach the center of the conflict. The Polish government finally took refuge, first in Rumania, and at last in Paris. There a new government was also set up for Czechoslovakia in exile on October 4. President Lebrun promised that Austria, Poland, Czechoslovakia, and any other oppressed peoples would eventually be freed of German domination.

Russia continued to boast of peaceful intentions right up to the day of her invasion into Poland. She continued aggressive tactics and threats on all her western neighbors. Pacts were made with Estonia, Latvia, and Lithuania allowing Russia military advantages, the establishment of bases, and other concessions which virtually extinguished the sovereignty of these little countries. Vilna was taken from Poland and restored to the Liths, who held it until after the first World War, but Russia gained new grants for herself through this move. The various agreements may have been made with the sanction of Germany.

On August 24, Herr von Ribbentrop representing Germany brought Russia into a commercial agreement, with possibly other understandings that were not then or later made public. All moves were made so secretly that not even Japan, Germany's eastern ally, was warned of them. The Russian agreement caused such a commotion in Tokio that the cabinet resigned, and a temporary move was made to appease the democracies, notably England and the United States, while the campaign of Japan lagged in China.

The game of diplomacy, threats, and propaganda continued, until it was termed "the war of nerves." Great Britain and France wooed Italy. For a time Mussolini professed complete neutrality, and some German sympathizers were eased out of the Fascist cabinet. Rumania agreed to sell oil to Germany, but deliveries were slow, sabotage was charged, and at last Hitler moved into that land "to protect it." King Carol was afterward forced to abdicate and to flee, and a new regime, favorable to the third Reich, was meanwhile set up at Bucharest. Turkey signed an agreement with Britain and France, and refused to be won by any threats or promises of gain for abandoning neutrality. King Carol had intimated to Russia, when the great bear was having trouble with Finland, that no concessions of territory in Bessarabia would be granted short of war. Eventually, however, Russia got more than her demands.

Russo-Finnish War. In 1939 the Finnish delegation left Russia after days of fruitless negotiations. The demands were for Finland to give up three islands in the Gulf of Finland too near to the Russian naval base at Kronstadt and to Leningrad; a strip of land in return for part of Soviet Karelia; demilitarization of the Finnish eastern border; port privileges at Hanko; and land near Petsamo in the north, to give Russia access to nickel deposits and to Swedish iron supplies. The Finns were willing to grant the demands in modified form. Russia broke off suddenly on November 30, rained bombs on Finnish towns, and started troops across the frontier. The Finns at last countered and between December 14 and January 7 destroyed three whole Russian divisions. Until February 1 Russian troops and equipment were both rather poor. Even when trained men and great quantities of modern weapons arrived, the Russian losses were appalling. Yet their superior numbers by March 1 were beating down stubborn resistance at several points.

The eastern forts began to give way, and the Finns had to fall back to save their lives and materials. About 50,000 inhabitants along the eastern border left their homes, and many never returned to them. On March 11 the Allies offered aid if Finland requested it. Two days later, however, the brave Finns gave in to save their land and people from further assaults and destruction.

Admitted losses of the Finns were 15,700 killed and about that many missing, with 26,800 wounded, in a total army of about 230,000. Russia never admitted any reliable figures, but neutrals placed the losses at 200,000 killed, fully that many wounded. Finland claimed the loss of 794 Russian planes, and 361 of their own. The country lost about 9,500 square miles to Russia in the peace settlements, and about 8% of wood pulp lands, the chief Finnish resource. The total national debt, after the war, rose to about $122,500,000, which is about 70% of what Finland owed in 1931.

Sentiment particularly in America had favored little Finland. Here was a nation of fewer than 4,000,000 inhabitants and an army of fewer than 400,000 daring to withstand a force of 2,000,000 or more and a people of 150,000,000. In the midst of the conflict with Russia, the usual amount of $3,000,000 was tendered by Finland as the semi-annual payment on the first World War loan, but was loaned back for supplies.

Invasion of Norway. Vague rumors kept coming as to where the Germans intended to strike next. Some said that neutrality of nations to the north would be respected; others doubted any German promises. On April 7, 1940, rumors of new movements were confirmed. Within a few days it was admitted that Denmark had given way without resistance. On April 9, Oslo found German troops there in force. Two Reich warships were sunk by Norwegian efforts. Later reports claimed that at least 60,000 Germans suffered death or wounds in attempting to gain a foothold along the eastern, southern, and western coasts of Norway. Mechanized troops pushed through the country. British aid at Narvick and other ports had to be withdrawn, owing to difficulty as to transportation and supplies. At least seven warships of size were destroyed by the British at Narvick, and also some submarines, with loss of two British cruisers and two sub-sea craft. In turn, Britain seized the Faroe Islands north of Scotland and later established bases in Iceland, belonging to Denmark, which declared itself free of the mother country as to action in the war. Though the British withdrew with losses, the Reich paid dear in this campaign and gained no great advantage in being able to use Norway as a base. The British kept close watch and prevented the establishment of effective air bases. When the campaign in Norway was over, the Germans were said to have suffered huge losses to their shipping, convoys, and even to the submarine strength.

The War at Sea. By the time the British withdrew from Norway, according to the French premier, the Reich had lost about one-third of the active ships in the North Sea and adjacent waters. Some 309 ships of Germany had been interned in neutral ports,—over one-third their total merchant strength before the war began. It was asserted that some 40 to 60 of the German submarines had been lost, but building proceeded rapidly. Fewer British merchant ships were being sunk. On November 13, 1940, the British Admiralty gave these as losses for the first year of the war: Great Britain, 405 ships of total tonnage of 1,611,842; allied, 103 of 474,816; neutral, 253 of 769,212 tons; loss of life, 3,327, with 1,100 prisoners, and 15,635 seamen and passengers saved. Enemy losses were placed at 261 of a tonnage of "about 1,269,000 tons."

Controversy raged as to whether any aircraft could sink a modern battleship. The Reich repeatedly claimed such a fact, while the British usually came back with a flat or modified denial. It was even claimed two large battleships, announced as sunk in German reports, had been repaired and were again in service. The first major sea casualty of the war was the loss of the passenger ship, *Athena,* destroyed by a torpedo or mine on September 4, 1939, with a great loss of life. Within a month sinking or serious damage had come to the huge British airplane carrier, *Courageous;* to the *Royal Oak,* a large battleship, said to have been sunk at its base in Scapa Flow during a daring raid by the Germans; and to the *Iron Duke,* a principal training ship. On November 23, 1939, the *Rawalpindi,* huge armed merchantman, was destroyed by a German raider.

In December, 1939, a most spectacular sea fight occurred off the shores of South America. Three British cruisers, the *Exeter, Ajax,* and *Achilles* engaged the German *Graf Spee* in a running sea fight. Badly damaged, and with a large loss in crew, the latter sought shelter in the harbor of Montevideo, Uruguay. Repairs could not be completed in three days as required, so the *Graf Spee* put out to sea and was sunk and burned to the water's edge (it is said under direct orders from Hitler). The captain later committed suicide, while the rescued crew was interned in Argentina. The *Exeter,* badly damaged, had to be reconditioned. Details of the escape of the *Graf Spee* were broadcast from Montevideo as well as part of the battle as it occurred,—the first radio broadcast of such a fight.

While trying to escape from Mexico, the German liner *Columbus* was pursued by an enemy destroyer. As a result, she was scuttled off the eastern coast of the United States by her own crew,—a fate which numerous other German boats have also suffered. The giant luxury liner *Bremen* left New York three days before war was declared, sought refuge at Murmansk in northern Russia, and finally stole home on December 12. In March, 1941, she was burned while in her home port.

After the fall of France, the greatest worry of England was the disposition of the French fleet. Most of it was in the Mediterranean Sea, at African bases. The fleet was not surrendered by France to Germany. England demanded either its surrender or immobilization on short notice. The forces based at Alexandria in the Eastern Mediterranean were immobilized under English guns. No reply being received from the Western bases, the English fleet moved in and largely destroyed the French fleet, thereby removing it as a possible menace in Hitler's hands.

German strategy, on both land and sea, was that of the quick thrust and escape before effective attack could be made. Small, fleet cruisers

that came to be known as "pocket battleships" were built and inflicted considerable damage to the British merchant marine. Of such type was the *Graf Spee*. Heavier, slow British units, however, were able to pound them unmercifully when within striking range. British strategy was that of a tight blockade. Again, as in the first World War, a convoy system was organized, but there were necessarily many losses through submarine attacks. Many Reich claims were made from time to time. Early in 1941 the British asserted that the Germans already had claimed the sinking or fatal damage to more craft, of certain classes, than the Royal Navy had possessed at any time. Still Britannia continued to rule the waves. Reich reports of sinkings of merchant ships often seemed to double the actual numbers destroyed. As late as April 1, 1941, the British claimed to be much stronger, relatively speaking, in ships than at the start of World War II.

The Royal Navy had been active on all seas, and battles had taken place off South America, in the Indian Ocean, at Dakar off the coast of Africa, in the Mediterranean (two or three at the shores of Italy), in the harbor of Alexandria, Egypt, and elsewhere. The British slipped into the vicinity of Genoa and hurled shells upon the city; in the eastern waters, they had several times showed Italy they were on the alert. Many German merchant boats and war craft of all sizes went down. However, the most important naval battle up to April 1, 1941 occurred the last of March in the Ionian sea, resulting in the virtual elimination of Italy as a naval power. Rescued survivors showed that Germans were now on Italian ships. This notable victory occurred without a single British casualty in ships or lives.

Meanwhile, at times Britain suffered tremendous loss of shipping. Hitler announced that a new air, submarine, and cruiser attack would be launched on March 15, 1941. Within a few days of that date, British shipping suffered severe blows. The Royal Admiralty announced that two pocket battleships were at large in the Atlantic, perhaps near the shores of America, while in the Indian Ocean and in the Mediterranean ships went down.

The Western Front. Hitler promised a *blitzkrieg* or lightning attack on England by his air fleet. All Britain down to the young babies in their perambulators were equipped with gas masks. For weeks and weeks only minor raids occurred, while both forces made themselves ready. Tons of pamphlets were released. Britain tried to wean the German people away from allegiance to Hitler. Royal aviators pounded away at the Kiel canal, naval bases, and definite military centers. The war of words was bitter and hectic. Churchill radioed that Hitler was a "cornered maniac." A German, said by some to be Hitler himself, flung back the taunt, "We are too good to bleed to death so that London and the Jews can shake hands."

Day after day reports on the western front indicated only minor raids, or no particular activity. Both sides waited for something, not quite apparent. Some began to exclaim that this was a "phony war," not taken seriously at all by either side. Up to January 1, 1940—the first four months of the war—the British lost on the continent 200 men; in the same time in 1914, hundreds of thousands had been slaughtered in France. In February of 1915, the Allies alone lost 240,000 along the Somme. In gaining Verdun the Germans lost over 278,000. The newspapers looked for great onslaughts and trench warfare again as in 1915. At last all realized that the style of war had been completely changed.

Both France and Germany had built lines considered impregnable to attack. The French Maginot Line was equipped with clever devices to ward off an enemy according to tactics expected to be applied by the Germans. Meanwhile, the French were allowed to invade small portions of German soil, and to make progress between Luxembourg and the River Rhine. In the Saar, along the Moselle, and at several towns like Saarbrucken and Sierck, the raiders gained spoils and advantages. The whole world wondered what Hitler would command next. Would he attack the Maginot Line directly? Or would he try to beat around the end, especially at the north where it terminated in Belgium, leaving part of that country and Holland a path for invasion? Several dress rehearsals were staged. The Germans were said to have from 30 to 75 divisions massed back of their own Siegfried Line. The Polish war lasted less than 30 days. Then the huge forces turned westward and began to prepare for a real strike. Belgium and Holland trembled and their monarchs pleaded for peace, while their people maintained as strict a neutrality as they knew how to keep.

France was profoundly shaken by the fall of Poland and the invasion of Norway. Premier Daladier was finally forced out of office on March 20, 1940. Paul Reynaud took his place while the attack on Norway was in progress.

On May 10 the fury struck in complete force. The invaders chose some of the easiest routes into Holland and Belgium on the way to France, while the defending legions were spread out from the North Sea to the Swiss border. Methods then unknown were revealed,—the use of parachute troops to gain a foothold, heavy motorized units, flame throwers, and some claimed a secret kind of gas. The attack did not fall on northern Belgium as the French thought. After going in the direction of the Channel ports, the invaders turned south and west, followed the river courses, got across bridges before these could be blown up, beat down any opposition from infantry, and rolled on at some points almost unmolested. The French could not hold. They had been thinking in terms of warfare in 1915. Forts at Liége were taken in three days in 1940, which had held out for months in 1914. Everything was on the same scale. On May 24, the German advance reached Boulogne and Calais, and the British and French contingents in Flanders were thrust eastward and in grave peril. When King Leopold surrendered the whole Belgian army on May 28, the British were in a desperate position. It was too late now to reform the lines completely, as the withdrawal of the Belgians necessitated. Nothing remained but retreat to the Channel. While the French and some English units kept the Germans in check for several days, 335,000 men were ferried across the sea to Britain in every conceivable kind of boat, steamer, craft, and anything that could be kept afloat. Meanwhile, the Royal Air Forces shuttled back and forth over the convoys, keeping the German air forces away in large part. This super-

human feat of rescue helped counterbalance the complete collapse of the French campaigns.

The Germans swept south and west and entered Paris without great local opposition. On June 10, Mussolini led Italy into war, with his characteristic boasts of invincibility of the Roman legions, and the restoration of Italy to her pristine glories. On June 20, France was forced into an humiliating armistice in Compeigne Forest, where the delegation met the Germans in the same spot and same railway car that sheltered Marshal Foch on November 11, 1918. Hostilities ended on June 26. By the terms of the armistice (for no definite peace could be made) France was divided into two parts, "Occupied and Unoccupied" France. German troops occupied France from the Swiss border, northwest to the south of Paris, the city being in the occupied part, then to the Atlantic Ocean, and a strip south along the coast to Spain. In this way, Germany occupied all the coastal region for bases in her continuation of the war against England. Meanwhile, Marshal Henri Petain had become premier of France and the government was established at Vichy.

As time went on the French became hard pressed in their narrowed provinces at home. The government of Marshal Petain threatened to use the remainder of the French navy to convoy food ships to France, if Britain refused to relax the blockade. Constant pressure by Germany, aided by despairing Frenchmen and German sympathizers at home, made the Vichy government almost powerless to resist. Shortly after the armistice with Germany on May 26, 1940, General Charles De Gaulle set up in England a "free French" movement, aided by a provisional government there. Marshal Weygand, who had replaced Gamelin, returned to guard the French interests in Asia, mainly in Syria, the position of which as a mandated territory remained obscure. After a hurried trip to Vichy in March, 1941, Weygand announced that the French colonies would be defended. Since some of them in Africa already had joined with Britain in the campaign against Italy there, the force of Weygand's remark was somewhat questionable. Rumors circulated that the real objective of Hitler was to gain access to the oil of Asia through Greece, Turkey, and Syria.

The African Campaigns. When Italy joined the Axis partnership in June of 1940, something seemed coming to them in fulfilment of the dreams of empire in northern Africa. Italy was in no shape to support extensive campaigns either by money or by men, though she had modern equipment for about 100,000 soldiers. In planes and submarines Mussolini seemed at first to have some chance of making the Mediterranean his sea. Yet the navy avoided conflict with the Royal navy, and in several encounters much damage was done to Italian cruisers and prestige as well. Off Alexandria, Egypt, nearer home in the Adriatic, in the eastern areas, and in the vicinity of Spain, British naval units gave a good account of themselves. Meanwhile, the Italians were allowed to enter some little distance into Egypt, while General Wavell and his staff made preparations for the empire forces. The Italians seemed trying to reach the Suez Canal. When the British finally struck, the invaders were quickly driven back, and by a succession of forced marches into Libya, the entire territory in the east was cleared of soldiers. At the same time, free French forces made long marches from the Sudan to join the British against Somaliland and Eritrea. By the end of March, 1941, Italian resistance had been broken, and the "Babel Army," composed of various units of African natives, French territorials, British, Ethiopians, Indians, Australians, and others, had taken Italian Somaliland, and by April 6, 1941, had retaken Addis Ababa, completing the fall of Mussolini's African Empire. These victories released additional troops for the Balkan front which was now ablaze.

The War in the Air. Occasional raids were carried out before the stage of the war which eliminated France as an active force. Hundreds of thousands of children were sent to the country in August, 1939. Within the next six or nine months most of them had returned. The people of London began to become careless as to their gas masks. The "battle of England" began in earnest on August 1, 1940, when immense waves of German bombers surged over the Portsmouth naval area, Thames estuary, and parts of London, leaving unprecedented havoc behind them. The R. A. F. replied in kind, but kept to the main military and naval objectives for a time. In mass daylight raids, the Germans sent over as many as 1,000 planes, but their loss was terrific, when as many as 137 planes were downed in a single day. Mass formations gave place to single flights and to small operations from different angles and at different heights at once. For 58 nights London was pounded by the German aircraft. Later industrial centers like Liverpool, Coventry, Plymouth, and other strategic points were strafed, while Scotland and Wales were not spared,—nor were some non-military objectives. New types of incendiary and explosive bombs were dropped in numbers. Many buildings crumpled up and fell like flimsy houses of cardboard. British business tried to carry on as usual. On October 21, after suffering for 45 consecutive days from German fury, the Royal Air Force launched two heavy attacks on Berlin. Hitler's propaganda agents had led the people to believe that Britain could do little damage in the capital. On the same night, after refraining for two months, the R. A. F. launched vicious assaults on certain Italian military cities. It became evident, however, in time that neither side could wear down the other by air raids alone. Naval experts, as usual, were still claiming that eventually the war would be won at sea. On October 7, 1940, military observers estimated that 6,500 German planes had been destroyed, and 13,000 aviators had been killed. On October 21, 1940 and March 22, 1941, the British Minister of Aircraft Production declared that the English had more aircraft than ever before, and that they were gaining in numbers and in size and efficiency of the planes.

The African Front. Hitler's 1941 New Year speech promised "the greatest victory in our history." Mussolini was likewise elated by successes in Africa, after he had joined the Axis partnership. Already Poland, Denmark, Norway, the Netherlands, Belgium, Luxemburg, and France had passed under the Hitler yoke. The British answered the Axis, however, by taking Bardia in Africa, and then pushing on to El

Agheila, through the places later made familiar to us by the surging of battle across the sands of Libya. The Italians quickly lost 150,000 men and huge stores of arms and equipment to a British army under General Wavell numbering about 40,000. By April General Rommel had gathered another great force, and the British were pushed back. Meanwhile, the Italians had been driven out of East Africa. On April 6, they evacuated Addis Abbaba, and a month later Haile Selassie was again on his throne in Ethiopia. During November and December, British tanks and planes again gained the initiative, but Rommel, the fox, escaped a trap once more.

The Balkan Campaigns. Likewise the tide of battle surged back and forth in the Balkans. The task of Mussolini was to take Albania, Yugoslavia, and Greece while Hitler was busy elsewhere. At first his legions gained some territory. Demands were made on the Greeks in the fall of 1940, most being rejected. Invasion followed on October 28. Instead of meeting another bewildered and unprepared nation, Mussolini found the Greeks too much for him, with a strong, virile, well-disciplined force. Athens had prepared in secret and had even allowed the Axis to get wrong reports from there. Likewise the Serbs proved rather tough, but the Croats were ready for infiltration and partnership with the Axis. Hitler was compelled to send immense forces to lay waste Yugoslavia and burn the city of Belgrade. The main armies capitulated in twelve days, but bands in the mountains carried on a guerrilla campaign which is said to have kept several German divisions occupied. These hardy Serbs were still reported in action at the end of the next year. German mechanized panzer troops swept through Greece until, on April 28, 1941, the swastika flew over the Acropolis at Athens. Meanwhile, British soldiers had been withdrawn from the campaigns in middle Asia to assist the Hellenic armies. They came too late and too poorly equipped. Finally, a large force of parachute Nazis landed in Crete and forced the British and Allies out. Allied losses were heavy in a second evacuation like that at Dunkerque when France fell the year before. As yet Mussolini had not been able to make the Mediterranean "our sea," as he had called it in a speech. The British naval units patrolled the entire length from Alexandria to Gibraltar, and on March 28 defeated an Italian force at Cape Matapan. Gibraltar still held after various nuisance raids, for which the British retaliated by bombing Genoa from the sea. Submarines and aircraft also took their liberal toll from the Italians. In the months to come the British stronghold at Malta survived the greatest expenditure of bombs and planes ever thrown recklessly against a similar target.

The eastern Balkans had been seething with rumors and agents. King Carol of Rumania left his son on the throne and fled the country. Britain broke with Bulgaria when Nazi agents overran the land in civilian garb. Russia was displeased and drew nearer to Greece and Serbia. Germany had tried to place a puppet government at Belgrade, but the forces of young King Peter had come out ahead. These events had led to the invasion of Yugoslavia after the typical Nazi campaign of propaganda as to border and other incidents. The Croats were glad to side against their partners, the Serbs, in Yugoslavia. Italy and Bulgaria were allowed by Hitler to retain bits of conquered borderlands.

Events in Asia. One of Hitler's designs seemed to be to threaten the middle East and India; another to capture the Suez Canal and keep British commerce from this short route to the far East. In these and other designs, Great Britain and Russia were well able to thwart most of his plans. German infiltration reached a serious limit. Rashid Ali in Iraq attempted a coup in favor of the Axis; the British retaliated by capturing an important airfield, and the movement collapsed, while Rashid fled. Hitler was also too busy dropping parachute troops in Crete, in taking some of the small islands, and in keeping the Balkans in what he had been calling his "new order in Europe."

Tension between Vichy and Britain increased. What should be done as to the French possessions in Africa and Asia? Syria seemed threatened when German planes landed there on the way eastward. Vichy admitted they had not resisted properly. Some of the Free French forces assisted the British in a half-hearted campaign which ended with the fall of Damascus on June 21 and an armistice on July 12. British and Russian diplomacy at last roused Iran and Afghanistan to reject the blandishments of Nazi agents, and to declare themselves unwilling to join the Axis band.

The Battles at Sea. As the third year of the war began on September 1, 1941, the British seemed stronger at sea, despite huge losses. In two years 260 vessels had gone down, including two battleships of major class, two carriers, nine cruisers, 51 destroyers, 29 submarines, 14 armed merchant cruisers. Convoys had lost few ships compared with the great numbers shuttling back and forth across the Atlantic. The Italian navy was cut down considerably, and the rest seemed unable to accomplish anything vital. In two years 7,000,000 tons of allied shipping had been destroyed, with a million more for neutrals. To August 1, 1941, estimates include 1,078 British, 334 allied, and 326 neutral craft of all classes. On October 1, the Associated Press showed reports of over 2,000 vessels, 2½ daily, from 31 nations. Lives of 18,000 had been lost, with over 9,000 persons missing. France had lost half her merchant marine, and Sweden a total of 118 ships. German losses were concealed and unknown.

On May 24, the roving German heavy battleships *Bismarck* and *Prince Eugen* sank the immense British *Hood* between Greenland and Iceland. Warships rushed to the kill from all directions, and two days later the *Bismarck* was torpedoed and destroyed with loss of life comparable to that of the *Hood*. *Prince Eugen* and other German cruisers took refuge along the French shores, escaped once or twice under British fire and losses, and did some later damage, but were confined mainly to ports in France, Germany, and Norway. Underwater boats continued a great menace all over the seas, notably on the shores of the Americas in 1942. By the beginning of 1943, the British admiralty an-

nounced that all naval losses had been replaced, and indeed the British were better off than in 1939. The Nazi submarine continued, however, as a real and terrible menace to ocean shipping, though at times, in 1941 and later, operations were not especially troublesome. Convoys were getting through to Britain, and especially by the north route to Russia, despite tremendous odds of weather and submarines. The same is true of operations of the United Nations in the Pacific, so far as convoys were concerned. By May 1943, it was felt that the North Atlantic convoy route had become so well protected that most U. S. ships were released for Pacific duty.

Likewise aerial attacks on Britain claimed a huge total of lives and no end of damage, estimated at nearly half a billion in England alone. By October 1, 1941, the Germans were thought to have lost 16,000 planes with 19,000 pilots; the British 3,100 planes and 6,500 dead. By the middle of 1942 British output of materials seems to have passed that of Germany, notably in aircraft.

Russian Fronts. Both sides had been doing their utmost to interest Russia. Hitler and Stalin met to exchange views. The strange arrival from Germany of Rudolph Hess in Scotland on May 12 stirred Britain to greater watchfulness. Hess was sent to sound out the British, to buy them off against Russia, or for some other unknown purpose. Churchill continued to warn Stalin, who perhaps was not so phlegmatic as some of the experts fancied. By June, Hitler had the Balkans well in hand, and affairs in Africa were not causing so much attention. Something had to be done, and he pondered and consulted his "intuition." On June 21, 1941, he struck without warning and the usual border incident propaganda on a great scale.

Hitler no doubt expected a quick conquest. Events in the next five months seemed to favor such a view. The Russian borders were not well protected, nor the great flatlands on the way to Moscow and other great centers. Then, too, the Russian military machine had not reached high gear, but immense stores of material and men had been collected within the interior and across the Ural mountains. Perhaps Hitler did not count on these. The Germans penetrated some 355 miles in two weeks. The end of the autumn found Kiev and Odessa, two of the main objectives, already in German hands. Rostov had fallen on November 23. By December 1, 1941, the Germans were knocking at the doors of both Leningrad and Moscow. Soldiers fully expected to spend the winter in warm apartments of Leningrad and Moscow. Instead they met the fiercest blasts the steppes had seen in many years. Norwegians were ordered to provide blankets for the Nazi invaders, halted between the Volga and the Don, and in the North.

By the middle of December, 1941, the hoards had covered a part of Russia equal almost to their own Germany. Yet it was no push-over. Some think the Russians lured their foes farther and farther from their natural bases of supplies, while the Soviets retired, leaving a scorched earth behind. Hitler stormed and boasted. In the invader's time-table Stalingrad was to fall in three weeks. Yet the Russians stiffened their lines suddenly. Further, they had a nasty habit of killing off the Germans behind the main lines, of other sly tactics, of resisting with unparalleled ferocity, in which women and sometimes even children joined. Hitler had asked for total war, but he seemed surprised when Stalin gave it to him. In the southern sector stretching into the Caucasus, some better luck came to the Nazis. No doubt they needed the rich flow of oil beyond, but only the Maikop fields were taken. Indeed, the campaigns everywhere appeared to halt just short of their great objectives.

So the history of the incredible resistance of the Russian people stretches across the months of 1942. Nobody had dreamed that even Russia could bring forth such masses of men, and certainly not of materials and skilled technicians. Leningrad never really fell, although fighting desolated many of the city streets and factories, while men grappled there and even in doorways and buildings. Fifteen months after the proud boasts that this favorite city must fall within the first month, over 200,000 Germans had paid the ultimate price for the madness of the man they called their leader. Now only a starving remnant was either giving up or being killed off day by day.

With strength and tenacity almost beyond imagination, the great hoards of reinforcements came from the east. During the winter of 1942–1943 the invaders had been shoved back about a third of the way toward the German borders, losing all the advance made in the campaign of 1942. An advance of 150 miles west of Stalingrad left thousands pocketed and with help falling far short. The Germans were gradually being beaten back in the Caucasus and Rostov was retaken for the second time. About December, 1941, the Soviets estimated their killed at 490,000, and the Germans at two or three times that number at least. Hitler propagandists issued fantastic figures of Russian casualties.

Global War. The treachery of Japan on December 7, 1941, with the attack on Pearl Harbor, Hawaii, began a truly global war, which quickly spread to all continents and the seven seas. Japan and the United States for some time had been negotiating about affairs in the far Pacific. The Nipponese had received tremendous stores of oil and metals from America. At last they sent a special envoy to Washington to compose some differences with the Roosevelt government. American proposals of November 27 remained unanswered, while a personal appeal went to the Japanese emperor from the White House. The very hour when Japanese envoys appeared to talk with the Secretary of State was the time when their countrymen attacked in Hawaii.

It soon appeared that the United States had suffered a terrible defeat at Pearl Harbor,—which indeed proved the worst in our history. On the first anniversary, complete details were officially released. The great battleship *Arizona* was a total loss. Four others, three destroyers, one target ship, a mine layer, had been put out of commission. Within the year, however, the *Pennsylvania*, *Maryland*, *Tennessee*, and the cruisers *Helena*, *Honolulu*, and *Raleigh*, with a seaplane tender, repair ship, floating dock, and smaller craft had again been placed in service. We lost 117 planes, 2,343 men, with another 860

still missing, and also 396 wounded, but most of the latter group had already reported again for duty. The Nipponese lost about 50 aircraft and three small submarines. Indignation in America forced a sudden shift in command in both Navy and Army, and a resolution to prosecute the war to any length and with all possible costs. Within one year, the Japanese had lost a total of not fewer than 505 ships, to 78 for the United States. Between August 7 and November 15, 1942, naval losses were 111 to only 28 for the Americans. These figures generally neglect damage to our shipping.

Like their Axis partners in Europe, the Japanese intended to conquer by some deft and sudden attacks over a wide area in the lands about them. The Philippine Islands soon felt the weight of their total might, and after staggering losses in men, boats, and equipment the Japanese took control. Native Filipino troops, led by General MacArthur performed feats of unbelievable daring and endurance, fighting side by side with too small an American force. At last they were driven to refuge in the fortress of Corregidor, and there were defeated largely by hunger and lack of adequate ammunition. On May 2 and 3 they gave up the struggle, save some few who remained in the hills and on other islands, to help the natives in their guerrilla tactics. Their fate was an enemy prison camp. On March 31, 1942, MacArthur had escaped to Australia where later he became head of the Allied forces in the Southwest Pacific.

Swiftly meanwhile the Japanese had forced their way into Thailand, Burma, Malaya, including the British stronghold of Singapore, the islands of the Netherlands East Indies, and some possessions of other peoples. One main objective was Australia, and the Nipponese established themselves on adjacent islands like New Guinea, Guadalcanal, and others of and near the Solomon group. The British had made a fatal mistake of neglecting to defend Malaya from land attack through the upper jungles.

Allied Successes. The United Nations had few successes before May, 1942. Then came the naval battles of Coral Sea, Midway, and the Solomons. American marines landed at Guadalcanal and in New Guinea and displaced the Nipponese, who suffered terrible losses while trying to land troops and supplies four times in the fall of 1942. By count they lost nearly 12,000 in the operations on Guadalcanal Island. When the Burma Road was closed, the United States provided a commander and force of pilots for Chinese defense. Supplies were also sent in by different means and routes. The year 1942 gave the Japanese some set-backs, and no great victories in China. In five years Japanese losses were estimated at 2,500,000, while China admitted a toll of over twice that number. At Midway Island, in the Aleutians, and New Guinea in 1943 the Japanese suffered impressive set-backs.

North African Front. In the closing weeks of 1942, North Africa furnished the chief excitement, outside of the Russian campaigns. Rommel was chased from Egypt across Libya, and to the very borders of Tripoli. His losses were between 75 and 100 thousand. Italians bore the brunt of attack by land and sea elsewhere from the United forces. Dakar and the rest of French Africa came over to the side of the Allies. Admiral Darlan came into political power in North Africa for the French, but later was killed by an assassin. After weeks of secret and minute planning, the British and Americans landed a great force at Casablanca and other African ports. About 850 ships were used in this undertaking, greatest of its kind in history. After a brief but stubborn resistance, the French gave way, and soon were cooperating with the Americans and British. Political fortunes of that region were still doubtful the early months of 1943. However, the first part of 1943 saw the historic Casablanca conference, the hemming in of the Axis in the tip of Tunisia, and the fall of Bizerte and Tunis.

FIRST WORLD WAR

After Germany defeated France in the Franco-Prussian War and took two provinces, Alsace and Lorraine, uneasiness in Europe gradually increased until the World War broke out in 1914. A conflict had been openly predicted in various capitals for several years. On June 28, 1914, the Austrian archduke, Francis Ferdinand, heir to the throne of Austria-Hungary, was killed by a Bosnian student in Sarajevo. Austria soon professed to believe that the attack had been planned with the connivance of Serbian officials or nationals. On July 28 an ultimatum was dispatched to Serbia, making several strong demands, all of which were granted, save two, the granting of which would have been a virtual surrender by Serbia of national standing. England, Russia, and other nations sought to avoid or at least to postpone the conflict; or to keep it within central Europe. Austria refused all conciliation offered by Serbia, while Germany stood ready to abet and assist in event of actual war. Russia intimated that an army would be mobilized the instant that Austrian troops crossed into Serbian territory. Germany warned that mobilization would bring from her a declaration of war, but Russia proceeded with the plans. Too late Austria, at the suggestion of Germany, sought to delay the outbreak of hostilities. On July 31, Russia commanded a general mobilization, and Germany sent an ultimatum to desist, giving but 12 hours for a reply. The answer was a hastening of Russian plans. On August 1, in consequence, Germany and Russia were at war, three days after the official declaration by Austria against Serbia. Also on August 1, Germany demanded of Belgium the free passage of armies across her lands into France. Belgium refused, and on the next day Germany had men in France at Cirey, but did not declare war on France until the following day, August 3. Early on Aug. 4 troops also penetrated into Belgium, whose neutrality Great Britain had guaranteed many years before, and at midnight that day England declared war against Germany.

By October 7, 1917 altogether 27 nations had broken off diplomatic relationship with Germany and her allies, but six of these sent no men into actual conflict. Germany and Austria, called the Central Powers, were joined by Turkey on Nov. 3, 1914 (after Russia had declared war on Turkey), and by Bulgaria on Oct. 14, 1915, after a declaration against Serbia. Though Italy had been a member, with the Central Powers, of the old Triple Entente, she declared neutrality at the start of the World War. Yet on May 24, 1915, Italy cast her lot with the Entente against her former allies. After suffering unprovoked attacks on merchant vessels at sea, particularly by German submarines, the United States finally declared war on Germany on April 6, 1917. The first American soldier regularly enrolled in a United States force in Europe to be killed in action was Corporal James B. Gresham, on Nov. 3, 1917, at Artois, France. He is buried in Evansville, Ind. After much hesitation and internal conflict of opinion, both Greece and Rumania joined the Entente Allies. The countries actually engaged in the conflict were Germany, Austria-Hungary, Turkey, and Bulgaria against Great Britain, Canada, India, Australia, New Zealand, South Africa, France, Russia, Belgium, Serbia, Montenegro, Japan, Italy, Rumania, Portugal, Greece, and the United States.

The duration of the war was four years, three months, and 14 days, ending on Nov. 11, 1918 at 11 A. M. Russia, however, gave up on Dec. 16, 1917; Rumania on May 6, 1918; Bulgaria, Sept. 19, 1918; Turkey, Oct. 30, 1918; Austria-Hungary, Nov. 4, 1918; leaving Germany alone in the conflict. On Jan. 18, 1919, the peace conference began at Versailles, France. Germany agreed to the terms on June 28, precisely five years to a day after the assassination of Archduke Francis Ferdinand in Bosnia. Peace was made with Austria by the Treaty of St. Germain, Sept. 10, 1919; with Bulgaria, by the Treaty of Neuilly on Nov. 27, 1919; with Hungary, by the Treaty of the Grand Trianon, June 4, 1920; and with Turkey by the Treaty of Sevres, Aug. 10, 1920.

Battle Fronts. Today it is next to impossible to conceive the magnitude of the operations during the World War on land and sea. We usually think only in terms of the Western Front. Fighting, however, began immediately on three great fronts,—the Franco-Belgian or Western; the Eastern along the borders between Russia and Austria, Germany, and what is now Poland and some smaller states; the Southern, or along the borders between Austria and Serbia and Montenegro. When Italy joined the Allies in May of 1915, another great front was established on the bounds of Austria and Italy and adjacent territory; later the same year, when Bulgaria joined the Central Powers, another system of operations occurred along the Greek front, north of the city of Salonika. Other regions of combat were along the boundaries of Rumania, Hungary, and Bulgaria, after August of 1916. The operations against Turkey were conducted, for the most part, in Asia Minor, chiefly in Palestine, and in Mesopotamia, now Iraq, along the Tigris and Euphrates Rivers. Allied offenses against German colonies reached considerable magnitude, especially in East Africa, even to the date of the Armistice. Naval operations or bombardments occurred in the North Sea, the Baltic, Mediterranean, the Black Sea, the Dardanelles, off the coast of Chile, near the Falkland Islands, the Cocos Islands, and the mouth of the Rufiji River in German East Africa. Though aircraft was used in scouting and service elsewhere, the main activities were on the Western and other European fronts, with German raids on Paris and other enemy cities and on London and the English coast elsewhere.

The Western Front. Only the most important movements and battles may be treated in a short narrative of the World War. Germany was prepared for large-scale operations with a well-drilled army of 35 corps, 4 cavalry corps, and 25 Landwehr brigades made up of reserves who had already served in the field, all being

divided into seven armies. By the middle of the first great offensive, these were distributed along the front from the coast of Holland to Switzerland. Belgium made a gallant defense, but had only six divisions to oppose the superb German war machine, which was sent through territory supposed to be neutral, rather than directly through France, where the borders were strongly fortified. Belgian fortresses, which some supposed impregnable, soon gave way, that of Liége on August 5, after a terrific bombardment, though some held out for 10 days longer. In spite of inability to hold their fortresses, or their lines in one position, Belgium slowed up the German armies until the French and British could readjust their inadequate military defenses. France provided an initial force of 22 army corps, with 7 cavalry divisions, arranged in five armies that were shifted to meet the points of the heaviest German attacks. Great Britain provided, early in the conflict, six infantry divisions and one of cavalry which detrained on French soil near Maubeuge.

The Belgians, receiving no support from their allies, were forced back on Antwerp. On Aug. 20, the Germans entered Brussels and also appeared before Namur, the last great fortress along the Meuse River before entering France. Launching an offensive in Alsace on Aug. 8, the French under Gen. Pau were halted and again checked on the 19th. Likewise, 19 divisions of the 1st and 2nd French armies were checked in the Battle of the Frontiers at Morhang-Sarrebourg on Aug. 20. France found, as Belgium had, that the German howitzers and other war inventions swept resistance before them. Both sides paused for changes in plans and to take breath, the Germans because their advance had been too rapid, and the French because their miscalculations had put them much on the defensive. The whole line of the Allies fell back, and while the French shifted plans, they became aware of the vastness of the German sweep, and grimly settled down for more determined resistance. Meanwhile, the British took the brunt of the German attack at Mons, where their flanks came near being enveloped. Near Charleroi also, the German attack was terrific, with tremendous losses on both sides.

The German armies pursued the French and British across the Somme River, but by so doing drove them into more strategic positions. General Joffre, the allied commander, at last saw his opportunity. Following the tactics used with devastating effects in 1870 in the Battle of Sedan, the Germans began a premature circling movement with Paris as the main objective. Joffre swung back his center and left wing, with Verdun as a pivot, and the battle of the Marne gave the Allies their first great hope, while Paris was saved by the quick action of its defender, General Gallieni. (See *Battle of the Marne* elsewhere.) Before the Germans could take full advantage of their success at Mons, Charleroi, La Cateau, and in the fall of the Belgian fortresses, the Allies made a quick counterstroke, forcing their enemy to narrow their plans and make revisions in tactics which lost them the chance for Paris. Meanwhile, they had also weakened their lines at some points on Aug. 25, by sending four divisions to the Eastern Front. After the allied stand at the Marne, following the memorable command of Joffre, "They shall not pass," the Germans retreated beyond the Aisne, where they recovered quickly and began to entrench themselves.

Then followed a series of battles, such as those at the Aisne, the Somme, and at Arras, the results of which were indecisive. The Germans rushed toward the northwest coast, but gained no particular advantage in being nearer England, and not as near Paris as before the Marne engagement. On Oct. 10 Antwerp fell to the German armies, which swept on to Zeebrugge, Ostend, and Ghent. Next followed a series of battles in the region of the Yser River, chief of which, the battle of Flanders, brought the Allies some success, after most sanguinary fighting. From Oct. 31 to Nov. 11, the British gained an important advantage in the battle of Ypres. Germany failed to reach her chief objective, the capture of Calais and Dunkirk, and the Allies held them for the rest of the war in that sector.

Several attempts were made by each side to turn the enemy's western flanks. Trench warfare became a settled mode, since all realized now that open warfare, with modern guns trained on lines of battle, was altogether too costly. Airplanes were used in some engagements to direct the firing of artillerymen who could not detect the position of the enemy otherwise. The stalemate existing as 1915 began continued practically unchanged during all the year. Great battles were fought, incredible numbers of men were sacrificed, but neither side could pierce the opposition lines nor get around them. The Allies made numerous attacks at many points in the solid German front. They sought to keep Germany from sending more men against Russia on the Eastern borders. Falkenhayn, the new German commander on the Western Front, decided at last to fight to a finish there. While the entry of the Turks on the side of the Central Powers hampered allied plans, the final decision was only delayed, while Great Britain sent forces into Asia.

General H. H. Kitchener had collected a huge army of British volunteers, as yet untrained, but later to be of first importance in the third and fourth years of the death struggle. In March the British made an intense bombardment of a 2000-yard front for 35 minutes, followed by laying down a curtain of fire farther back to prevent Germany from bringing up reenforcements. Though taken somewhat by surprise, the Germans were able to collect their battalions because of a long delay in ordering the British advance. In the end the British suffered staggering losses in this offensive, known usually as the battle of Neuve Chapelle. The arrival of the Indian Corps, the 1st Canadian Division, and other territorials raised the British forces to 13 divisions and 5 cavalry divisions. On April 22 chlorine gas was first used by Germany at Ypres, but the leaders failed to take advantage of the consternation produced in the French, Canadian, and other sectors where a four-mile gap was made in the holding lines. The later stubborn resistance by the Canadians won for them the plaudits of the world. Further operations in the spring

and summer of 1915 consisted of various attacks by General Foch of France between Lens and Arras, which netted some territory at staggering cost in men. Haig's first British army likewise attacked at Aubers Ridge, but gained little, yet the attempt was renewed on May 15-27 at Festubert, south of Neuve Chapelle. Up to June 18, the French lost over 100,000 men in their sectors at Lens and Arras, and the push was then abandoned. Then the confident Germans sent more men to the Eastern Front. On Sept. 25 another French and British movement began in Champagne, also at Artois, in the Lens area. Despite the unfavorable opinion by Haig of success, his army was persuaded to attack at Loos. Slight gains were made in most of these offensives, but at a total allied cost of 242,000, compared with 140,000 of the Germans. Up to this time the British had been short of munitions. In May shifts had been made in the British Cabinet, which admitted Lloyd George as Minister of Munitions, and became a coalition ministry. By the end of 1915, 36 divisions had arrived in France, from various parts of the British Empire.

Declaration of a submarine blockade of England by Germany, retaliatory orders by the British ministry, the sinking of the *Lusitania* with a loss of 1195 lives, including 122 Americans, eventually lost for Germany, along with other acts of unrestrained warfare, the sympathy of many nations, and at last caused the United States to enter the war.

Great events on the Western Front in 1916 were the investment of Verdun by Germany in February; the naval battle off Jutland on May 31, followed at once by the third battle of Ypres on land, the loss of the British cruiser *Hampshire* (probably sunk by a mine) with General Kitchener and his staff, and nearly all the crew, in June; and another battle at the Somme in July.

While the theatre of war had shifted to the Eastern Front late in 1915, the allies on the Western Front were able to get their bearings. At a council at Joffre's headquarters in December, including delegates from Russia and Japan, it was decided to open a general offensive at the Somme in the summer of 1916. The Allies had developed a rather effective agency, the blockade of German ports from all directions save the Baltic, and now Germany, in her turn, began to feel the shortage of the sinews of war. The German High Command decided on a series of short pushes, with carefully planned objectives. For the allied nations, General Joffre had requested some of the men and supplies at Verdun, because he thought the forts no longer effective barriers. At this strongly fortified city, the new German offensive began as a surprise on Feb. 21, 1916, in command of the German crown prince. Eventually, the terrain in and about Verdun was battered almost out of recognition. At last General Pétain was sent to that region to learn the true intentions of the enemy. On March 6 the Germans pushed their campaign to the west bank of the Meuse River. Until July 1, they continued to hurl men and huge stores of ammunition upon the forts of Verdun, with appalling losses, admitted by the French to be 340,000 of their men, and probably some less for Germany.

Temporary gains in these advances were all won back by an allied drive in November; so that, by 1916, more territory was actually in French and English possession than in 1915. Meanwhile, the British and French launched somewhat prematurely their Somme offensive on July 1. In this campaign the English tanks were first employed with much success, and they proved afterward a weapon that Germany could not conquer. By the close of 1916, the Allies were superior in aircraft, artillery, and munitions. Realizing that the German plans had not netted any great benefits, the German Chancellor in December put out a vague bid for peace, which President Woodrow Wilson asked him in vain to make definite. Little came out of the situation except a strengthening of the morale of the allied armies.

Despite the increase in the sinews of war, disquieting events confronted the Allies early in 1917. French man-power began to show signs of running low. Italy, since joining the Allies on May 24, 1915, had gained no successes in the campaign against Austria, and Russia showed tendencies to disunion and internal strife. Germany now declared a complete blockade, even against neutral shipping in the North Sea and eastern Mediterranean. Two days later, however, on Feb. 3, the United States severed diplomatic relations with Germany, and at last, on April 6, declared war. General Joffre had retired from the supreme French command of the armies in favor of General Nivelle, who had proved an able strategist at Verdun, but he was destined soon to fail in a major endeavor. The allied forces now numbered about 4,000,000 men, and Germany had but 2,500,000. General Ludendorff, now dominant on the Western Front, ordered the Germans to devastate much of the occupied territory, and to make a retreat to a new series of entrenchments known to the Germans as the Siegfried Line, but to the Allies as the Hindenburg Line, because of the influence of Gen. Paul Hindenburg.

Fighting was resumed on a large scale around Arras, while the British and Canadians, by brilliant charges, captured Vimy Ridge, long an object of attack by both sides. Some French troops began to be restless, and General Nivelle gave way to General Pétain, while Foch was recalled to become chief-of-staff for France. By swift and sudden movements, unheralded as before by artillery preparations, the French took the Chemin des Dames and other positions in October, while the British captured Cambrai during the next month. In this last campaign 350 tanks were used most effectively. On June 26, 1917 American men went into training in France. Italy, however, suffered a crushing defeat at Caporette on Oct. 24. The Austrians then swept on as far as the Piave River on Nov. 9. Late in 1917 Russia virtually withdrew from energetic campaigning. Meanwhile Jerusalem had been captured, the campaign in Mesopotamia proceeded favorably to the Allies,

and in South Africa the Germans were being beaten.

When 1918 began, the Germans, because of the fall of Russia, were able to transfer troops freely to the Western Front. In March of the previous year, Allied divisions numbered 179 to only 129 of the Germans. Eleven months later Germany had 177 divisions, with 30 more at hand, while the Allies could command but 173. Since November of 1917, there had been an allied Supreme War Council constantly in session at Versailles. Thus, almost too late, the Entente nations organized their plans on something like a united scale. During 1917 the Germans had depended on their submarines to choke off allied commerce, and the tale of losses sustained on the seas, month by month, shows how near this campaign came to success.

Once more in March and April, turning to land again for ultimate hope of victory, the Germans launched a terrific offensive on the Somme. Their plan was to drive a wedge between the British and French. General Pershing offered the American troops for use where need should arise. General Foch of France became head of all the allied armies. So great was the progress made at Lys, that General Haig, for the British, commanded that "every position must be held to the last man," with no retirement, as if they were fighting with their backs to a wall. To save their strength, however, the British fell back to a line that extended from Bixschopte to Zonnebecke, not so different from the one they held four years previously for the first battle of Ypres. Again, the Germans also attacked furiously at the Aisne and the Marne. Near Montdidier on May 28, however, the American 1st Division went into battle, and by July over 1,000,000 men had left the United States for France. In June the Germans attacked once more in the Campiègne, but suffered incredible havoc in a ghastly failure. During this month American marines crossed the Marne, and also captured Belleau Wood. On July 15 the Germans were again along the Marne, at a loss of 100,000 men in three days. This virtually ended their last great bid for victory.

General Foch now assumed the offensive. The Americans and French went into action again from Soissons to Château-Thierry, on a front of 28 miles, aided by a huge army of tanks. They captured 35,000 of the enemy and threw the main lines back across the Marne. Foch again struck between Amiens and Montdidier, using the French 1st and British 4th army, and the Germans here suffered their greatest defeat to that time. General Mangin, aided by Americans, struck between Noyon and Soissons, and the United States men on Aug. 30 captured Juvigny. Next came the penetration of the famous Hindenberg line by Horne's British troops, while General Pershing, for the first time, was allowed to organize a complete American army, which on Sept. 16, at St. Mihiel captured 16,000 prisoners and 450 guns. Ten days later the Americans assisted in the Meuse-Argonne operations, the largest battle in which they had appeared. The German communications were cut, and defeat was now assured for them. Byng and Horne, with British and American men, won a battle near St. Quentin and entered Cambrai. On Oct. 9 at Le Cateau, the British advanced, and eventually penetrated the German lines for nine miles on a 30-mile front. Late in September, the rejuvenated Belgian army, under King Albert, joined the offensive. The Pope had made a plea for peace, and President Wilson had offered to negotiate. Terms were given the Germans by General Foch on Nov. 8, accepted on the 10th, and the Armistice began on Nov. 11, 1918. By this time the allied forces had driven the Germans far back toward their own borders. Meanwhile, some of the ships of the German fleet mutinied at Kiel, the German Kaiser fled on Nov. 8, and a new Republican form of government was proclaimed to represent the people.

The Eastern Front. Though Russia deserted the allies cause finally on Dec. 16, 1917, she had been of little aid during that year, even though the provisional government under Kerensky tried to carry out most of the pledges made by the czarist government. During the first three months of the World War, Russia gained some notable victories in both the Austrian and the Polish campaigns. Though the Austrians defeated them in Poland at Krasnick, on Sept. 2, Russia won a great victory at Lemberg, which lost most of Galicia to Austria and on Sept. 22 began to bombard Przemysl. They had already penetrated East Prussia, as far as Konigsberg on Aug. 20. Germany now called Paul Hindenburg from retirement, who administered a thorough beating to Russia at Tannenberg and again at the Masurian Lakes, but Russia won some success in the battles of Niemen and Augustowo. In the following month, Oct. 1914, the Germans began an offensive against Warsaw, and so helped to protect Austria, even though the Polish campaign was not very fruitful. In Feb. 1915, Hindenburg, who had been called to assist on the Western Front, again attacked the Russians in East Prussian trenches. Przemysl fell to Russia in March, but Mackensen battered in the Russian front and drove the enemy to the San River in May. Russian gains were largely lost, notably at Przemysl and Lemberg. By August the entire line had been forced back from the Baltic to Rumania.

During 1915 the Russian armies suffered from inefficiency and mismanagement. In the spring of 1916, troops of the Central Powers were drawn off to fight Serbia, to attack Verdun, and start a campaign against Italy. Then the Russians again advanced westward, broke the Austrian line, took Lush, Brody, and the Bukowina in part. Then troops were taken away to assist Rumania, who entered the war on the side of the Entente. In 1917 the Russians made no particular headway, for their spirit was broken, and the Kerensky government and Gen. Brusiloff, their great general, could do little. Little by little the armies broke up, the Germans captured Riga, and might have advanced, if they wished, on Petrograd itself. Russia signed the Treaty of Brest-Litovsk with the Central Powers on March 3, 1918. Some Czecho-Slovakian soldiers, who had

fought in Russian armies, now tried to escape by going east to Vladivostock, but the Bolsheviki opposed this move. An allied force, in which the United States participated, went to the rescue in Siberia and also tried to conserve the great stores of war material at Vladivostock in July of 1918.

Italian Front. Because the Austrian forces were occupied in the Russian, Polish, and East Prussian campaigns, Italy met with little opposition in the Trentino, the district about the Trent in Tyrol. The Italian army crossed the Isonzo River, and by 1916 had closed the northern frontier. An Austrian attack, however, with heavy bombardment, in the Trentino in May 1916, shattered the Italian defenses. Later the Italians gained some success near Gorizia. In the spring of 1917, operations between Plava and Gorizia became a see-saw campaign between the rival armies. In August the engineers of Italy conceived a daring plan of diverting the waters of the Isonzo at night, while they constructed bridges for the army to cross; in the daytime the river was turned back into its natural course. By Aug. 18 the whole force was able to cross, and by Nov. 1 had taken some strong positions, although failing to capture Monte San Daniele. In October, the Austrians gained great headway in a countermove and administered a stinging defeat upon Italy in the decisive battle of Caporetto. The British and French now rushed to the aid of their ally, General Cadorno was superseded by General Diaz, and by spring Italian resistance had strengthened. In June of 1918, the new command started a counter-drive to offset some Austrian gains. During the summer, Marshal Foch determined it was time to strike. On Oct. 24, aided by five British and French divisions and by the American 332d infantry, he crushed all resistance of the Austrians in battles that became routs for the defeated. An armistice became effective on Nov. 4.

Balkan Front. Including the Rumanian and Turkish fronts in Europe, considerable fighting occurred in southeastern lands. On August 16, 1914 Serbia thoroughly defeated the Austrians who had crossed the borders, expecting a quick and easy conquest. In December the tables were turned when Belgrade fell to the enemy, though the capital was regained for a time by Serbia, two weeks later. Montenegro had joined her neighbor nation at the beginning of the conflict. When the Bulgarians entered the war, Serbia was humiliated with the aid of German and Austrian troops and military strategists. Bulgaria did not love Austria-Hungary, but she hated Serbia for depriving her of some of the fruits in the Second Balkan War. Venizelos, prime minister of Greece, wished to enter the war on the side of the Entente, but the court and the pro-German king were able to thwart the wishes of the Greek people. When King Constantine abdicated, Greece came to the aid of the Allies on July 2, 1917, against Bulgaria and Germany. Under the influence of the Central Powers, Turkey declared war on November 11, 1914 against the Allies and against Rumania on August 29, 1916. This shifted the theatre of some operations into Asia; for Turkey hoped that the Islamic states would join in the holy war which she proclaimed. On the contrary, the Moslems of Africa, Arabia, Egypt, and India favored Great Britain and France and rendered no little aid. Eventually, the leadership of Islam passed from Turkey to the Arabian chiefs.

Rumania cast her lot with the Allies on August 27, 1916 by declaring war on Austria, an act necessarily considered hostile by the other nations supporting Germany. When Bulgaria declared for Austria and Germany on Sept. 1, 1916, Rumania suffered much in consequence. General Mackensen of Germany crossed into the Dobrudja, drove Rumanian troops out of Transylvania, and finally from Wallachia, while Rumanians held only Moldavia of the territory she coveted. Russia after 1916 afforded little of the help that had been promised. Lack of munitions and of leadership forced Rumania to follow Russia in December, 1917 in suing for peace. Toward the close of the World War, Rumania again prepared to resume hostilities, but her army appeared in no battles.

Urged by the threats of Turkey, the Anglo-French fleet and an allied army sought in 1915 to capture the Dardanelles. Then followed the ill-starred campaign in the Gallipoli Peninsula. Here the Anzacs (the troops from Australia and New Zealand) won universal admiration by their heroism and persistence. Between the end of April and December, the British alone lost 100,000 men, with about the same number incapacitated by disease, in a campaign that netted no definite benefits, except to keep some of the Turks busy meanwhile. Some of the allied forces were sent into Asia, but most went to Saloniki in Greece, and did much toward preventing Greece from siding with Germany.

Results in Asia and Africa. Turkey lost heavily in the World War. The main military operations outside Gallipoli centered in Armenia, Palestine, Mesopotamia, and Egypt, all of which were finally cut off from the influence of Turkey. In 1915 Russia penetrated as far as Erzerum, today the capital of a Turkish vilayet, and the sultan sent some troops into Russian territory. Little came of these expeditions. Meanwhile, Russia unsuccessfully attempted to rid Persia of Turkish influence, though her armies in 1916 got as far as Lake Van. Great Britain sent an army up the Tigris River, in the hope of taking Bagdad, but General Townshend was besieged at Kut, forced to surrender with all his army there (10,000 men on April 29, 1916) after holding out for 143 days, and Townshend became a Turkish prisoner. A new force, composed in large part of Indians, captured Bagdad in March of 1917. After nearly a year of preparation, including the making of a railway and water line across the Sinai Peninsula, the British gradually drove out the Turks from Palestine and captured Jerusalem on Dec. 10, 1917. This city of Christianity, after about 700 years, now was again in Christian hands. Meanwhile, Great Britain had gained the confidence of the Arabian tribes, which severed all connection with Turkey as a military and especially as a religious

leader of Islam. So completely was the sultan humiliated in Asia that he sued for an armistice, which became effective on Oct. 31, 1918. Thus indirectly the Allies accomplished what had been the objective of the ghastly failure that overtook them at Gallipoli. Four new nations were organized, including independent Egypt, Iraq, the Hedjaz, and Palestine under British mandate.

German colonies lost during the World War were Togoland, the Pacific islands, where resistance was almost negligible. In Southwest Africa, however, forces from British South Africa required seven months to conquer the German colonies. In the Cameroons, French, British, and Belgian companies from nearby lands, began a land and naval program (using small river boats) in 1914, and in 1916 the last of the German forces were driven into the Spanish Guinea. Resistance in German East Africa was even more stubborn, requiring at first local troops, then in 1915 more from India, and at last reenforcements from South Africa under General Smuts. Afterward native soldiers carried on the campaign under great hardships. General Vorbeck, the able German commander, was permitted by terms of the Armistice to make an honorable surrender three days after firing ceased in Europe. Kiaochow, on the south side of the Shantung Peninsula, ceded for 99 years by China in 1898 to Germany, was taken by Japanese forces, assisted by the British, after a campaign lasting from Oct. 16 to Nov. 7, 1914. China was again given sovereignty by a Sino-Japanese treaty in 1922.

Naval and Air Engagements. Except for the effective aid by the submarines or U-boats the German navy accomplished little during the World War, save by some spectacular raiding. Allied navies were able to keep open the lanes of travel. In spite of some losses, troops were carried in comfort and safety from all parts of the world to the battle fronts of Europe, Asia, and Africa. More and more the Central Powers realized the force of the allied blockade, first as to munitions only, then as to raw materials for war, and finally as to foodstuffs. During the early months of 1918, a huge mine barrage was laid in part of the North Sea, and in May this was continued by an American mining squadron. This was a tremendous help in choking off the German submarine campaign, which all but crippled British shipping. On April 22-23 a gallant attempt was made to block the canals at Ostend and elsewhere to prevent the U-boats from coming into the open waters. In response to the effective allied control of the seas, Germany issued decrees for a "paper blockade"; that is, a declaration that the North Sea was a war zone, into which no ship of any nation should enter. Not even German submarines, however, could enforce such a decree, which was contrary to international law, unless it could be actually enforced.

Naval Engagements. Several major naval battles occurred, but they fall into insignificance in comparison with the stupendous land operations on several fronts. On May 31, 1916, the heaviest battle on the seas was fought off Jutland, when the British squadrons caught up with the entire German battle fleet, and, after a battle in three phases, drove them back into their harbor under shelter of darkness. The Germans lost 11 out of 110 craft of all sizes, with 2,863 men; the British lost 14 out of 149 ships, with 6,617 men and officers. On Aug. 16, 1916 once again some of the German High Seas fleet came out, sank two British cruisers, but in turn suffered a loss of two submarines. Never after that did the German major warships emerge into open waters, until they came out to surrender as required by terms of the Armistice. Earlier battles were those in the Bight of Heligoland on Aug. 28, 1914, when three German cruisers were sunk, and a British flagship was damaged; and at Dogger Bank, on Jan. 14, 1915, when the Germans lost one cruiser, and the British flagship was badly damaged. Naval operations in the Dardanelles campaign, 1915, like the land, resulted in disaster for the British and French; for, out of 16 ships engaged, six were disabled, with the loss of complete crews in the two cases, and a French submarine was destroyed, while only one Turkish ship was wrecked. One great loss to England was the loss by a mine of the cruiser *Hampshire,* June 5, 1916, with Gen. H. H. Kitchener (Lord Kitchener of Khartoum) and his staff, and all the crew. The first warship to be sunk by a submarine was the British light cruiser *Pathfinder* by the U21 on Sept. 5, 1914. The U9 late in the same month sank three armored warships within an hour with a loss of 1400 men. The *Lusitania,* largest passenger vessel sunk, on May 7, 1915, caused a world-wide wave of horror. Before America entered the World War, 226 of her citizens had died because of submarine attacks. For a time the Germans boasted that the submarine would stop the sending of United States troops to Europe; and for a time also it looked as if they would make good their boast. Altogether 278 undersea boats were destroyed in the World War, of which 205 were German, a record that shows the effectiveness of the allied plans when they were at last completely put in operation. German raider ships for a time caused much uneasiness and considerable loss. The *Moewe* escaped from the British blockade in December of 1916, and in several months sank 27 British merchant vessels. The cruisers *Goeben* and *Breslau* bombarded some seaports in Algeria in August of 1914, and were afterwards sold to the Turks. Much submarine activity, notably on the part of the Allies, occurred in the Adriatic Sea, but few craft were lost. In the Baltic the Russians held back a German fleet on July 2, 1915. Turks bombed Russian ports along the Black Sea, and Russia sank some of the sultan's ships in turn. Most spectacular were the raids of the cruisers *Emden* and *Königsberg.* The former sank or captured some 30 vessels before she was sunk off the Cocos Islands; the latter, after doing much damage, was sunk by British monitors off German East Africa. Outside of European waters, the greatest naval engagement was fought off Chile on Nov. 1, 1914, at which time

three British cruisers went down, with considerable loss of life. One month later a British squadron completely destroyed the German ships. In both cases the defeated admiral went down with his flagship.

Aircraft played an increasingly important role as the war progressed. The first British air squadrons flew from Dover to France on Aug. 13, 1914. They were unprovided with machine guns and bombing racks. From the first airplanes were used to sight enemy movements; and on Aug. 23 the news of the concentration of Germans for a great drive permitted the British troops to fall back to better positions. Before the battle of the Marne, similar warning was given by aviators. On the previous day, one German plane was chased from the vicinity of the Maubeuge airdrome, and two days later, Aug. 24, the first German machine was forced to land in Allied territory. In January of 1915 the Germans made airraids on Dunkirk; and, on the 22nd, 13 machines in formation dropped bombs on the docks there. In May the Fokker monoplane was modified to permit firing of a machine gun between revolving blades of the airplane, a great surprise for the Allied aviators. On Feb. 21, 1916 the French began to fly over enemy lines to prevent German planes from flying over allied positions. The British opened the battle of the Somme by airplane bombing attacks. In 1917 the Handley Page airplane was first able to cope with German superior forces, and on June 6, 1918, an independent allied air force was organized to bomb munition caches back of the main German lines. On a smaller scale such raids had been made some time earlier. Airplanes of the British navy patroled the English Channel when troop ships were crossing. Navy planes also bombed the Zeppelin bases at Cologne and elsewhere. From 1915 on, planes were able to rise from the deck of the British *Vindex* and other craft. The Germans bombed London and Paris from the air, the coasts of England, France, and Belgium, killed many people at church in Paris, but nothing else was gained save frightening and killing defenseless civilians. The German long-range gun, called Big Bertha in France, accomplished only a similar result. When the United States entered the World War, she had but 55 inadequate aircraft. The Allies supplied 3800 planes for American use, helped to train aviators in Europe and on this side, while a great number of volunteers from America fought in British and French air units. Finally, the United States was represented on four fronts by 1200 pilots and by 1000 observers in balloons and airships. America shipped to Europe 1885 of one type of airplane, but the greatest aid was the development of the Liberty motor, of which 4435 were shipped to France for use of United States pilots and 1025 for the Allies.

SUBSISTENCE SENT OVERSEAS TO THE ARMY OF THE U. S.

Bacon	147,956,223 pounds
Beef (frozen)	250,584,692 pounds
Beef (tinned)	140,843,476 pounds
Flour	542,874,797 pounds
Tobacco	27,449,645 pounds
Cigarettes	2,439,260,097 single
Sugar	160,180,225 pounds
Butter	16,200,797 pounds
Tomatoes	100,081,789 pounds
Coffee	39,135,167 pounds
Milk	42,922,743 pounds
Beans	39,646,677 pounds
Candy	7,895,053 pounds
Rice	25,466,547 pounds
Prunes	15,748,931 pounds
Salt	13,707,276 pounds
Oatmeal	4,661,732 pounds
Peas	4,689,425 pounds
Peaches	2,415,182 pounds
Cornmeal	16,074,678 pounds
Hard bread	27,978,830 pounds
Total cost of subsistence	$327,059,997

THE UNITED STATES IN THE GREAT WAR.

Total strength of the army Nov. 11, 1918	3,703,273
Number of fighting men in Europe	1,949,316
Supplies sent to Europe for the army.	4,897,660 tons
Rounds of artillery ammunition	9,066,420
Rifle and machine-gun ammunition (rounds)	1,629,300,000
Rifles	1,800,000
Pistols and revolvers	615,000
Machine guns	49,350
Grenades	1,745,000
Blankets	19,419,000
Coats	7,294,000
Overcoats	7,748,000
Shirts	22,198,000
Shoes	26,423,000
Stockings	89,871,000
Undershirts	69,764,000

CASUALTIES IN THE ARMY OF THE U. S.

Dead, from all causes	105,284
Killed in action	67,813
Wounded	191,000
Taken prisoner	4,912

MONEY COST OF THE GREAT WAR (ESTIMATED).

United States	$32,080,266,968
Great Britain	44,029,011,868
France	25,812,782,800
Germany	40,150,000,000
Austria-Hungary	20,622,960,000
Russia	22,593,950,000
Italy	12,313,998,000
Belgium	1,154,467,914
Serbia	399,400,000
Rumania	1,600,000,000
Canada	1,665,576,032
Australia	1,523,208,040
Greece	270,000,000
Japan	40,000,000
Turkey	1,430,000,000
Bulgaria	815,200,000

Explanation: The enormous expenditures of the U. S. are due to the fact that this country was compelled to build its military organization from practically nothing. Also, prices of everything in the U. S. reached their peak in 1917 and 1918. The war debt of the Central Powers was wiped out by the disappearance of the German mark, the Austrian kronen, and the Russian ruble as money. The decline of the currency of all other European states enabled these states to repay some of their indebtedness in cheap money. Thus, maintaining the dollar at par was in one sense a costly thing for the U. S.
Attention must be called to the fact that this table merely represents the actual expenditures for war, and does not include losses resulting from the destruction of property. The disarrangement of business due to war conditions can never be more than approximated.

Total cost estimated variously from $208,305,000,000 (low) to $330,000,000,000.

COLONIAL HISTORY

Today we wonder why Europeans were so long in finding the western hemisphere. The reasons are varied and interesting. Until population began to increase faster than the available supplies of food and other products, men were content to remain within narrow areas. Again, the knowledge of other lands was usually vague and forbidding. Even Ptolemy, the greatest Egyptian scientist of the second century of our era, thought that the Indian Ocean was an inland sea, that Africa somehow was attached to China, and that the western ocean offered difficulties beyond the skill of navigators. The great Roger Bacon in England, as late as 1275, knew hardly more of geography than a pupil in the fifth grade does today. Further, the imaginations of men filled the seas with hideous monsters, the distant continents with fierce cannibals, and the stretches beyond Africa with the Great Sea of Darkness, mysterious, hazardous, terrifying. Later the urge for land, for adventure, and inevitably for treasure—in terms of the gold and precious stones of fancy—forced men out of their reluctance to brave unknown oceans.

North America may have been visited by a Buddhist monk, who left a report that he, about 499, saw a spacious land far to the east from his native India. His description fits Mexico, and possibly explains the presence of the cypress trees in California, where they are not native. Eric the Red founded colonies in Greenland in 985; his son, Leif Ericsson, sailed westward to what he called Vinland, variously identified in recent times as Nova Scotia, Labrador, or the coasts of New England.

Knowledge of Asia was nearly as indefinite as knowledge of America until after 1200, when a monk of Naples wrote the first authentic account of the court of the Great Khan of Tartary. Two brothers of Venice, the Polos, with their famous nephew, Marco, spent some years at the court of Kublai Khan of China, and one or more of them went to Cipango or Japan before returning to Europe by way of India.

By 1300 the navigators of Italian cities, Spain, and Portugal sought new riches abroad, lands for exploitation, and opportunities to spread the Christian faith in opposition to Islam. Portugal opened a large trade with England. By 1400 under Prince Henry of Portugal, extensive trade flourished with the north African coasts. His men in 1415 took Ceuta from the Moors, set themselves up at Sagres, and pushed down the western shores toward the equator. This was the beginning of the Portuguese colonial empire. After 1430 the Portuguese had a monopoly of the African slave trade until Spain and England took it up. In 1455 the Cape Verde Islands were discovered, in 1486 Diaz rounded the Cape of Good Hope, and in 1498 Vasco da Gama crossed the Indian Ocean to Calicut.

Following the Crusades also a flourishing caravan trade sprang up between Europe and Asia. Ocean trade challenged this, and by 1515 the commercial domination of Venice in the east began swiftly to decline. Men still longed to find a cheaper and shorter way to the wealth of the Indias and of Cathay, as China was long known. By 1460 sailors had visited the farthest islands of the Azores, one-third the distance across the Atlantic. It was inevitable that they should very soon penetrate farther.

Discovery of America. So the stage was all prepared for a man like Columbus,—a man of energy, persistence, and great faith. He was familiar with the chief books on navigation, three of which he mastered in detail. These were the *General History and Geography* of Sylvius, the *Imago Mundi* of d'Ailly, and the *Travels* of Marco Polo. Within eight years after Vasco da Gama found the ocean route to India, Columbus at last set sail from Spain for the western voyage. Whether his main motive was to locate a new route to India, or to follow vague traditions as to western lands, is not entirely clear. That he had tried to obtain a commission in Portugal seems proved. That Isabella of Spain also hesitated seems certain, but she finally sponsored his expedition, after Columbus actually had started for the court of France and had sent his brother to England.

Columbus and his friends contributed an eighth of the expense for the voyage, while Luis de Santangel lent the treasury of Castile the share which Isabella and Ferdinand had promised, the total cost being about $100,000.

The fleet of Columbus consisted of the *Santa Maria, Pinta,* and *Niña,* with a crew of 100 men. They embarked from Palos, Spain, on August 3, 1492, touched at the Canaries for supplies, and by sailing due west in good weather arrived at an island on October 12. Columbus named it San Salvador, the name now being Watling. On this and his three subsequent voyages, Columbus explored much of the coast of what is now Central America, one point near the Orionoco, and Cuba. Some assert that he believed, at least for a time, that Cuba was Cipango or Japan. La Costa, his pilot, about 1500 issued a map which looks like some of the ancient ones of eastern Asia about Japan, but he used no names for the coasts, a fact which may indicate that he was in doubt. Until further explorations in the 16th century, it is probable that most Europeans believed that the lands touched upon by Columbus and later explorers were groups of islands. (For further details of Columbus, see article on him in dictionary of Biography under *Scientists.*)

Within a generation the interests of several nations were in conflict in the new world. Columbus claimed the territory for Spain under the terms of his commission, which failed to mention India. For over a century the pope gave grants of lands in America to those who would promise to spread the faith among the aborigines. In 1494 Spain and Portugal entered into an agreement, which determined much of future history. By drawing a line in the Atlantic, certain spheres for conquest and settlement were assigned, and Portugal at last claimed Brazil under this agreement. One object of the Magellan voyage to the Pacific around South America was to see if the Spice Islands fell within the areas which the popes had granted to Spain. The Philippines went to Spain in 1750, but the Dutch, English, and French always objected to agreements between

Portugal and Spain and to all arbitrary grants. To oppose claims to lands in the east, the Dutch East India Company was organized in 1602.

Spain in the New World. Columbus left 44 of his crew in Haiti or Española, as he named the island, but the native Indians soon killed them. On a later voyage he settled over 200 colonists there. Very soon settlements sprang up in the West Indies, and also on the continent. Economic conditions in Europe were bad, and class rivalries drove many to seek wealth of a new home in America.

Juan Ponce de Leon, then governor of Cuba, in 1512, discovered and named Florida, but the Indians killed him on his second visit nine years later. No permanent settlement was planted until the founding of St. Augustine, in 1565, said to be the oldest town in continental United States. Balboa, a bankrupt Spanish noble, sought treasure in Panama, crossed the isthmus, and discovered the Pacific in 1513. Then followed a long succession of treasure hunters. Among the earliest was Pizarro, unscrupulous and cruel, who captured the Inca of Peru, put him to death, and carried off much of the wealth the natives had collected during centuries. Cortez, in 1519, took the ruler of Mexico, Montezuma, but the Spaniards sent a governor to supersede him in civil affairs. Narvaez left 600 men in Florida, but only one was left to escape with the tale of failure. De Soto in 1539 came with a fleet of nine ships, and 1000 men, with complete equipment, wandered from Florida westward and discovered the Mississippi above the delta, penetrated into Texas, but later died and was buried by his men near the Father of Waters. Coronado, another adventurer, came from his governorship at Campostella, Mexico, to seek the "seven cities of Cibola," in what is now New Mexico, but found only some Indian villages, which he destroyed, without locating the famed "palaces of ivory" which he sought. Before the close of the 16th century, Spain had sent more than 150,000 men to America, and they had tried to plant about 200 settlements.

California was visited by the men of Coronado about 1541, by Cabrillo, and Ferrelo two years later, by Vizcaino in 1602, and by others. The Jesuits came to Lower California in 1697, but not to Upper California before 1745. San Diego was visited and San Francisco Bay discovered in 1769. Then the Franciscans founded 21 missions in California, many of which prospered for 50 years. They furnished settlements to the southward with many products, such as wool and fruits. Upper California was constituted a separate province in 1804, remained loyal to Spain during the revolutions of 1811 in Central and South America, and was given representation in the Mexican congress in 1813. From this time the missions began to be secularized. Governors came and went, some of them being expelled by angry natives.

French Explorations. Verazzano, born near Florence, Italy, was commissioned by Francis I of France, and in 1524 skirted much of the coast from North Carolina to New England. He claimed all of this vast region in the name of France, a chief cause of the century of conflict with English settlers. Francis I sent Jacques Cartier on two voyages in 1534 and 1535, who explored the coast of Newfoundland, and went up the St. Lawrence to Hochelaga, the Indian site of Montreal. In 1541 both he and the Sieur de Roberval, a French knight, tried to make settlements in New France. Cartier soon returned, but Roberval went as far as the modern Quebec, yet failed to locate the "diamants" and "golde ore" he desired. Reduced to starvation, the survivors returned to France in 1451. So ended the first French attempts to gain a foothold in America.

Twenty years later Huguenot refugees from France, under patronage of Admiral Coligny, came to an island near the present Beaufort, North Carolina. Their commander left them there, and the remnant tried to work their way across the Atlantic in a small boat. After they had eaten one of their number, and some had died of hunger and thirst, the remainder were rescued by an English ship. Two years later, April of 1564, the same commander established a colony on the St. John's River in Florida. Nearly all were massacred by the Spanish. The few who returned to France obtained no help from the government, and the Chevalier De Gourges, at his own expense, sent an expedition of revenge, in 1568, and joining with the Indians of Florida nearly exterminated the Spanish colony.

Not until 1603 did France gain a foothold in what is now Canada. Meanwhile, a settlement on Sable Island on the Bay of Fundy, after five years, gave up. So also the fur trading post at Tadoussac on the lower St. Lawrence. Other ventures afterward prospered, of which the chief were some of the posts established by Samuel de Champlain, who had come out in 1603, with the expedition of De Monts. Champlain founded Quebec in 1609, where only eight of the original 28 settlers survived a year. He assisted the Algonquins and Hurons on an expedition against their enemies, the Iroquois of New York. On this journey he found the lake that now bears his name. His move against the southern Indians proved a great embarrassment later to France, for the Iroquois took the side of the English in the struggle with France. Champlain made other voyages down the Canadian rivers, and his associate, Nicolet, went as far as Sault Ste. Marie. No trace, however, was found of the great river which they thought emptied into the Pacific.

The era of Jesuit missions, from 1625, is one of great heroism, fortitude, and faithfulness almost without parallel in the new world. The fathers toiled in heat and cold, among unresponsive Indians, and without hope of reward in this world. Some of those who should be better known were, Le Jeune, who established the parent mission at Quebec in 1642; Maisonneuve, a layman, who helped a Jesuit and 37 settlers establish Montreal in the faith in 1642; Alouez, who in 1665, placed the mission which later flourished under Marquette near the western end of Lake Superior. Laval in 1659 became first resident bishop in Canada.

Better known were Joliet and Marquette who journeyed down the Fox and Wisconsin Rivers and across to the Mississippi, thence down to

the junction with the Arkansas, and across by the Illinois and Chicago Rivers once more to Lake Michigan. Marquette labored among the Illinois Indians, and died near the site of Ludington, Michigan, on his return journey to Quebec.

La Salle, another intrepid French explorer, erected forts at Niagara Falls, where Peoria now is, and at the mouth of the St. Joseph River. His men explored both the upper and lower courses of the Mississippi. La Salle himself saw the mouth of the river, and in 1684 came back from France with 400 settlers. They missed the entrance to the Mississippi delta, went on along the Texas coast, then inland, and back toward the east, where La Salle was killed by some of his party near the mouth of the Brazos River. The final results of the explorations, and of the religious colonies planted by the Recollet and the Jesuit priests, was the claim of France to Canada, the regions about the Great Lakes, and that vast inland empire later known as the Louisiana territory. (See index for articles on Cartier, La Salle, Marquette.)

English Explorations. England was only slightly behind Portugal, Spain, and France in laying claim to territory in the new world. Like these other countries, the English called upon another Italian to direct their searches in North America. He was John Cabot, a native of Genoa, but a citizen of Venice. With a single ship and but 18 men, Cabot set out from Bristol, England, in 1497. He reached Newfoundland, explored the coast as far south as Maine, like the rest, sought a passage to Cathay, and returned the next season to England, with a complete report, specimens of what he thought golden ore, and a claim to the entire region in the name of England. After 1502 fishing expeditions followed his course to Newfoundland.

In 1553 some London merchants organized the Muscovy Company, which soon sent Willoughby and Chancellor to find a northeast passage to the orient. Willoughby perished, Chancellor continued north of Russia, and finally on land came to Moscow, where he opened trade. The Eastland and Lavant companies later had posts in the Baltic and Mediterranean basins.

Then followed the age of the Elizabethan sea-dogs. William Hawkins visited the coast of South America. In 1502 his son, John, brought the first slaves in an English ship from Africa, and so established a trade that broke the Portuguese monopoly. Ten years later Francis Drake, a nephew of Hawkins, began to make reprisals on Spanish ships and settlements. (See Privateers in index.) In 1577 Drake captured some Portuguese and Spanish galleons off the African coast, then crossed the south Atlantic, where one of his ships got through the Straits of Magellan. He continued up the western coast, plundering as convenient, refitted the ship in San Francisco Bay and claimed this coast for England under the name of New Albion. Then he sailed eastward across the Pacific, the Indian Ocean around Africa, and so completed the circuit of the globe. Since Magellan himself had been killed in the Philippines, Drake was the first navigator to circumnavigate the world.

After years of agitation, Martin Frobisher at last secured the aid of a member of the Muscovy Company. Two of his vessels reached Labrador in 1577, coasted along Baffin Land, and entered the bay now called by his name. Two other expeditions failed to locate the gold they sought, but the Queen meanwhile had allowed the Company of Cathay to be formed to hold all lands that might be discovered. In 1578, however, Sir Humphrey Gilbert, half-brother of Walter Raleigh, obtained a six-year monopoly of treasure and trade in America. His first fleet was twice dispersed by storms. His second, 1583, reached Newfoundland, with five ships, the largest of only 200 tons, and the smallest a speck of 10. Compare these, if you like, with the *Normandie* or *Queen Mary* today, huge palaces of 80,000 tons. Near the Azores, Gilbert and all the crew of his ship, the *Squirrel,* were lost. His dying remark is said to have been, "It is as near to heaven by water as by land." John Davis, sponsored by Raleigh and others, made voyages and explored the south shores of Greenland, discovered the strait that bears his name, but failed to locate the route to the Pacific. For other voyages to find the northwest passage, see article on *Arctic Explorations.*

Early English Attempts at Colonization. Gilbert found the north latitudes too bleak for planting a colony in what is now Newfoundland. Raleigh (late in life he spelled his name Ralegh) in 1584 received a patent to explore, conquer, and settle men in the Americas. England now thought of competing with Spain in colonization as well as in commerce. Of Raleigh's three expeditions, the first was commanded by Amadas and Barlow in 1584. After visiting the Canaries and the West Indies, this group landed at Roanoke Island, claimed all the coast in the name of the queen, calling it Virginia. In the following year Grenville took out the colonists, but in 1586, a supply ship returning to Pamlico Sound found that Sir Francis Drake had rescued them some months before. In 1587, with John White as governor, an expedition of about 160 men and women, formed a settlement on Chesapeake Bay. White was obliged to return to England on business for the colony, leaving 89 men, 17 women, and two children (one of them, Virginia Dare, his grandchild) to maintain the post. When he returned in April of 1790, no trace of the colonists was found,—a mystery not yet explained, and perhaps never will be unless by access to Spanish archives.

Raleigh himself next turned attention to the fabled city of Manoa, supposed to be a rich Indian kingdom along the upper courses of the Orinoco and Amazon Rivers. In 1594 the region was explored vaguely by men under his patronage. In the following year he came with an expedition, ascended the Orinoco some distance, but was taken ill, and did not leave the ship. His son was killed by hostile natives, supplies ran low, and the city of Manoa faded into the distance. Raleigh thus failed to redeem his promise (he virtually bet his life against fate), and the rest of his days were spent in restraint.

Incitements to Immigration. Before peace was finally concluded with Spain in 1604, the English made no lasting settlements in Asia, Africa, or the Americas. The day of permanent colonies was at hand, however, and the mere voyage after spoil or treasure was to be abandoned. Little arable land remained for sale in England, while tenants complained of their high rentals, and landlords of their poor returns. Men began to find that the towns lacked means of livelihood. Commercial companies began to flourish with the object of getting men somehow to the new world. Even preachers in the pulpit urged their flocks to emigrate to America, where, as one of them said, could be found "whatsoever commodity England lacketh." Somehow the actual settlers did not find it so easy even to subsist, to say nothing of having what home before had not provided.

Richard Lane, governor of the ill-starred colony at Roanoke, wrote to Hakluyt, author of the *Principall Navigations,* that the new land was "the goodliest and most Pleasant Territorie in the whole world." The sad history of Roanoke and of many other early colonies seems to belie this advertisement. Yet Hakluyt himself, in his monumental book, acted as advance-agent for early American colonization. Various schemes were afoot to provide free or reduced transportation either for men without money, or for those who found the laws of church and state too strict for them. Many of the early references to America show a curious mingling of the pecuniary motives with the religious. With the investment of new capital by the merchant "adventurers" in England, real progress began.

Other Exploratory Voyages. After the Gunpowder Plot in 1605, certain prominent Roman Catholics sought to found a colony in Virginia. George Weymouth, a skilled captain, who already had been with an expedition to find a northwest passage, crossed by the route to the Azores, thence to Nantucket and on to Maine because unfavorable winds prevented them from going south to the Virginia shores. He remained a month, exploring and studying the conditions for settlement, and took back to England five natives, as described in Rosier's *Relation* by a member of the party. Plans to found a seignory, with Weymouth as "lord paramount" in Virginia, never came to anything. Resulting from these and other plans, in 1606, two Virginia Companies (one for London and another for Plymouth) were incorporated, laying claim to all territory between 34° and 45° north latitude,—from Cape Fear River to Maine. The London or South Virginia Company was to settle land as far north as the Hudson River; the Plymouth, or North Virginia, from there to about where Bangor, Maine, is now located. The sponsors were Sir John Popham and Sir Ferdinando Gorges.

In August of 1606 the Plymouth Company sent out *Richard of Plymouth,* with Henry Challons as commander, to make "farther discovery of the coasts." Going to the south, contrary to orders, the crew was captured by the Spanish near Puorto Rico, and most of them went to the galleys. Another ship that same year reached the coast of Maine. In 1607 George Popham commanding the *Gift of God* and Raleigh Gilbert the *Mary and John,* joined each other in the Kennebec River in Maine on August 7; entered the Sagadahoc; heard a sermon by the chaplain; and actually started a colony by erecting a fort, storehouse, church, and some fifteen dwellings. Half the original settlers returned on the *Gift of God* later that season, the winter was most severe, some of the buildings burned, and the inhabitants were "temerous" as Gorges wrote, and, when the *Mary and John* came back the next year, all insisted on returning to England. So ended the venture. It was, however, a forerunner of the coming of the Pilgrims to Plymouth in 1620.

Colonial Grants. Men like Cabot, Gilbert, and Raleigh received general patents from the crown. James I in 1606 chartered the London or Virginia Company and the Plymouth, the latter of which failed to make any permanent settlement in America. Colonies were either chartered or proprietary. *Charters* were given to individuals, companies, or corporations that sent out emigrants, and for a time ruled the affairs of the colony, either directly, or by a deputy or governor. Virginia, Plymouth, and Massachusetts Bay were chartered to the London Company. Within 20 years Plymouth bought out the original company in London, and then received a definite grant. Until after 1660, local government was left largely to the companies or the colonists themselves, with some friction between America and England at times. Proprietary colonies were grants to individuals or families, as in New Jersey, Maryland, and Pennsylvania. In Maryland land was leased, in New York rented, and in Pennsylvania sold. New Hampshire and New York were for a time royal English provinces; so were the Carolinas. Rhode Island and Connecticut were each made up of four units, partly grants from Massachusetts and partly from the English crown. New Haven was a theocracy, or religious establishment.

Virginia, "The Old Dominion." Three ships from England, bearing 144 emigrants, sighted the Virginia capes on April 26, 1607, four months before the settlement at Sagadahoc, now Popham Beach, Maine. The new colonists were to remain English, to yield one-fifth of the metals to the crown, to seek a way to the "South Sea," to establish the Episcopal Church, and to hold their goods in common for five years. On May 13 the 105 survivors founded the first permanent colony of the English in America on the James River, thirty miles from the mouth. Only 38 remained when new supplies arrived in January.

New men and goods arrived in October, buildings were repaired, and John Smith obtained something like an orderly government. Indians at first were not hostile, but made frightful attacks in 1622 and 1644 on the planters of the James and neighboring valleys. When the London "adventurers" (those who had sponsored and paid for the expedition) found that Virginia did not pay them, the company turned the government over to the crown. When Lord De la Warr appeared as governor in 1610, Jamestown had 50 to 60 houses within a stockade, one church erected by Smith, and a strong

fort. Men were divided into companies of 15 each, after they had learned that they must earn their bread, crops were regularly planted, and Sir George Somers was sent to Bermuda to get some supplies not obtained in England. Within a few months, however, 150 colonists died, and Lord De la Warr, who had been a good governor, was driven to England by his own illness.

For the next 30 years Virginia survived many changes and trials. The colonists frequently quarreled, discipline at times was too relaxed, the Indians proved a menace when the settlers encroached on their lands and shot their game, and the government at home knew too little about conditions to be of much service.

Tobacco became a staple and a problem in the colony. John Rolfe is given credit for teaching the settlers the lesson of cultivation as he obtained it from the Indians. Before 1620 the king made tobacco a crown monopoly, while planting was forbidden, in England, and importation was curtailed. From 1623 to 1627 the London Company was allowed to import tobacco on payment of a duty of nine pence a pound. Except for the building of ships and homes, making of farm implements, and household necessities, there was little manufacturing in the colony. Conditions improved after 1630, when Governor Harvey encouraged the planting of other crops than tobacco, and when new settlers, real artisans, women and children arrived from England. Establishment of individual holding of lands, and aids to planters in form of seeds and livestock, did much to put Virginia on a self-sustaining basis.

First Representative Government in America. For the first two years affairs in Virginia were managed by a local council of 13 persons, they to elect their own president. At first John Smith was excluded, because of alleged mutiny on the way to America, but he was admitted later and assumed leadership. In 1609 the sponsors in London objected, a new charter was granted with 56 incorporators and 659 stockholders, but the government was vested in a council, which could send to Virginia any governor it chose. The governor was to have absolute authority, and Dale, deputy to Lord De la Warr, proved a stern autocrat. In 1612 the Bermudas also were granted to the new London or Virginia Company, but George Somers two years later bought the rights and organized a company, which at last in 1684 was condemned of irregularities, and Bermuda became a royal colony. The third charter of 1612 gave much of the management to the stockholders in London, and one share of stock was valued at 12 pounds and 10 shillings. In 1624 the charter was annulled.

House of Burgesses. In 1619 Sir George Yeardley took office as governor of Virginia. Before he came from London, a plan for a democratic government had been formed, perhaps at the suggestion of Sir Edwin Sandys prominent in the council of the Company. Yeardley was commissioned to assemble once a year two members from each "corporation" (borough or separate division of Virginia) to carry into action "those things as might best tend to their good." Restrictions and tasks imposed by deputy governor Dale were to lightened. Dale had made the colonists work like slaves. Thus began the famous Virginia House of Burgesses, first representative assembly in America, similar to the House of Commons. The House could originate bills, act as a court in reviewing decisions of county courts, but the governor and council had the power to veto. This mode of government remained essentially unchanged until the end of the colonial period. Except for women, children, and indentured servants under 17, all persons seem to have been allowed the franchise. During the same year the first 20 negroes were brought in for domestic and other service.

Growth of Virginia. Between 1606 and 1630 about 5650 persons came to Virginia. Previous to 1619 there were few women in the colony, but soon several ships brought over a large number, who married the planters, each of whom paid 120 pounds of tobacco for transportation of his bride to America. In the last years of the Virginia Company, a considerable number of poor children, indentured servants, and some felons came from England. Large estates began to grow up from the early years at Jamestown. In 1622 the Indians massacred 350 inhabitants. Sickness and famine often cut down the numbers. Of the 1800 who came between 1606 and 1618, only 600 were living there in the latter year. Over 1200 died between that time and 1624. By 1648, however, the population had grown to about 15,000. In 1625 some 19 settlements existed, the largest being Elizabeth City with 257 people, while Jamestown had but 33 houses and 175 inhabitants.

Virginia after 1641. By the end of the first period of her history, Virginia was made up of planters, quite a few representatives of noble families, some men from the English universities, and a large portion of indentured persons and servants. Virginia took the side of the cavaliers during the Commonwealth in England. Sir William Berkeley, who became governor in 1641, surrendered to a fleet sent over by Cromwell in 1652. With the English Restoration, Berkeley returned to his post, soon began a series of repressions, the franchise was limited to freeholders, taxes became burdensome and the king in 1669 and 1773 granted parts of Virginia to individual favorites. During Bacon's rebellion, caused by these and other acts, civil war ensued, and Jamestown was burned, when the governor refused permission for Bacon to lead his men against some hostile Indians. Berkeley exceeded his authority in hanging many former soldiers of Bacon, who died during his campaign, and the governor was called to England. Lord Howard, who was governor in 1684, sought to curb the House of Burgesses in several ways; the king again exacted a tax on tobacco; closed some of the ports; and another rebellion was brewing when James II fled from his throne, and a new era began.

The colony again prospered. William and Mary College, second in the United States, was founded in 1693. Williamsburg became the capital in 1700, in which year the population of Virginia had grown to 70,000, of whom more than a fourth were slaves. The Toleration Act

of 1699 permitted all religious bodies to establish churches. Scotch and Germans came in numbers before the Revolution, while Virginia claimed the southern and western portions of what is now Pennsylvania. George Washington, a young son of the state, was active in the French and Indian War. Virginia continued to grow, despite attempts of royal governors to curb the freedom of the common people, until before the Revolution the opposition and patriotism of the Virginians rose to such a high level that they were on the point of declaring their independence.

Beginnings of Massachusetts. While the Virginia pioneers were becoming established in their homes on the James River, in 1607 and 1608 a small band of zealots fled from England to Leyden, Holland. These were the Pilgrims, a group of separatists, who declined longer to worship according to the forms of the Church of England. Many of them in Nottinghamshire, Lincolnshire, and Yorkshire had been persecuted, even fined and imprisoned. William Brewster, Jr., one of the leaders, had been in government service at Scrooby, England, a center of Pilgrim influence. Now these men and women of simple faith and limited means worked at their trades in Leyden, but they feared the time would come when the secular freedom of the town, a foreign tongue, and other influences might affect their children.

Doubtless they had heard of the Virginia enterprise. They must also have been aware that certain Walloons of Leyden contemplated going to Virginia, but that the company did not welcome them there. Instead, in 1624, these Walloons of Holland founded a colony at New Amsterdam along the Hudson. Captain John Smith who had returned from Virginia, brought back a favorable report, concerning the northern coasts, and did much to counteract the failure of the Maine colony at Sagadahoc. Brewster, John Robinson, pastor of the Pilgrims, and others knew prominent men in England. Chief of these was Sir Edwin Sandys himself, whose brother had been one of the acquaintances of Brewster at Scrooby. Deacon John Carver and Robert Cushman attempted to secure a patent in 1617, but seven "articles" proposed by the Pilgrims for religious and civil government caused long delays. Finally, in 1620, they obtained rights under an old grant that had been given to John Pierce and Thomas Weston for emigration to Virginia. Since this did not apply to New England, in 1621 a new grant was obtained by a joint stock company. Doubtless the terms were similar to those of other patents, except that the Pilgrims had two bodies of adventurers, one in London and one in America. Each immigrant was to have 100 acres, and stock valued at 10 pounds, for which he was to pay in services and profits within seven years. During this time goods and affairs at Plymouth were managed in common.

In Holland they had secured the *Speedwell*, a frail craft of only 60 tons, which proved unseaworthy, after two attempts that delayed the expedition from late July to September. The company from Leyden was met first at Southampton by the *Mayflower*, a square-rigged, double-decked sailing vessel of 180 tons, commanded by Captain Thomas Jones, an experienced seaman. They left the harbor of Plymouth on September 16, 1620, and arrived in Cape Cod Bay, New England, on December 11 (December 21 in the new style calendar.) Besides a crew of about 48 officers and men, the *Mayflower* on her first trip carried 101 persons, of whom 35 were separatists from Leyden and 66 from London and Southampton. There were 56 adults, 20 boys, 11 girls, and nine servants. There were also five adult men, not separatists, including Miles Standish and John Alden, the latter engaged as a cooper. Six of the children (only two of whom reached maturity), were not related in any way to the passengers.

Only three or four of the crew, and but one passenger, died during the voyage of three months, a remarkable record for such enterprises. One child, Oceanus Hopkins, was born at sea, and Peregrine White, as the ship lay at anchor in Cape Cod Bay. Yet during the first winter, which was not severe, no fewer than 44 died, the most of them probably from scurvy because of lack of fresh food. Half the crew also perished. Rude habitations were erected along Leyden Street, while the whole company lived on the *Mayflower*, each house being occupied as it was completed. Samuel Fuller was the Pilgrim physician and Dr. Giles Heale the surgeon until he returned in April on the *Mayflower*. Some of the other ships that brought colonists before 1630 were the *Fortune, Charity, Ann, Little James, Handmaid,* and again the *Mayflower*. John Smith said the population in 1624 was 124; in 1630 it was about 300; and 1637, 549.

Early Government. The Pilgrims sent a party near the present Provincetown to explore the land and find a supply of water. Today a monument commemorates this first landing in New England. Before finally deciding on a spot for their town, some 45 male passengers gathered in the cabin of the *Mayflower* and drew up an interesting "compact." Later this was used as model for most of the new settlements stretching from Cape Cod to the Golden Gate. The text of this compact follows:

"In the name of God, Amen. We whose names are here underwritten, the loyal subjects of our dread sovereign, King James, by the grace of God, of Great Britain, France, and Ireland, etc., having undertaken for the glory of God, and advancement of the Christian faith, and honor of our king and country, a voyage to plant the first colony in the northern parts of Virginia, do, by these presents, solemnly and mutually, in the presence of God and one another, covenant and combine ourselves together into a civic body politic for our better ordering and preservation; and in furtherance of the ends aforesaid and by virtue hereof do enact, constitute and frame just and equal laws, ordinances, acts, constitutions, and offices from time to time, as shall be thought most meet and convenient for the general good of the colony; unto which we all promise due submission and obedience. In witness whereof we have hereunto subscribed our names at Cape Cod, the 11th of November in the year of the reign of our sovereign lord, King James, of England, France,

and Ireland, the eighteenth, and of Scotland the fifty-fourth anno domini 1620."

As arranged in two double rows, the names of the original signers are as follows:

John Carver, Edward Winslow, Isaac Allerton, John Alden, Christopher Martin, William White, John Howland, Edward Tilley, Francis Cooke, Thomas Tinker, Edward Fuller, Francis Eaton, John Crafton, Moses Fletcher, Degory Priest, Gilbert Winslow, Peter Brown, George Soule, Richard Gardiner, Thomas English.

William Bradford, William Brewster, Samuel Fuller, William Mullins, Richard Warren, Stephen Hopkins, John Tilley, Thomas Rogers, John Rigdale, John Turner, James Chilton, John Billington, John Goodman, Thomas Williams, Edmund Margeson, Richard Britterige, Richard Clark, John Atherton, Edward Doty, and Edward Leister.

John Carver was forthwith appointed governor, but he died the following April. After him William Bradford was governor until 1656, except for nine years when others were associated with him. Miles Standish, the captain or military leader, headed a committee that reported in favor of Plymouth as a landing place. Tradition from an aged man in later years informs us that the Pilgrims stepped from their shallop upon a rock of granite in Plymouth Harbor. Later this was removed farther inland, but in 1920 was restored by the Colonial Dames to its original location at the water's edge. William Brewster preached to the congregation, but was unable to administer the sacraments, for he was not an ordained clergyman.

From Bradford's Journal we owe much information as to the religious and social status of the Pilgrims, but outward historical events have to be furnished from other sources.

Numerous problems soon arose. First of all, the company in London sent over Rev. John Lyford, a Church of England man, but the separatists of Plymouth would not tolerate him. He was tried and expelled, and later was at Nantasket, Cape Ann, and Virginia. Then from 1624 to 1628, and again from 1654 to 1669, Plymouth had no established minister. Baptisms were usually dispensed with, and marriages were performed by the civil magistrates. In 1624 each man of the colony was given an acre of land, the town limits were extended, and from time to time in later years grants were made to individuals as need arose.

As in the case of the Virginia plantations, the London sponsors, who had invested their money in the enterprise, complained that financial returns were inadequate. Between the governors on this side and the officers in London and elsewhere, some disagreements arose. It became evident that this double management could not succeed. Miles Standish, therefore, was sent to England in 1625 to arrange a settlement with the original venturers. It was agreed in 1626 that the Plymouth colonists should pay £1800, with a third more for debts contracted, to the London Company. Legally, from this time Plymouth was free from financial management by those across the Atlantic. Yet their agent got them deeper in debt before he was dismissed in 1631. Eight men assumed the total sum, provided they might have a monopoly for six years, of trade with the Indians and with the Dutch who meanwhile had settled in New Amsterdam. In 1648 some £400 remained unpaid, and Winslow and Prence sold their homes, Alden and Standish about 300 acres of land, and Bradford a farm to make up the remaining sum. Altogether the merchant adventurers in London profited at the expense of Plymouth.

Thus the colonists bought their commercial freedom. Whether they were independent in religious and civic affairs still was disputed. A more definite charter in 1630 provided something like grants of land. Bradford ruled strongly, but not too arbitrarily, while new immigrants often caused trouble. As early as 1623 some of the later colonists proved so "bad," says Bradford in his *History*, that Plymouth was "faine to be at charge to send them home again the next year." Some early Massachusetts men proved so frivolous as to be exiled, as Hawthorne whimsically describes in his *Maypole of Merry Mount*. Plymouth assumed rights to punish all sorts of offenses, until question arose as to whether they could exact the death penalty, when John Billington was shown to be "guilty of wilful murder" for shooting a young man who had ventured to poach on his hunting grounds. Billington's lawyer contended that the case must go to England, but Bradford and others decided at last otherwise, and Billington was hanged in an impressive public ceremony.

By 1630 new towns were springing up. Early colonists like the Winslows and the Whites were granted lands as needed at Green Harbor, and Miles Standish an attractive shore tract at Duxbury, where he was for years a magistrate, and where his imposing memorial now stands overlooking the bay. Duxbury and Scituate were peopled in 1636, Sandwich in 1638, Yarmouth, 1639, and Taunton, 1640. The colony began a larger corporate life in 1643 when representatives met from ten towns for council. By 1671 it became a full-fledged commonwealth. Twenty years later Plymouth was combined with Massachusetts Bay and other settlements to form a new commonwealth.

Massachusetts Bay Colony. Schemes for taking possession of land in America flourished after the success of Plymouth became known. The fisheries about Newfoundland attracted three or four settlements, one sponsored by men of Bristol, and another by an eccentric Welshman, Sir William Vaughn, who spent two or three years there, and wrote in America two curious books. His *Golden Fleece* is a zealous defense of fishing. In 1624 Edward Winslow obtained in England a patent, which later proved worthless, to much of Cape Ann. Already a Council for New England, one mover of which was Sir F. Gorges, was inviting towns to encourage settlement in America. Thomas Weston, an old friend of the Pilgrims, in 1622 brought over some 50 to 60 new recruits, who were cared for at Plymouth, and then moved on to what is now Weymouth, the first settlement in the Bay colony. Captain Wollaston and a group tarried briefly in the present town of Braintree, and then went on to Virginia. In

1622 and 1623 Gorges and the Council obtained five new patents, but the schemes of Gorges came to little. Thomas Morton, an adventurer and man of the world, followed Wollaston, changed the name from Mount Wollaston to Merriemount, and set up a May pole, which the shocked Pilgrims uprooted as they scattered the forty companions of Morton.

Robert Gorges and Rev. William Morrell failed, after two years, to continue a colony where Weston had abandoned his settlement. Small groups and individuals, however, gained a foothold. Rev. William Blaxton, a graduate of Emmanual College, Cambridge, England, "a good Episcopalian," was the first inhabitant of Boston, but he withdrew in 1635 because of Puritan intolerance. Thomas Walford and his wife settled where Charlestown now is located. Samuel Maverick was the earliest inhabitant of what is now Chelsea. John Balch in 1624 went to Cape Ann and then to Salem. John Bursley and a few others remained at Weymouth, and so founded the claim of second permanent settlement in New England for that town. By 1625 probably 50 or more settlers were scattered about eastern Massachusetts, outside the posts of the two main colonies.

Meanwhile the men of Dorchester, England, led by their rector, Rev. John White, finally obtained rights in the Bay colony. Ships came in 1623, 1624, and 1625, leaving 14 men to winter on Cape Ann in the first, and 32 more, in the second year. Plymouth claimed this area, but Roger Conant, brother of one of the English sponsors, became governor, and took the remnant of the settlement to Salem, where they helped found that ancient town at Naumkeag, now Beverly.

White and others, with remarkable courage and faith, organized the New England Company, an unincorporated group of 90 members, not all Puritans, but impelled by religious motives. On June 20, 1628, the ship *Abigail* left Weymouth, England, with about 40 and generous supplies aboard. The colonists reached Naumkeag on September 6, and the Conant party of about 30 joined them. John Endicott, though having no authority as governor, was elected leader. He ruled with a stern, but not necessarily cruel, hand for several years, his sole zeal being the interests of the colonists and their settlements. One of his first acts was to disperse the remnants of the revellers at Merrymount, but Standish of Plymouth had already driven Morton to England. By newer grants, in 1629 and 1632, the Massachusetts Company absorbed the other interests, obtained more definite grants of land, some of this at the expense of Plymouth, which always had a vague status.

Influential persons began to come, several of them men of wealth and higher education. In 1629 five ships brought recruits and new supplies, one of them being the *Mayflower*. Religious leadership vested in Skelton, the minister at Salem, and the teacher Higginson, both of whom had been censured in England for nonconformist views. Dr. Samuel Fuller, beloved doctor of Plymouth, came to them and explained the separatist principles. Massachusetts Bay at last decided not to separate from the mother church, but to become as independent of the king's government as circumstances would allow. Plymouth, on the other hand, cut off entirely from the Church of England, but remained entirely loyal to the king. While the Puritans wished to change the form of worship, and to make it less formal, they sought to maintain what they considered the essential spirit of the older church. As time went on, differences between separatists (or the Pilgrims) and the Puritans became fewer and fewer. Out of these principles grew the Congregational establishment of New England. Just as Plymouth at first would not tolerate an Episcopalian service there, Massachusetts Bay, in turn, persecuted the Quakers, Baptists, and all forms of worship not sanctioned by Puritans.

Besides Weymouth, Dorchester, Salem, and Boston, villages soon sprang up in the Boston area, such as Charlestown, Roxbury, Cambridge, Watertown, Muddy River (now Brookline), and Lynn. Concord was settled partly by persons from Plymouth. Among the many notable men who commenced to emigrate to Massachusetts Bay colony were John Winthrop, who came in 1630, and Roger Williams, founder of Rhode Island, who came the next year. In a terrible epidemic in 1630 nearly a fourth of Endicott's followers had perished. The large party that came with Winthrop found affairs in grave necessity. Yet the further Puritan persecutions in the mother land in 1633 and later brought many shiploads of new recruits. By 1634 the population about Boston was nearly 4000, and in 1642 probably not fewer than 17,000 or 18,000.

Early Government of Massachusetts. Men like Conant, Endicott, and others ruled briefly by virtue of their connection with the Company of New England or the Massachusetts Bay Company, the two which sent out the early colonists. Between 1629 and 1633 over 15 other patents to parts of Northern New England were issued, but still the question of legal status was not settled. The king's ministers held off because of the Puritans. Gorges of the Council of New England was active, in and out of season, in his efforts to foster new settlements. With dissensions, and cross purposes, among the governors of the company in England, Morton (he who had been twice driven from Merrymount) proved a skilful lawyer, and did the Puritans much damage at court. At last in 1635 sixteen members of the Council decided to resign their charter, and two years later the documents of the Massachusetts Bay Company were ordered to be returned to England.

Meanwhile, the charter had been in America, and whether it was ever surrendered is doubtful. Winthrop had come in 1630 with the stipulation that management of the Bay Company be transferred to this side of the Atlantic. He was the first officially appointed governor, and was chosen 12 times in annual meetings until he died in 1649. His wisdom, faith, and fortune went to assist the colony, and his conservatism and good will saved the government several times from shipwreck. In 1634 and again in 1645 he led the colonists in preparing,—at first even in fortifying the shores,—against coercion that England threatened. The king again demanded

the charter to be returned in 1638. The Civil War in England, and the passing away of some of the original sponsors of the settlements, served to give the New England towns greater freedom and authority. Late in 1641 a Body of Liberties, so called, defined the rights of citizens, and provided a legal code, with the common law of England as supreme. At first nobody could become a freeman, or citizen having full rights, unless he belonged to a church. Witchcraft, idolatry, blasphemy, and treason were among the ten offenses punishable by death, a number quite moderate compared with those so included in England.

More definitely the government consisted of a governor, his deputy, assistants, and freemen of "the company," while only 12 members were eligible to the general court. The assistants acted much as the English justices of the peace. Winthrop and his associates reluctantly granted rights of freemen to 109 men who first applied to the first general court in 1630. Democracy at first was not part of the program, but distances between towns, independent spirit of the settlers, and other causes soon made each settlement virtually independent in economic, political, and religious affairs. Thus grew up the New England town or, as we think now, township government, made up of a group of houses, with outlying lands for pasturage and further expansion of settlement, farming, and other purposes. Along with the local government in Virginia, the New England town, with its town meeting, became the backbone of democracy in the new world, and eventually the force which broke the power of foreign domination.

After the first few years of indiscriminate settlements, provision was made for assigning 36 square miles for each new township. This tract was sold to a group of original proprietors, who occupied the land directly, or more often sold it or let it in small parcels to real settlers. New arrivals were freemen, but usually not proprietors of the land, save by barter of some sort. The meeting house and school, for which certain plots were set off, became the center of the life of the town.

Trouble arose very soon between the governor and his assistants and the various towns. For instance, a tax was levied for fortifying Newtown, the modern Cambridge. Complaints arose, and the general court decided that two representatives from each town should advise the central government. After two freemen from each town demanded larger rights in 1634, a representative system was organized. Though each town was thus represented, voting at home was confined to a limited number of freemen and church members. In 1635 the district of New England was redistributed by the crown, and New Hampshire, Maine, and other independent units grew out of this authority.

Massachusetts, along with other parts of New England, continued to develop gradually up to the time of the Revolution. Frontiers were pushed west to the center of the state about 1700, and to the western borders and a bit beyond by 1800. Religious dissensions, restrictions by the Puritan oligarchy, and formation of new sects caused much trouble. Ann Hutchinson and Roger Williams were driven to found settlements that later became Rhode Island. In 1644 laws against Baptists were passed. In 1656 to 1662 Quakers were repressed, and four of them put to death. King Philip's War, and other border raids by Indians, kept frontier settlements in constant terror. During the French and Indian War, Massachusetts contributed generously in men and supplies, sharing in such expeditions as those against Oswego, Acadia, Crown Point, and Louisburg.

Relations with England at times were sorely strained. Joseph Dudley, a native son, became provisional governor in 1686, but very soon Sir Edmund Andros came over from England to rule New York and all New England. When the Revolution of 1688 gave Britain a new government, a mild revolt in Boston, and especially in Connecticut, drove Andros out. (See article on the *Charter Oak*.) The Writs of Assistance, a form of search warrant, instituted by England in 1756 gave rise to much opposition, which rose to a climax in the impassioned speech of James Otis before a court in Massachusetts in 1765. Other humiliating measures, such as the Stamp Act in 1765, quartering of troops in Boston, in 1770, the obnoxious tax on tea, and acts designed to close Boston to foreign commerce, all were tinder for the fire which broke out at Lexington and Concord. Virginia, and other colonies, were also ready, and so the Revolution began.

New Hampshire. Interest in fisheries in the north became the impetus for colonizing schemes, the first of which at Sagadahoc has already been described. The original Plymouth Colony claimed the coasts of what is now Maine and even beyond. Sir Ferdinando Gorges, always a prime mover in schemes to people New England, had a vague title to this region as early as 1623. Trading posts sprang up at Kittery, Richmond Island, near Casco Bay, and fishing stations at several other coast points. Gorges hoped to make the capital the post of Bristol, a farming locality, where he had a house erected in 1630. Having abandoned hopes of getting concessions for the New England Council, after 1635 he turned to ask a direct grant from the king, which he secured in 1639. From then to his death in 1647, he allowed commissioners to keep order in Maine.

In his new grant Captain John Mason was an associate of Gorges. He obtained the western part of the grant, now New Hampshire, where posts had been established at Portsmouth, Dover, Exeter, and others. Struggles broke out between Puritans and more liberal settlers, and in 1641 a boundary dispute arose, which was not settled for many years. Massachusetts claimed all the southern part of the land, and the Mason heirs, after numerous petitions for relief, at last in 1679 set up New Hampshire as a separate government. Because of failure to attract settlers and maintain a government, Maine became part of Massachusetts in 1653. From 1686 to 1689 New Hampshire was part of the Dominion of New England under Andros. In 1692, after a temporary union with Massachusetts, the Mason heirs organized a provincial administration. From 1699 to 1741 the two

colonies had the same royal governor, but otherwise were separate.

New York Colony. Verrazano discovered the bay and harbor of New York in 1524, Gomez probably saw this region the next year, and later French vessels ascended the Hudson to trade with Indians. Hudson sailed up the river in 1609, and Champlain was in northern New York that summer, but no attempt was made to colonize. The Dutch claimed rights along the Hudson through the Dutch East India Company. After a profitable voyage to deal with the Indians in 1610, the Dutch became active in planning a settlement. In 1614 Captain Adrian Block rounded Long Island, discovered the island bearing his name, and that same year the New Netherlands Company was formed. In 1615 a trading post was established within the limits of the modern Albany, and a few huts were set up on Manhattan Island. In 1624, after the West India Company had been formed, the first permanent colonists, 30 families, mostly Walloons from Leyden, Holland, came with their governor, Cornelis Jacobson May. When Peter Minuit, director general or governor, bought the island of Manhattan from the Indians for the equivalent of $24 in 1626, 300 or 400 settlers were already in New Netherlands, including a flourishing post at Albany.

The Patroon System. Minuit ruled until 1632. Meanwhile, a feudal system of land holding, amounting to ownership, was authorized. Any settler could have 6 miles on one side of a river or stream, or 8 on either side, extending back an indefinite distance, provided that he establish 50 settlers on the land within four years. Old families today like the Van Rensselaers (who held a large tract near Albany), the Schuylers, and the Roosevelts date from days of the *patroons* as the Dutch landlords were called. (See article on *Anti-Rent War.*)

After four years of a ruinous tenure by Governor Wouter van Twiler (1633–1637), under William Kieft, the new director-general, the company gave freedom of trade to all, and so ceased the original monopoly. Trouble with Indians in 1641 laid most of the smaller settlements waste. Restrictions against manufactures in New England and Virginia brought new settlers. Peter Stuyvesant, a popular governor, found difficulties, as Kieft had before him, to keep the English from encroaching from the east, and the Swedes from their settlements along the Delaware. In nine years (1655–1664) the population increased from 2000 to 10,000.

English Occupation of New Netherlands. By various claims, the English always disputed the Dutch right to lands in the Hudson valley. In 1653 the Dutch built a wall (hence the name Wall Street) across the island at the northern limit of settlement. Minuit in 1626 had erected a fortification called the Battery on the southern tip of the island. Charles II, 1664, placed all the land between the Connecticut and the Delaware Rivers, including all of Long Island, previously divided between New Amsterdam and Connecticut, into one grant, and gave this to his brother James as patron. Colonel Richard Nicolls was sent as conqueror and governor. The inhabitants then numbered 1500. Though the Dutch were displaced before their colony obtained much prominence, they left their imprint on names, customs, and in some respects the laws of New York. From August 1673 to February 1674, the Dutch again ruled in New York, after their fleet of 23 ships had taken possession during the war with England. Then they surrendered all claim, by the peace of Westminster, to their New Netherlands forever.

Political Progress in New York. Under the West India Company, a director-general ruled at New Amsterdam, assisted by a council having all powers subject to review by the directors of the company in Amsterdam. Minuit set up forts and built a warship of 1800 tons and 30 guns. Fur trade was reserved to the company, but the patroons could trade along the Atlantic coast. Colonists on the patroon estates were exempt from taxes for the first 10 years. Under Wouter van Twiller the Dutch Reformed Church became the established form of worship.

Democratic government began in 1641 when Kieft called in some men to advise as to whether to make war on the Indians, who had killed some fur traders. After delay, in 1642, the new committee informed Kieft they were agreeable if he would command the expedition. Stuyvesant chose a council of nine, but they angered him by their demands, and the citizens appealed to Holland for a municipal government on Manhattan Island. An appointive council was provided for. In 1664, however, two delegates from each settlement, 24 in all, made up the first provincial assembly. In 1675 Governor Edmund Andros established at Albany a council to treat with the Indians, a body which did much to protect the colony. Troubles with Andros led to appointment of a new governor, Colonel Thomas Dongan, who called an assembly in 1683. At this time a charter of liberties was drawn up, some provisions being religious freedom, trial by jury, a vote for every freeholder, and abolition of martial law.

In 1688 the king consolidated New York, New Jersey, and all New England into an administrative district with Andros in charge. The coming of William and Mary to the throne, however, encouraged the colonists in America to imprison Andros in 1689.

Affairs in New York took a curious turn, however, when a German merchant named Jacob Leister set himself up as virtual governor, obtained a large following, and in 1690 called delegates together from Massachusetts, Plymouth, Connecticut, and Maryland to meet in New York to consider a common defense against the Indians. This was the first attempt at union of the colonies of America for a mutual benefit. When Colonel Henry Sloughter, the new governor, arrived from England, Leister refused to give up the fort. He was finally captured, after some bloodshed, was tried, and executed. For many years afterward, inhabitants often took sides politically as to their opinions of these proceedings. Sloughter, 1691, restored the assembly which the king had abolished in 1686. From then on the political history of New York is that of the increase in rights of the people.

Before the Revolution districts along the Hudson filled with settlers, who also pushed out along the Mohawk. Save for Long Island, and

a few scattered habitations west of Albany along the postroad, all else was a great untouched wilderness. The Indians along the frontier were kept friendly by presents, the kindly offices of men like Philip Schuyler, and by hatred of the Iroquois for the French in Canada.

The Freedom of the Press. William Bradford in 1725 had founded the first newspaper, a semi-official organ called the *New York Weekly Gazette*. Eight years later, John Peter Zenger (1697–1746) established a rival paper, which often criticised the acts of the government. In November 1734, Zenger was arrested for libel. After his first lawyers were disqualified, Alexander Hamilton agreed to defend Zenger without a fee. A quick acquittal by the jury did much to establish the freedom of the press in America.

New Jersey. Some of the first group of Walloons that came to New Amsterdam in 1623 pushed southward and founded a colony on the eastern bank of the Delaware, where they built Fort Nassau near the present Gloucester. Across on the west bank about 50 Swedish families located, the first persons in what is now Delaware. Another early Dutch trading post was at the present Hoboken.

The English king, however, thought this territory to be his by discovery and grant. In 1664, Charles II gave all the district between the Hudson and the Delaware to his brother James. The English took possession of the Dutch settlement on the Delaware. Then the territory went to Lord John Berkeley and Sir George Carteret, with a cousin of the latter the first governor in East New Jersey. In 1674 Charles II confirmed this grant to Carteret, shortly after Berkeley had sold for $5000 his rights to the western half. It was bought by two Quakers, who finally disposed of their rights to William Penn and his friends.

Influx of Quakers into the region began at once. By 1681 nearly 1400 had come to the colony, the chief point being Burlington. From the outset the government was liberal, with a board of commissioners elected by the proprietors and the people together. Jury trials and right of petition were granted, and capital punishment was forbidden. In 1682 the rights of Carteret also passed to the Penn associates.

Following troubles between the owners and their grantees, in 1702 both parts of New Jersey were constituted a royal province. By this time there were 10,000 settlers along the rivers and the coastlines.

Disputes developed later between the proprietors of the land and their tenants, and between the people as a whole and the government of England. The Puritans of West Jersey at times could not agree with the Quakers of the Eastern part. Finally, Lewis Morris in 1738 obtained once more an independent local government for all of the colony. The last of the governors before the Revolution was William, son of Benjamin Franklin, who proved such a bitter Tory that the Congress removed him in 1776. He died in England in 1813.

Colonial Delaware. Hudson for the Dutch first explored the Delaware Bay in 1609, Lord De la Warr perhaps also in the next season, and Cornelius Hendrickson in 1615. In 1631 the Dutch West India Company left a few persons where the present Lewes is located, but the Indians soon dispersed the colony. Seven years later Peter Minuit of New Netherlands bought some of the land of the Indians and placed a few people where Wilmington is now. Swedish immigrants arrived in 1643 near Chester, and at two or three other points, including the mouth of the Schuylkill River. In 1651 Governor Stuyvesant of New Netherlands erected a fort where New Castle is today, but three years later a new party of Swedes drove the garrison out. In retaliation Stuyvesant sent a fleet in 1655 and captured the fort and also the one at Wilmington. New Sweden then passed under control of the Dutch from Manhattan Island, but part of Delaware was sold to the city of Amsterdam in 1656. In 1663 the rest of Delaware county went to Amsterdam, all Delaware then to the English when Charles II gave the land to his brother, the duke of York, later James II. Soon the northern boundary was determined by drawing an arc with New Castle as a center, accounting for the curve today between Delaware and Pennsylvania.

In August 1680, three years before final title had come to him, the duke of York leased all of Delaware to William Penn for 10,000 years. So much dissension arose, however, that in 1691 Penn chose a deputy governor for the "lower counties," as Delaware was called. In 1704 they obtained their own legislature, in 1710 a separate council, but the governor of Pennsylvania remained the chief executive until 1776. In 1767 a boundary dispute with Maryland, of many years standing, was finally settled. In the Revolution, Delaware furnished two regiments for the Continental Army. When a state constitution was adopted, one unique feature was a privy council in addition to the regular officers and departments, which arrangement gave the new governor little power of his own. Delaware sent five delegates to the Annapolis Convention in 1786, and was the first state (December 7, 1787) to ratify the Federal Constitution.

Maryland. George Calvert, the first Lord Baltimore (c. 1580–1632) tried to settle Newfoundland in 1620, where three years later the king gave him a charter for a colony, called Avalon. A personal visit in 1627 convinced him that the climate was unsuited. About this time he became a Roman Catholic. In 1629 he proceeded to Virginia, where he was very coldly received as he tried to set up a habitation south of the James River. In 1632, however, he obtained a patent to all land and rights to the territory between the Potomac and the 40th parallel, but he died before the Great Seal was placed on his charter, which was issued to his eldest son, Cecil. Late in the following March, about 300 laborers and domestics, with 20 gentlemen, arrived in two small ships to found an establishment on the promontory between the Potomac and the Chesapeake Bay. Leonard Calvert, brother of the original grantee, came as governor.

Maryland like Delaware suffered much from disputes over territory and boundaries. William Claiborne, secretary of the governor of Virginia, in 1631 had placed some colonists on Kent Island, which he had bought from the In-

dians. Kent Island appeared clearly within the territory given by the duke of York to the Calverts, but it was also within what was the original Virginia grant. Leonard Calvert and Claiborne, the latter supported by Virginia, carried on a feud for several years, during which much blood was spilled. Pennsylvania also encroached on the north and west borders of Maryland. The duke of York also transferred to William Penn the land known as Delaware, which was in the province of Maryland as originally granted by him to the Calverts. The question was what Penn's charter meant in granting him all to the "beginning of the forty-second degree of Northern Latitude." Likewise Calvert's patent gave him all to the same parallel on the north. It was not until 1767 that the question was finally settled by asking two English surveyors, Mason and Dixon, to establish a correct line, which they fixed at 39° 43' 26.3". In 1692 the crown set up a government in Maryland, but a Protestant became heir to the colony in 1715, when the lands were restored to Calvert descendants, and Roman Catholics were disfranchised.

Freedom in Maryland. Though the early Calverts were Catholics, they insisted that absolute religious toleration should be granted to all in Maryland. Protestant colonists were encouraged. In 1649, however, when the Puritan element became rather strong, Calvert changed the original stipulation so that only trinitarians should be protected. The original charter also granted Calvert the sole right of initiating legislation, but in 1638 he gave up this privilege, a very early example of granting local self-government in America. After 1650 the legislative body was divided into two houses, one of which was composed of freemen, whose consent was necessary before a bill might become a law. Charles Calvert, governor in 1670, tried to restrict the ballot to all who had a freehold of 50 acres or property worth at least £40. By this time the tradition of freedom was so established that bitter opposition arose, which continued in 1715 when another Calvert tried to establish the principle that only those English statutes applied to Maryland as specifically related to British colonies. At the time of the French and Indian War in America, the legislative houses of Maryland were deadlocked, and in the end rendered the English little help.

Once more at the time of the Revolution, those in Maryland opposed all government, even the Continental Congress. Delegates were instructed not to vote for independence, and Maryland held out almost to the last minute. Property and other qualifications were established in the new state constitution of 1776. In 1810 these were again removed. Negroes were given the ballot in 1802. Maryland also refused to sign the Articles of Confederation until all states that claimed western territory should give up their rights.

With the exceptions noted, Maryland remained a proprietary colony until the time of the Revolution. In the Calvert family, between 1725 and 1771, there were seven Lord Baltimores. Frederick Calvert, the last of them, left no heir to inherit his lands and titles.

Pennsylvania. Settlements were made in what is now Pennsylvania nearly 40 years before William Penn laid out his grant there. In 1643 the Swedes appeared near the present Chester, then called New Gothenburg, but 13 years later the Dutch took control after they had captured the forts in Delaware and Maryland. In 1664 the English gained possession. By this time Quakers persecuted in England found their way into all the colonies of America. George Fox, founder of the sect, in 1671, made a tour of inspection of the Quaker settlements from the Barbadoes to Rhode Island.

Yet what the Quakers desired was a colony of their own, where they could be free to settle and govern. William Penn, son of an English admiral, proposed that the English king grant him land in the new world to compensate for a debt of £16,000 owed his late father. His charter was granted on March 4, 1681, but the language gave rise to disputes with New York, on the North and Delaware and Maryland on the south. Penn claimed all to the 43° parallel, but New York insisted that the boundary was the 42°, a dispute settled a century later. The one with Maryland was settled likewise in 1767. Eventually, the duke of York gave Penn a quit-claim deed including the territory of Delaware, so that Pennsylvania could have an outlet to the sea. Trouble arose at later times with Connecticut over settlements in the northwestern counties, which were claimed by Connecticut and peopled by emigrants from there. A committee appointed by the Continental Congress to arbitrate the dispute awarded this land to Pennsylvania in 1782. (See *Wyoming Massacre.*) Ten years later the national government sold the state a three-cornered strip so that an outlet could be obtained to the Great Lakes, and Erie grew up as the chief port. Likewise, Virginia in 1784 allowed the southern border of Pennsylvania to run along the Mason and Dixon line, and so abandoned all claim to a considerable tract extending even as far as the present Pittsburgh.

Religious Refuge. When Penn obtained his charter, about 1000 persons already resided in the eastern area, mostly Swedes, Dutch, Finns, and some Quakers. Absolute religious freedom attracted many sects from Europe to escape persecutions in states where one established church only was tolerated. Welsh Quakers settled in what are now Montgomery and Delaware Counties. Pastorious led his German Mennonites in 1682 to Germantown, where a flourishing community sprang up, a seat of several early American industries. People of Lutheran and Reformed churches settled in the fertile districts stretching from Easton down to the Cumberland valley. Moravians came to Nazareth and Bethlehem. Finally, the Scotch-Irish Presbyterians came into the Wyoming valley, and later the Methodists into several counties before and after the Revolution.

Penn died in 1718, and his second wife in 1733, after which the proprietorship descended to John, Thomas, and Richard Penn, their children. William Penn, son by a first marriage, was governor of the state at the outset of the Revolution.

Save for some bickerings between the proprie-

tors and the people, peace ruled in Pennsylvania for many years. In 1683 Penn made his "Great Treaty" with the Indians, and the colony was free from the usual strife with the redmen. Voltaire called this "the only treaty never sworn to and never broken." As the land filled up with settlers after 1700, the French were building their ring of forts along the lakes and down the rivers, in an attempt to prevent England from gaining a foothold west of the Allegheny Mountains. Virginia sent George Washington to make a counter move by building a fort where Pittsburgh now stands. Washington defeated the combined force of French and Indians at Mountain Meadows, but had to surrender Fort Necessity. These events led to the ill-fated expedition of General Edward Braddock, described elsewhere. In 1763 the Indians captured forts at Presque Isle and Venango, and white settlers of the band known as "Paxton's Boys" killed some Conestoga Indians. Apart from this warfare, threats from some backwoodsmen, led by the Paxtons, who marched on Philadelphia, and a border struggle between settlers in the Wyoming valley, Pennsylvania knew peace for many years. During the life of Penn, and for years afterward, no strife arose.

Indeed at the time of the Revolution, the Quakers and others in Pennsylvania were reluctant to join the other colonies. With the waning of Quaker influence, however, and the election of Whigs like John Dickinson, Thomas Mifflin, and Joseph Reed, it was decided to cast the lot of the colony with Virginia, Massachusetts, and the rest. In 1776 the Penn heirs were paid some £120,000 for their rights. Penn himself had spent much time in England, where he died. Today some of his descendants reside in Luzerne County and in Philadelphia, the city he planned and named.

Connecticut. Settlement of Connecticut and Rhode Island grew out of religious controversies. Massachusetts Bay colony was intolerant toward sects like the Quakers, Baptists, or even members of the Church of England. The rigid Puritan doctrine culminated in the strange delusion at Salem in 1681. Old women, unfortunates, and even prominent persons at last in Salem were accused by hysterical or lying girls of bewitching them. Before the fanaticism abated, some 32 had been killed, one by being pressed to death in a way resembling the horrible tortures of the Middle Ages.

Migrations to Connecticut. The Earl of Warwick held the original patent from the Council of New England to Connecticut. He sold it in 1631 to Lords Saye and Brooke, and four years later they sent some settlers under John Winthrop, Jr., who erected a fort at the mouth of the Connecticut River, not far from the present Saybrook. In 1633, however, the Dutch had erected a fortification at Hartford. Not long afterward men from Plymouth set up a trading post about ten miles up the Connecticut. Within two years, however, more than 800 persons migrated from Dorchester, Cambridge, Watertown, and Roxbury, to the river valley. In June, 1636, Rev. Thomas Hooker and Elder John White let an extensive caravan from Cambridge, where they had felt repressed in their religious experiences. Meanwhile, the Pequot Indians had killed a Virginia sea-captain, and Governor Winthrop of Massachusetts demanded tribute, but his agent sent for this was murdered at Block Island. In 1637 the Pequots raided Wethersfield, but the settlers gathered and very soon all but exterminated the tribe.

Now that Connecticut was free from the danger of Indians, the Rev. John Davenport and Theophilus Eaton began the New Haven colony as a theocracy. Only church members could vote, and the laws were based on those of Moses. Very soon New Haven, Guilford, Milford, and Stamford were so governed. In 1640 settlers from New Haven obtained title to Long Island and began a colony at Southold. Men from Massachusetts tried to settle opposite Manhattan, but the Dutch drove them to Southampton far out on the island.

Saybrook, which did not gain rapidly, was united to Connecticut in 1644, when the proprietor, George Fenwick, sold his rights to the settlements along the river. In 1662 a royal charter united the colonies at Hartford and New Haven.

Early Government. The three colonies now making up Connecticut show considerable diversity in government. Saybrook was Puritan, but not very different in organization from earlier New England settlements. In 1638 the settlements along the river, Connecticut colony proper, framed the Fundamental Orders, based on the laws of Massachusetts. No particular mention was made, however, of any control by the English crown. This omission is said by some to constitute the first effort in the American colonies to break away from any domination from across the Atlantic. Like Plymouth, but quite unlike the Bay colony, Connecticut made religion no test for citizenship. Yet union of church and state was assumed. In 1659 the general court, organized under the Fundamental Orders, declared that one must own property worth thirty pounds in order to qualify for suffrage. New Haven colony, on the other hand, was a theocracy, requiring a definite religious test, and basing laws on the scriptures. Some of the 45 "Blue Laws" of New Haven, however, were taken from Massachusetts and other early enactments. Conspiracy against the ruling powers was a capital offense; so was adultery. Sabbath observance was strictly enjoined, and persons harboring Quakers were subject to heavy fines. Trial by jury was forbidden. Such is the contrast between Connecticut colony and New Haven colony before 1650.

When the three colonies,—Saybrook, New Haven, and Connecticut,—were united in 1665, a new and more liberal charter was granted. Hartford was fixed as the capital, but shared the honor with New Haven from 1701 to 1873. Laws passed by the general court were not subject to any veto by the English crown or any deputy. Connecticut thus until the Revolution looked only to the charters for authority. After 1657 baptised persons could vote, and after 1708 religious bodies were free to build their churches, though later friction developed between the government and some of the sects.

Connecticut supported Massachusetts in the strife over the Stamp Act, prepared for war in 1774, appropriated money to send a force com-

manded by Ethan Allen to the northern border, furnished about half the men Washington had in 1776, and made the old charter of 1662 into a state document in 1776. Representation to the national Congress was proposed by Connecticut as a compromise measure. The colony suffered from boundary disputes with Massachusetts, Rhode Island, and New Amsterdam. To compensate for various losses of territory, a section known as Western Reserve was given in what is now Ohio. The boundary between New York and Connecticut at one point was not settled finally until 1881. See article on *Charter Oak*.

Roger Williams and Rhode Island. In 1631 a brilliant recent graduate of Cambridge University, England, came to Massachusetts Bay colony. He had ideas of his own, found it inconvenient to remain in Boston, and settled in Salem, where he taught and sometimes preached. The general court, however, refused him ordination. Williams said that church and state should not be united, that the Indians should be compensated for their land, and that one should not adhere to the established church or take any oaths he did not sanction. Salem was punished for harboring him, and even Plymouth found him a liability. In October 1635 he was tried before magistrates and banished. Intending to go to the region of Narragansett Bay in the spring, he remained behind, and finally was driven to Plymouth, from where he went to the Indians at Narragansett. In June of 1636 he founded Providence, which soon became the refuge of many persons seeking a religious haven.

Mrs. Anne Hutchinson in 1638 was also banished from Boston, where she stirred up a terrible controversy in the church of Rev. John Cotton, who favored her, as did Governor Harry Vane. She was opposed by the John Winthrop party which declared that she was posing as a prophet. When Vane lost the election in 1627, her chief support fell away. Mrs. Hutchinson went to Providence, thence to the island of Aquidneck, afterward named Rhode Island, where she, her husband, and about 16 others formed a government, with William Coddington as chief magistrate. With a rapidly increasing group, they established the towns of Portsmouth and Newport. Samuel Gordon, leaving Providence, founded Warwick in 1643.

Portsmouth and Newport united in 1640, and the other two settlements joined them in 1647, but again there was a division from 1651 to 1654. Roger Williams was active in bringing harmony, and went to England and there secured a charter for all Rhode Island in 1663. The name adopted legally was Rhode Island and Providence Plantations, which as used even today is the longest name for the smallest state. During the oppressive administration of all New England, together with New York and New Jersey, by Edmund Andros, the charter was suspended for three years, but again was restored after the English Revolution of 1688.

Newport became the center of the carrying trade with the West Indies and also of privateering. Rhode Island felt heavily the oppressive force of the Sugar Act of 1764 and the Navigation Acts, which greatly crippled the shipping and progress of the colony. When the British ship *Gaspee*, sent from England to enforce these acts, ran aground in Narragansett Bay in 1772, the men of Providence burned it to the water's edge. Nathaniel Greene, commander of the Rhode Island militia, became a Continental major general in 1776, and directed much of the southern campaign. Under Howe the British maintained a garrison of over 6000 at Newport, which the colonials under General John Sullivan and a French fleet under Count D'Estaing tried in vain to dislodge. While the new American government was being organized, Rhode Island maintained an independent attitude or an individualistic one, such as still is apparent in many of the smaller communities. Roger Williams was a Baptist for a time, and then a "seeker" or independent. Both in religious and political affairs he directed a spirit of tolerance and freedom.

Colonial Unions. After the first stage of pioneering, there was a tendency in all colonies for the isolated communities to unite on some common ground. On a large scale a form of union was attempted in 1643. It was known as the United Colonies of New England, made up of the leader, Massachusetts Bay Colony, Connecticut, Plymouth, and New Haven. In spite of divergence of opinion and difference in political and other ideals, it continued to 1684, a period of 41 years. During this time the Commonwealth in England had come and had in turn given way to the Restoration. Plymouth and Connecticut led in progressive political enactments; Rhode Island and Plymouth, in religious tolerance. Massachusetts and Connecticut led in political influence. Already in 1636 Plymouth had enacted the Great Fundamentals, in eight general articles, putting into words the political faith of men like Brewster, Bradford, and their successors. After the Commonwealth the colonies feared royal encroachments. Hence, they were quite prepared to resist the obnoxious actions of Sir Edmund Andros as governor of the New England, New York, and New Jersey settlements. Connecticut had united three separate colonies in 1665, following the Rhode Island union thirteen years before. New Jersey followed in 1702. Doubtless, these experiences paved the way for events of the Revolution.

The Early Carolinas. During the first periods of exploration and early settlements, it is impossible to separate the fortunes of the north and the south parts of the two Carolinas. Spanish explorers like Gordillo and Quexos, coming from Española, coasted north to Cape Fear in 1521. Ayllón secured a patent in 1523, and Stephen Gómez, seeking a north strait, skirted the coast from Nova Scotia to Florida in the same year. Gómez completed for Spain the exploration of the coasts from Magellan to Nova Scotia.

Ayllón made a settlement which lasted a few months. In 1566 the Spanish settled on Parris Island and remained 20 years, after some French under Ribaut had been there. From this time the Spanish confined their plans to Florida and the coast of the Gulf of Mexico.

Sir Robert Heath, attorney general under Charles I, obtained a grant of land between

the 31st and 36th parallels in 1629. No settlement was attempted. Charles II made a similar grant to the earl of Clarendon and other favorites in 1663, including all between the 30th and 36th parallels and extending west to the Pacific. Ten years earlier some Presbyterians had emigrated from Virginia to the Chowan River. Two or three other early attempts at settlements failed, and Virginia was given control over the entire territory. Since the time of the ill-fated effort to settle on Roanoke Island, now in North Carolina, Virginia had a nominal claim to the coast almost to the present Florida. (See under *Virginia* for history of Roanoke.)

Proprietary rule in the Carolinas lasted from 1663 to 1729. It was characterized by much bickering between the patentees and the actual settlers. One year before the first permanent settlement in 1670, Lord Ashley, better known to us as the earl of Shaftesbury, assisted by the English philosopher, John Locke, drew up the "Fundamental Constitutions," based on feudal principles long outgrown. For 30 years the colonists disputed over one provision or another of this first constitution for the Carolinas. By 1693 the commons in South Carolina won the right to initiate legislation. Then followed a church struggle, which was ended only when the Whig House of Lords in England in 1704 refused to make membership in the Church of England a test for legislators in South Carolina. Yet in 1706 the Church of England was established and so remained until 1778. After the proprietors had vetoed several important laws, the people rebelled in 1719, expelled the governor, and elected their leader in his place. Though a royal province was set up in 1720, the final payments to the proprietors were not made until 1729.

All these years the two districts were regarded as one province. Yet each had its own governor until 1691. Then for 21 years one governor resided at Charleston, and another deputy in the north. Separate governors were appointed after 1712. No attempts to fix precise boundaries were made until 1730, and they were not all determined until 1815.

Meanwhile, North Carolina had its own period of turmoil and struggle. Following the Presbyterians at Chowan River, Huguenots, Swiss, Germans, and others came in considerable numbers, many of them down from the valleys of Pennsylvania. The north part of the Carolinas for a long time was called Albemarle, which contained about 2500 inhabitants in 1682. By the close of the colonial period, North Carolina had 300,000, including 40,000 blacks. Of the 16 governors or their deputies, between 1673 and 1712, six were driven out of office by the settlers. During the trouble in 1677 over collection of customs, John Culpepper and 100 men imprisoned the governor, the collector of customs, and most of the members of the assembly. Not until the coming of Governor Ludwell in 1691 did the district quiet down. Another cause of bitterness was the decree that Presbyterian ministers could not perform marriage ceremonies, and the Scotch-Irish became much embittered. When John Archdale, a Quaker, came as the governor in 1685, conditions began to mend.

North Carolina as a Royal Colony. Seven of the proprietors gave up their rights in 1729 for £17,500, with £5,000 arrears in rent, which had been in dispute. Lord Carteret, the final owner, gave up his claim in 1744 in return for land on the borders of North Carolina and Virginia. Many disputes arose between the crown and the colony, such as those over duties on imports, religious establishment, fees, and products. After 1740 the "back country," or the districts across the mountains to the west were pretty well occupied by Scotch-Irish, German, and other immigrants. Between them and the coastal district was an area of hills and beyond sparsely settled forests. Hard times, large fees, extortions by officers led the men to organize themselves into a band of Regulators. When Governor Tryon led a force against them, they broke up, but later came back and were defeated in the battle of Alamance in 1771. Fifteen were captured, and seven of them executed. Trouble continued, however, until 1835.

The first provincial congress met at Newbern in 1774, and a second in 1775, after which Governor Martin fled for safety. On May 21, 1775 a committee in Mecklenburg County passed some resolutions, which some have thought were more drastic and more far-reaching than the Declaration of Independence, some phrases of which come from the similar Mecklenburg Declaration. On April 12, 1776 steps were taken to set up an independent government. Important battles of the Revolution were fought in the Carolinas. After 10 states had ratified the new federal Constitution in 1788, North Carolina refused (vote was 184 to 84) to agree until a bill of rights was added and other changes made. When these were guaranteed, North Carolina ratified in November 1789.

South Carolina as a Royal Colony. Charleston, the first settlement in the Carolinas, became an important center after 1725. Trade in deer skins, indigo, and rice became large, while the arts of the theatre and music made Charleston the center of culture in the south. Legislative troubles continued, until the lower house assumed much of the power to initiate laws, and complete control over financial bills. The dispute over whether the assembly or commons (said to be a model of the British House of Commons) had sole rights in finance gave the colonists additional courage. A volunteer provincial congress in 1775 took over the government, and the royal governor fled.

Various military expeditions and wars had inured South Carolina to stand loyally with the other colonies during the Revolution. Considering size, remoteness, and resources, more important battles were fought on the soil of this state than on any other, some being Ft. Moultrie, siege of Charleston (two months in 1780), Camden, King's Mountain, Cowpens, and Eutaw Springs, most of them in the campaign of General Greene, assisted by natives like Sumter, Marion, and Pickens. Wars in previous years were the Spanish in 1686, 1702, 1740, with pirates in 1717, with Indians in 1715, 1760–61, and a slave uprising in 1739. As in the case of North Carolina, the eastern low-

lands and the western hilly regions for many years were at strife. Consequently, in 1790 a new capital was set up at Columbia, but until 1865 both the state officers and the supreme court maintained sessions at both Columbia and Charleston, to represent each section separately. For many years also control of one house rested with representatives from the lowlands, and of the other, from the mountain regions.

Georgia. Once more religious and social restrictions led to the formation of this colony, the last of the original 13, and the only one founded after 1700. The British government wished to protect the Carolinas from incursions from the Spanish in Florida and the French in Louisiana. For centuries persons unable to pay their debts had been thrown into prison, while their families suffered privations. Col. James Edward Oglethorpe moved in Parliament that a committee investigate this practice. As a result George II gave the charter to lands between the Savannah and Altamaha Rivers and west to the Pacific. Parliament contributed £10,000 and individuals much more. Led by Oglethorpe himself, a company of about 100 landed at what is now Charleston early in 1733, made a treaty with the Creek Indians, and proceeded to lay out Savannah. Religious refugees from Europe and from some of the colonies also emigrated to Georgia, while some settlers from Virginia and the Carolinas came down in 1753.

When military posts were built between the Altamaha and St. John's Rivers, the Spanish in Florida were angered. While again in Europe, Oglethorpe was given permission to raise a regiment to defend the Georgian borders. Aided by men from South Carolina, by Indians, and others, he succeeded twice in driving the Spanish back to the gates of St. Augustine, oldest city perhaps in North America, founded in 1565.

As a commercial venture, Georgia failed to succeed. It was taken over as a royal province in 1753. Lands had been leased on a military basis to males only prior to 1759. Profits were supposed not to go to the proprietors, whose lease was for 21 years only. Imports of rum were forbidden, and of slaves previous to 1753. Trade with the Indians was limited to licensed persons. Attempts were made in vain to produce hemp, silk, and medicinal plants.

Great prosperity followed when the crown assumed control in 1753. The last colonial governor, James Wright, declared that this was "The most flourishing colony on the continent." Led by some settlers from Dorchester, Massachusetts, residents in St. John's parish joined with other colonists in the Revolution. Feeling for the motherland was so strong, however, in Georgia that five out of the 13 parishes sent no representatives to the first provincial congress, and the elected delegates to the Continental Congress did not claim their seats. Yet in 1787 Georgia was a strong advocate for the central government. That state was the fourth to ratify the new Constitution, and one of only three by a unanimous vote. In *Chisholm vs. Georgia,* however, this state first questioned the right of a citizen of one state to sue another state, a contention that was written into the 11th amendment in 1798. Troubles also over land west of Georgia claimed by the state and also lands once held by the Cherokee Indians were settled by payments of money to Georgia.

We have now traced the founding of the original colonies. When they united in the conflict with England, it was on grounds of longstanding disputes. While the colonies were small and poor, Great Britain was content to allow much local liberty of government. As lands became valuable and their products of more value in Europe, more and more the proprietors, and officials of settlement companies, and crown ministers tightened their holds, until at last the colonists could stand it no longer. Though they had been founded through quite diverse motives, by people that differed greatly in social and religious traditions, in the end all saw the chance of joining for a common good in forming the United States of America.

United States, Formation of. After 1688 colonial government was somewhat reorganized in favor of greater freedom for the American colonists. Massachusetts obtained a new charter uniting with Plymouth in 1691, New York and New Hampshire became royal provinces as did South Carolina in 1719, North Carolina in 1729, and Georgia after 1752. Connecticut and Rhode Island continued under original charters, as they also did after the Revolution. Colonial assemblies remained, with an upper house and a governor representing the crown. Following troubles as to commerce and trade, Great Britain withdrew some colonial privileges, and after 1763 passed various obnoxious acts. Meanwhile, the spirit of liberty grew in England, and, as Edmund Burke pointed out, the Americans after all were Englishmen, with similar love for freedom. So conditions remained up to the beginning of the Revolution.

Continental Congresses. Opposition to the Stamp Act and others led Britain to quarter General Gage and his soldiers in Boston. This unwise move irritated the colonies, so that all but Georgia joined in a Congress which sent protests to the crown and ministry. All agreed to support Massachusetts, even by force of arms, against encroachments from abroad. The English Whigs tried to obtain conciliations, led by Burke in his famous *Speech.* The policy of Lord North, however, was finally approved. The latter proposed that any colony setting up a self-government and contributing to the common defense should be freed from taxes imposed by England. Matters had gone too far, however, and Concord, Lexington, and Bunker Hill began the Revolution in April of 1775.

Even before hostilities commenced, delegates had been chosen for the second Continental Congress. United at first for common advantages in trade and commerce, the colonists now united for common defense. Congress at once began to urge, and in some cases to command, certain measures, and Washington was appointed to organize the army. Royal governments in the colonies had already begun to break down. Virginia adjourned the House of Burgesses in May of 1774, and never called it again as a royal assembly. Massachusetts followed in October, New York in March, 1775,

North Carolina in April, Georgia in May, and New Hampshire and South Carolina in June. Governor Franklin met the New Jersey assembly in November, but all important functions had been taken over by a colonial group. So one can see that the colonies were ready to unite.

Independence Proclaimed. Lack of success during the first year of the Revolution gave the Tories a chance to resist the growth of popular assemblies. Meanwhile, Congress courageously issued bills of credit amounting by 1779 to over $240,000,000, and the states over $200,000,000. Some jealousy sprang up among the colonies, New York put into the field a considerable force opposed to independence, and affairs looked sad for the colonies until 1777. Only by the financial aid of Spain and Holland, and the financial and military aid of France, could the Revolution have succeeded by keeping England busy with a war at home.

On June 4, 1776, Richard Henry Lee of Virginia, in the Congres, offered a resolution "that these United Colonies are and of right ought to be free and independent." The ensuing debate showed that a few states had not instructed their delegates how to vote. After three weeks delay, all but Georgia, South Carolina, and New York voted to break with England. When the British attacked Charleston, Georgia and South Carolina joined the other colonies. On July 4, 1776, the Declaration of Independence, written largely by Jefferson, was adopted, but New York took no part. A convention a bit later agreed to the declaration and the signatures of all delegates were later appended.

National Development. Congress was hampered by lack of means, of money, and of international standing. When Henry Laurens was captured in 1779 by England while on his way to represent the colonists in Holland, the new nation gained definite support of other governments. The state governments took form gradually, while rights of assemblies of people were clearly defined as never before by Great Britain. Most states passed a general bill of rights, provided for trial by jury, freedom of press and speech and of assembly, and forbade monopolies and hereditary titles or grants. The Articles of Confederation, as proposed after Burgoyne's surrender in 1777, were ratified after the large states had given up certain concessions, among them their claims to western lands, as Maryland insisted till the point was won, but they did not go into effect until 1781. Congress thus came into possession of 430,000 square miles of public domain. The Ordinance passed July 13, 1787 provided for much of later development of states. (See reasons why the Articles failed in department of Government.)

Congress and the States. Taxation and import duties proposed by Congress brought to a head the conflict with the states, some of which refused all cooperation in one matter or another. Issuing of paper money had all but bankrupted several states. In 1784 Congress adjourned, having been unable at times to get a quorum and at others to get nine of the 13 states, as required, to agree on a measure. Then followed at Annapolis, Maryland, a convention of five states, which recommended the Constitutional Convention, finally held at Philadelphia in May 1787. New York had blocked all attempts of Congress to levy an impost. All but Rhode Island were represented at Philadelphia. Virginia as a large state proposed one house as before but with enlarged powers. Connecticut proposed a compromise, out of which grew our form of government.

New Government. Fifty-five delegates attended the Constitutional Convention of 1787. From May 28 to September 17, various committees and plans were considered. Washington presided, Franklin at 81 was the eldest member, Gilman of New Hampshire, only 25, was the youngest. Many of the delegates afterward became important in the development of the new nation. Some of these were Washington and Madison, who became presidents, Elbridge Gerry, who became vice president, Rufus King the candidate for second place in 1804 and 1808, and for president in 1814, Landgon, a candidate in 1809 and Jared Ingersol, also for vice president in 1812, also C. C. Pinckney in 1804, 1808, and 1812. Langdon was the president of the Senate. Randolph was first attorney general, Hamilton first secretary of the treasury, M'Henry the second secretary of war. Ellsworth and Johnson became first senators from Connecticut, Robert Morris from Pennsylvania, Caleb Strong from Massachusetts, Patterson from New Jersey, Dickinson and Bassett from Delaware, Pinckney and Butler from South Carolina, and Col. Few of Georgia; while Sherman of Connecticut, Gilman of New Hampshire, and Baldwin of Georgia became first representatives and later senators. Those who became governors were Morris of Pennsylvania, Gerry and Strong of Massachusetts, Patterson of New Jersey, Basset of Delaware, Spaight and Davie of North Carolina, Pinckney of South Carolina, and Alexander twice governor of North Carolina.

Ratification was slow and progress uncertain. Delaware, Pennsylvania, New Jersey, Georgia, and Connecticut ratified without much trouble, Delaware and New Jersey by unanimous vote. New Hampshire waited for Massachusetts, where sentiment was almost equal, and in the end resulted in ratification by 19 majority out of 355. Madison, Jay, and above all Hamilton, urged adoption by the Federalist Papers which they published. On June 21, 1788, New Hampshire made the ninth state necessary to make the Constitution binding: Virginia fell into line by a majority of 10 out of 168, and in New York the majority was only two. North Carolina joined the union on Nov. 21, 1789, and Rhode Island on May 29, 1790, after remaining outside because of the religious issue which still was alive there.

Extension of Settlements. The vast northwest territory was ceded by England in the treaty of 1783. Part of New Hampshire became Vermont in 1791, Virginia's claims to the west became Kentucky in 1792 and North Carolina's claim became Tennessee four years later, heretofore this territory had been called Frankland. The ordinance of 1787 guaranteed religious liberty. So the Ohio region was opened by Arthur St. Clair in 1788, but Marietta, Losantiville (Cincinnati), and Louisville were already established.

ADMINISTRATION OF GEORGE WASHINGTON—1789–1797.

The Cabinet.—Washington was inaugurated Apr. 30 at New York City, the first capital of the U. S. His first Cabinet consisted of Thos. Jefferson, Sec. of State; Alex. Hamilton, Sec. of Treasury; Henry Knox, Sec. of War; Edmund Randolph, Attorney General.

Financial Measures.—The first and greatest problem of the administration was to provide an adequate revenue. Hamilton proposed to levy a moderate tariff on imported goods, to assume the debts contracted by the states during the Revolutionary war, to issue U. S. bonds sufficient to cover the entire indebtedness, and to charter a Bank, somewhat like the Bank of England, which should act as the fiscal agent of the Federal government.

Party Divisions—These proposals divided the political leaders into two groups, the Federalists and the Anti-Federalists or Republicans, the latter, led by Jefferson, insisting upon a strict construction of the U. S. Constitution. Hamilton, the leader of the Federalists, believed that the Constitution was created for the benefit of the whole country, and that it should be so interpreted as best to serve that purpose. Washington, after much deliberation, supported Hamilton's views, and it was due to his influence that Congress passed the necessary laws. The tariff was very low, judged by modern standards; the consolidated national debt amounted to $75,000.00; the Bank was chartered for a twenty-year term, and a mint was set up at Philadelphia. So by 1791 the U. S. was a going concern.

The Judiciary Act.—Among the most important early acts of Congress was the Judiciary Act, providing for a Chief Justice and five Associate Justices to constitute the Supreme Court; four Circuit and thirteen District Courts to make up the inferior Courts. So wisely was this law drawn up that it remained for many years unchanged in essentials.

The Constitution Amended.—Complying with pre-ratification promises, Congress passed and submitted to the states ten amendments to the U. S. Constitution, the first eight of which were known as a Bill of Rights, protecting individuals from Federal encroachment upon their personal rights. The Union was completed when North Carolina and Rhode Island came in.

A Permanent Capital Provided for.—In order to get the support of the Virginia representatives in Congress for his plan of taking over the state debts, Hamilton made an agreement with them whereby, if they supported the Assumption Bill, the national capital was to be removed to Philadelphia for ten years, and then was to be established at some point on the Potomac river, the land to be ceded by Virginia and Maryland. This is the genesis of Washington, D. C.

Neutrality in Foreign Affairs.—The French Revolution which broke out in 1789 divided the people of the U. S. into two groups, one openly sympathetic and the other hostile or favoring a strict neutrality on the part of the U. S. The fact that the French had given us decisive aid in our Revolution inclined the Americans to the support of the French in their effort to get rid of a wicked and useless nobility. As a result it took all of Pres. Washington's firmness and tact to keep the U. S. from violating established

laws of neutrality. Genet, the French representative, soon after landing began to commission American privateers to prey upon English commerce. Washington at once stopped this, although by so doing he incurred the hostility of the ardent French supporters.

Trouble With England.—To make Washington's policy the more difficult to follow through, England began to seize U. S. ships bound for French ports and confiscate their cargo. Worse than this U. S. vessels were boarded anywhere on the high seas and sailors of British birth were taken off, regardless of the naturalization laws of the U. S. In some cases native-born Americans were impressed. Washington was conscious of these indignities but he realized that the U. S. was too weak to make more than formal protests. In all probability our independence might have been seriously jeopardized if any other than a neutral policy had been followed by the U. S.

Jay's Treaty.—Washington sent John Jay to England to negotiate a treaty, and after much difficulty he persuaded the British government to make some concessions, one of which was the agreement to give up the fur-trading posts. But the treaty said nothing about the right of search and impressment, nor did it leave the U. S. free to trade with the West Indian colonies. Jay's treaty aroused a storm of opposition, and for a while Jay was the most unpopular man in the U. S.; but Washington wisely saw that half a loaf was better than none at all, and he exerted his influence in having the Senate confirm the treaty, which it did.

Mississippi Trade.—For the people of the west a more important question than naval rights was that of opening the Mississippi river, the sole outlet for the trade of the western country. Spain had been restricting our use of that stream in a most exasperating manner, and the westerners were ready either to fight Spain, or to set up a separate republic for themselves. In 1795 Spain signed an agreement whereby the Mississippi should be open to the use of U. S. citizens and New Orleans should be a port of deposit.

The Whisky Rebellion.—The word "excise" had been hateful to the Americans since pre-Revolutionary days; therefore when Congress, following the suggestion of Hamilton, imposed an internal revenue tax on distilled spirits in 1789 there was a strong protest from the people of western Pennsylvania, Virginia, and North Carolina, who had been turning their corn into whisky unmolested by Federal taxes. Collection of the tax from the western Pennsylvanians especially became so difficult that Washington had to resort to the use of troops to put down the incipient rebellion. The six or seven thousand insurgents melted away before the Federal troops, and the government had exhibited its strength in a most useful and decisive manner. Had the Federal government weakened or compromised on this occasion the new Republic might have been called upon to face a similar situation every time a section or a group objected to a Federal law.

Cabinet Changes.—When Washington became President he declared his intention of ignoring party lines—in other words, of running the government on a bi-partisan basis. Thus, the leaders of the two extremes, Jefferson and Hamilton, were members of the first Cabinet. It was a great disappointment to Washington when he found that party differences were so irreconcilable that he would have to choose between them. His own good judgment told him what the U. S. most needed at that time was strength. Hence his support of Hamilton rather than Jefferson, who would sacrifice stability for theories of democracy. By the end of the year 1793 partisan quarrels had become so acrimonious that Jefferson resigned as Sec. of State. He and Washington parted the best of friends, although there is good reason for thinking that he was responsible for the newspaper and pamphlet attacks upon the President. In January, 1795, Hamilton retired from the position which he had so ably filled, leaving office with the satisfaction of knowing that he had refuted absolutely all the charges brought against him by the Republicans. To Hamilton this country owes a debt of gratitude, for without his confidence and enthusiasm the U. S. might not have had such an auspicious beginning. His private faults were petty compared with his public virtues.

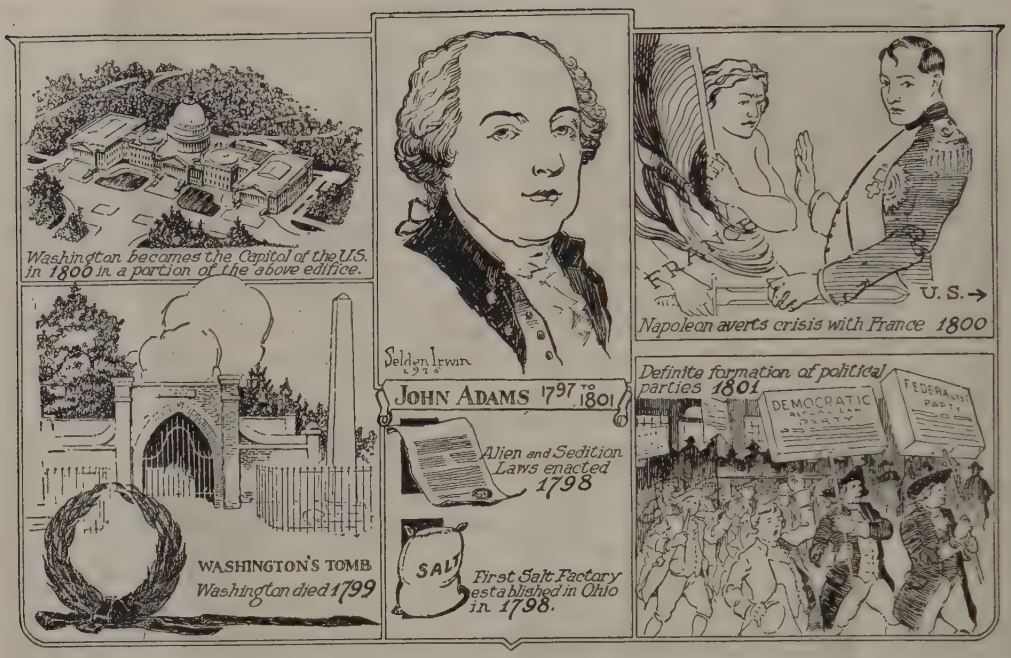
The North-West Ordinance.—The famous North-West Ordinance had been passed in 1787 by the old Congress, providing that the country north of the Ohio river and east of the Mississippi should be organized as territories until such a time as they possessed sufficient population to be admitted as states. Article 6 of the Ordinance was of great importance, providing as it did that "neither slavery or involuntary servitude should exist" in this territory.

Kentucky and Tennessee.—In 1788 Virginia consented to the breaking off of Kentucky, and in 1792 this territory became a state. Tennessee originally belonged to North Carolina but for years had been almost entirely neglected. After a vain attempt to set up for themselves without the consent of the mother state, in 1790 North Carolina gave up claim to Tennessee, and in 1796 the latter became a state.

Settlement of the North-West.—In the meantime the region north of the Ohio was rapidly filling up. The Great Lakes country was being settled by people from New York and New England whereas the settlers in the Ohio River valley came mainly from the middle states. The latter would start from the growing town of Pittsburgh, floating down the Ohio until they came to a favorable spot, where they would take up a claim.

Indian Troubles.—The new settlers had small regard for the rights of the Indians whom they found there, and warfare between the races was constant. In 1791 General St. Clair, the Governor of the Territory, was defeated by the Indians, but this defeat was redeemed later by General Anthony Wayne in the battle of Fallen Timbers.

Washington Retires.—Washington had accepted a second term with unfeigned reluctance, and so declined to consider a third term. On March 4, 1797 he retired from public office, having served in some public capacity for the greater part of his life. The Republicans welcomed his retirement with undisguised pleasure, but the mass of people estimated him at his true worth —one of the great characters of all times.



Washington becomes the Capital of the U.S. in 1800 in a portion of the above edifice.

ADMINISTRATION OF JOHN ADAMS—1797–1801

Adams's Difficulties.—The difficulties confronting John Adams, at home and abroad, were so great that his administration is a record of little else than party strife and foreign humiliation. He made his first mistake in retaining Washington's Cabinet—a conglomeration of undistinguished men who were under the influence of Hamilton, the leader of the faction of the Federalist party opposed to Adams.

"War" with France.—The first external problem which Adams had to face was that of French seizure of U. S. ships in retaliation for Jay's Treaty. Upon hearing that our minister had been sent out of France Adams had Congress pass some bills designed to strengthen our army. But wishing to avoid war the President sent to France three envoys, C. C. Pinckney, Elbridge Gerry, and John Marshall. The French "Directory" refused to treat with these men on honorable terms, even demanding a bribe, so negotiations were not begun. Diplomatic relations were broken, and war appeared certain, when the French, not wishing to add another enemy to her list, consented to make a treaty, in 1800. Between 1796 and 1800, there was a virtual state of war existing, and the losses to American shipping were great.

The Alien and Sedition Laws.—The trouble with the French led the Federalists into passing the Alien and Sedition Laws, aimed at foreigners especially. The Alien Law gave the President the power to deport any alien who was deemed dangerous to the safety of the country; the Sedition Law forbade the printing of libelous statements against the Congress or the President, on penalty of a heavy fine and imprisonment. A new naturalization law extended the period of residence from five to fourteen years. Taken together, these acts infringed upon some valued American principles, and ultimately brought about the downfall of the Federalist party.

The Virginia and Kentucky Resolutions.—Jefferson, a most astute politician, lost no time in making capital of the mistakes of the Federalists, and the Virginia and the Kentucky Resolutions were the result. The Virginia Legislature adopted a set of resolutions drafted by James Madison to the effect that the states might "interpose" to stop the operation of a law of Congress. The Kentucky Resolutions asserted outright the power of states to nullify acts of Congress. Although no other states formally affirmed these doctrines at this time, these resolutions were destined to play an important part in the later history of the U. S.

The Judiciary Reorganized.—The last act of the Federalists was to pass a bill creating 16 new judgeships and relieving the Supreme Court of circuit duty. All new judges were Federalists, an inexcusable act of partisanship. Adams's last appointment was that of John Marshall to be Chief Justice.

An Estimate of the Adams Administration.—In summing up the John Adams administration it must be admitted that the four years were productive of little that was constructive. For this Adams can not be held entirely responsible; but had he been a man of tact, as he was a man of impeachable integrity, the country might have gone forward farther than it did. Adams's most solid accomplishment was his handling of the French controversy, and it is to his eternal credit that the U. S. escaped a useless and disastrous war at a time when it could least afford it.

ADMINISTRATION OF THOMAS JEFFERSON —1801–1809.

Republican Changes.—The Conservatives viewed the accession of Jefferson to the Presidency as a great calamity, but the worst fears were not realized, for, as is usually the case, the sense of power had a sobering effect upon Jefferson. The changes he made were showy, but of slight import. His inauguration was a simple affair, but pomp would have been incongruous in such a setting. The national capital consisted of a few plain buildings in the midst of a wilderness. Thus there were several reasons for Jefferson's preference for Monticello, his Virginia mansion, to Washington.

Appointments.—His first cabinet consisted of James Madison, Sec. of State, Albert Gallatin, Sec. of the Treasury, Henry Dearborn, Sec. of War, Levi Lincoln, Attorney General, and Robert Smith, Sec. of the Navy. Jefferson found himself hampered by the fact that practically all the Federal offices were filled by Federalists, and he complained that there were few deaths and no resignations. The custom of removing office-holders for political reasons was not established, and Jefferson was discriminating in his removals.

New Policies.—The Republicans had a working majority in both houses of Congress and put through their reforms without much difficulty. The whisky tax was repealed, and customs duties were depended on to bring in enough revenue to run the government. The policy of reducing the national debt was decided on, and, by cutting down expenses in decisive fashion, this was gradually accomplished.

Attack on the Judiciary.—Jefferson came into office resolved to wipe out the latest Judiciary Act, not merely because it increased expenses, but because Adams had appointed all Federalists to the judge-ships. After a bitter fight Congress repealed the Act, and the constitutional provision that judges should hold their positions for life was rendered void by the discovery that the same end could be attained by removing the office from the man.

The Tripolitan War.—Jefferson's first term is a record of great accomplishments and few failures. For years the pirates of the Mediterranean had been exacting tribute from the U. S., but in the Tripolitan War our navy put a stop to this degradation.

The Purchase of Louisiana.—The greatest of all the events of this period was the purchase of Louisiana, "the most gigantic real estate transaction of all time." In 1802 Spain broke her treaty by closing the Mississippi to American citizens, thus affecting the fast-growing population west of the Alleghanies. Jefferson knew well the spirit of the western people, so he started negotiations for the purchase of a strip of land at the mouth of the Mississippi. In 1800 Spain had ceded back Louisiana to France with the stipulation that France was not to dispose of it to any other power. Napoleon tried to establish a colonial empire, but when that failed he was so disgusted that he was ready to give up all the colonies. So when the U. S. approached him with a view to purchasing part of Louisiana he offered to sell all of it. This appealed to Jefferson's imagination, for he was much interested in exploration and discovery; but he was not sure that the Constitution gave Congress the power of buying new territory. Being a practical man, however, and forseeing the wonderful possibilities of Louisiana he arranged for its purchase, recommending

that an amendment to the constitution be adopted giving Congress the power of buying territory. The price paid was $15,000,000 and the area included parts of the present states of Colorado, Montana, Minnesota, Wyoming, Oklahoma; and all of Louisiana, Missouri, Arkansas, Iowa, Kansas, Nebraska, North and South Dakota. By this purchase the territory of the U. S. was doubled.

Hamilton Killed.—On July 11, 1804 Alexander Hamilton was killed in a duel by Aaron Burr who was protected from punishment by the unwritten law of the time.

Jefferson Re-elected.—In 1805 Jefferson was re-elected to the presidency with an electoral vote of 162 against 14 received by his opponent, C. C. Pinckney, thus indicating that the Federalist party was disappearing from the political scene. But Jefferson's second term brought him little that he could look back upon with pride.

Foreign Affairs.—Napoleon's imperial ambitions were so extensive that to defeat them almost the whole of Europe was arrayed against him. England tenaciously held out, and to put an end to Napoleon's pretensions fought him with his own weapons. The carrying trade of the U. S. was interfered with by both contending parties. By the Berlin and the Milan decrees Napoleon closed to foreign ships all the ports in the British Empire—a paper blockade, but dangerous to neutrals nevertheless. Great Britain retorted with her Orders in Council shutting out from commerce the ports of Europe under French control. Thus U. S. ships were safe in no part of the world, and the number of confiscated ships increased so fast that there seemed to be danger that U. S. vessels would disappear from the high seas. Jefferson was so pacific in disposition that he was willing to go to almost any length to avoid war.

Foreign Trade Cut Off—England's impressment of American seamen was flagrant enough to arouse almost any one to the fighting pitch, but Jefferson chose to make war in his own way, which was to cut off all the foreign trade of the U. S. In 1806 Congress passed a Non-Importation Act which prohibited trade with Great Britain and her colonies, but before there was time to test its efficiency Congress, following Jefferson's suggestion, passed an Embargo Act, practically prohibiting all trade between the U. S. and other nations. No vessel could leave a port of the U. S. without giving bond that she was bound for another port of the U. S.

New England Objects.—New England was outraged by this action, which threatened to cut off the chief source of revenue; but Jefferson held firm and the Embargo was nominally in force for several years, during which time smuggling became common.

Failure of the Embargo.—Jefferson had hoped that the Embargo would so cripple the manufacturing interests of England that they would force the government to modify its policy toward the U. S., but in this he was disappointed. Moreover, England's shipping trade gained by the embargo, since it was entirely free from American competition. The results of the Embargo in the U. S. were disastrous. An important industry was wiped out, and the chief source of revenue of the U. S. was diminished by more than half.

Home Manufacturing.—There were several other effects that were of more lasting importance. Cut off from imported manufactured goods, the people of this country hastened to make such goods themselves; and in a short time New England had begun to lay the foundation for the activity which was destined to give her a pre-eminent place in the economic world.

Westward Migration.—Another effect of the Embargo Act was that of hastening the settlement of the western country. The sea-coast population turned toward the west, and the years immediately preceding the War of 1812 were marked by a shifting of population from the east to the west. The states north of the Ohio river filled up rapidly, and each new wave went a little farther west than the preceding one.

The National Pike.—In 1803 Ohio was admitted to state-hood. An immediate result was the construction of the first highway built in the U. S. by the Federal government. In 1806 Congress appropriated $30,000 for a road to be built from Cumberland, Maryland, to the Ohio river at Wheeling. Construction began in 1811, and by 1818 it had reached the Ohio, with the result that travel between the seaboard and the west increased enormously. Other sections of the country, observing the benefits to the communities immediately affected, made efforts to secure money for similar purposes, and the subject of public appropriations for local undertakings became one of the questions that Congress confronted at every session.

The Lewis and Clarke Exploration.—Jefferson was instrumental in setting on foot the famous Lewis and Clarke expedition to the Oregon country. These two officers of the U. S. army, after training intensively a small force of men, left St. Louis in 1804; went up the Missouri river to the Bitter Root Mountains; made their way laboriously across the Rockies until they came to one of the tributaries of the Columbia river, and followed it to the mouth. They reached St. Louis in 1806, completing one of the most successful explorations that history records.

The Fur Trade.—The effect was that the fur-traders now extended their activities to the north-west, thus bringing them into contact with the subjects of Great Britain who were plying a similar trade in that region. For a number of years the Oregon country was a live subject of dispute, and more than once threatened to disturb the relations between the U. S. and Great Britain.

Jefferson Retires.—In 1809, the Embargo Act proving a failure, a Non-intercourse Act was passed. A few days after, Jefferson retired from the Presidency, having declined to be a candidate for a third term.

Jefferson's Influence.—The influence of Thomas Jefferson upon the political philosophy of the U. S. has been greater than that of any other man. His doctrine that "the government is best that governs least" has played a powerful part in strengthening the natural individualism of the American people. He was viewed as a radical by his contemporaries, but if he were living today he would be considerd almost reactionary. To the end he believed that government at best was a necessary evil.

ADMINISTRATION OF JAMES MADISON—1809–1817.

Madison's Election.—Madison was Jefferson's personal selection, the Republican Congressional caucus obediently voting as Jefferson desired, although George Clinton of New York was rather more popular than Madison whose reticence and soberness had kept him from being better liked. Madison had been in public life for the greater part of his manhood and no man called to the Presidency has excelled him in thoroughness of preparation. His services to the country in the Philadelphia Convention entitled him to the highest gift the country had to offer. But he was unfortunate in being called upon to preside over the nation at a time when our foreign relations were in a most disturbed state.

Relations with England.—For a time in 1809 it seemed that the differences with Great Britain might be composed, for the British minister to the U. S. agreed that if the U. S. cut off France from trade the Orders in Council would be repealed. The Non-intercourse Act was repealed, and American ships prepared to take advantage of this promise of the restoration of trade, when word came from England that the British government had disavowed its minister's agreement. So the Non-intercourse Act was renewed, and the two nations drifted gradually into war.

Relations with France.—Napoleon's actions were even less excusable than England's, for he pretended to repeal the Berlin and the Milan Decrees, hoping thereby to seize foreign ships that would take him at his word. Madison tried to get England to withdraw her Orders but she refused on the ground that France was not acting in good faith, as it soon proved. As our Non-intercourse Act had been repealed so far as it applied to France, we were now put in the position of favoring one belligerent over another. That Madison had been trapped by the unscrupulous French Emperor there can be no doubt, and the effects were such that a war with England came to be recognized as certain to happen.

Indian Raids.—Added to the trouble over the impressment of our sailors and the searching of our ships there was another sore spot that touched the Americans almost as much as the other two. The Indians in the Northwest had been causing the white settlers much alarm, and there was good reason for holding the British responsible.

Events Leading to War.—In 1811 the American frigate President and the British ship Little Belt had an encounter in which the U. S. vessel worsted its opponent. Two young men, Henry Clay and John C. Calhoun, were the ardent leaders of the war-party. President Madison favored preparation for war but, with his usual caution, he backed away from the final step as long as possible. Clay and his followers, however, persuaded Congress that the time to attack England was while the latter was engaged in a life and death struggle with Napoleon, and Madison was borne down by the impetuosity of their attack.

War with England.—June 18, 1812, Congress passed a declaration of war against Great Britain, and once more the nation was called upon to face in battle its over-seas cousins. That the war was unnecessary is the opinion of historians today, especially in view of the fact that five

days after Congress had declared war Great Britain withdrew unconditionally her offensive Orders in Council. This action came too late, for the war-party was resolved upon war at all hazards.

The Unpreparedness of the U. S.—To say that the U. S. was not prepared for war would give little idea of the total unpreparedness of this country. The army of 6,000 was poorly drilled and worse armed. The navy consisted of a few ships which could by courtesy be called ships-of-war, but which were wholly inadequate to meet on equal terms a great navy such as England possessed. In addition, our finances were not in shape to stand the drain of war expenditure, and the settled opposition of the Americans to heavy taxes made the raising of the necessary funds an almost impossible task.

New England Opposes the War.—If all these discouragements were not enough, Federalist New England gave evidence of a disposition to withhold her support altogether. That section persisted in calling it "Mr. Madison's War," and gave little support to the cause. Worse than that, not a few New Englanders engaged in commerce with the enemies of their country, which made their refusal to enlist and contribute to the support of our army seem a slight offence.

Early Failures.—With these handicaps the government prosecuted a war that brought us little glory and no shame. Our first plan of campaign was to get possession of Canada, in which General Hull, an old Revolutionary officer, failed utterly. Not only that, Michigan was soon in possession of the enemy, and Ohio was always in danger.

Naval Successes.—This disaster was forgotten when the people learned that the U. S. ship Constitution had defeated the British frigate Guerriere, an occurrence almost unheard of in British sea annals. Following this there occurred the battle of Lake Erie when the U. S. squadron under the command of Commodore Perry wiped out an enemy fleet off the coast of Lake Erie near Sandusky, Ohio. The results of Perry's victory were immediately apparent for the British made no further effort to attack the Ohio country and soon gave up Detroit and most of Michigan. Another notable victory of the Americans was that of Captain McDonough's on Lake Champlain where, by defeating a British squadron, he prevented a contemplated invasion of New York.

England Indifferent Toward the War.—This was in the early part of 1814 when the outlook for American success was dark indeed. Napoleon had been defeated at Leipzig in the Battle of Nations, and Great Britain found herself free to deal with the Americans. The worst might have occurred if the British had been interested sufficiently; but when the hero of Waterloo, the Duke of Wellington, objected to taking command of the British forces operating against the Americans the British government declared its willingness to discuss terms of peace.

U. S. Invaded.—While preliminary negotiations were under way the Americans, after the battle of Lundy's Lane, withdrew from Canada and the British invaded Maryland and Virginia. Washington was captured and the Capitol and the White House were burned in reprisal for a similar act of the Americans in Canada. They made an attack on Baltimore but failed because of the protection afforded the city by Fort McHenry. "The Star-Spangled Banner" was the result of this thwarted attack, as its author, Francis Scott Key, took part in the defense of Baltimore, and was inspired to write the now-historic words of our national anthem when the British sailed away.

The Hartford Convention.—Encouraging incidents were few, however, and the Hartford Convention came as the climax. In December 1814 representatives from five New England states met at Hartford, Conn., to protest against the war. The doctrines set forth in the Virginia and the Kentucky Resolutions were affirmed as the true basis of our government, especially the right of the states to nullify laws of Congress. The right of the states to secede from the Union was hinted at, and certain amendments to the U. S. Constitution were suggested, dealing with the control of the states over some matters which had heretofore been left to Congress, especially war-powers and the admission of new states.

The Battle of New Orleans.—The last battle of the war, General Andrew Jackson's victory over General Packenham at New Orleans, was fought two weeks after the Treaty of Ghent had been signed so it had no effect upon peace negotiations.

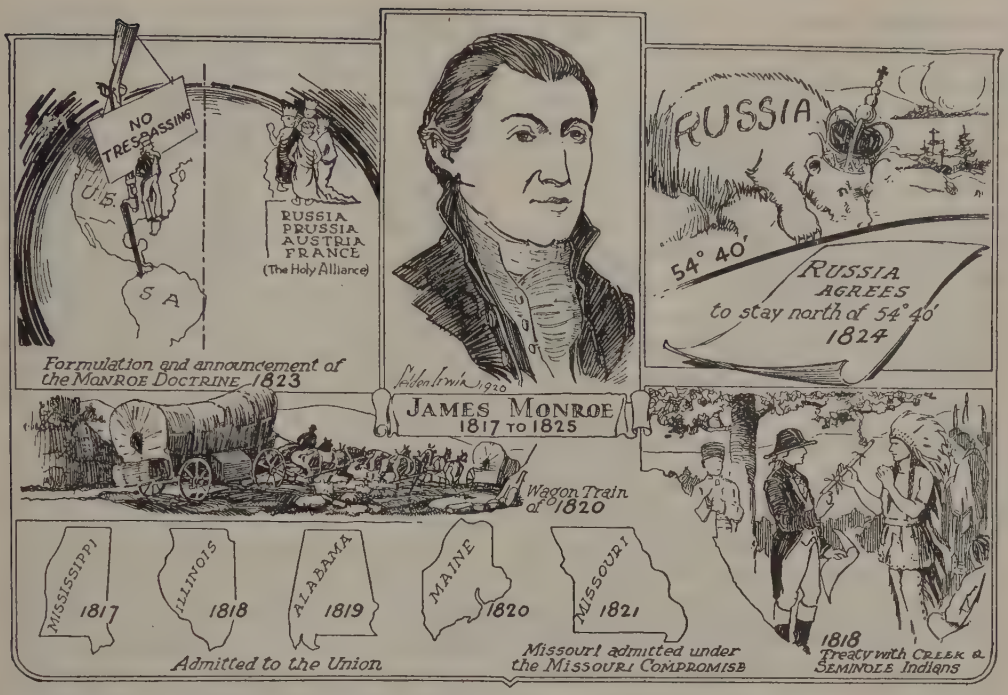
The Treaty of Ghent.—The American commissioners sent to arrange terms of peace with Great Britain had been instructed to secure at all costs a promise from the British that they would give up impressment of our seamen; but we were in no position to dictate terms, and had to be satisfied with a treaty that did not mention any of the important points of dispute. The Treaty of Ghent thus merely ended the war without settling anything.

The Cost of the War.—But if the U. S. gained nothing by the war she also lost little. The total number of men killed was less than 2,000, and the war-debt, large as it was, did not prove a serious burden in the prosperous years that were to come.

Effect of the War Upon Manufacturing.—During the war Americans had begun to engage in the manufacture of articles which England had been exporting. When the war ended English manufacturers sent over great quantities of these goods, and the American producer was threatened with extinction.

The Tariff of 1816.—This led to the demand for a higher tariff, and in 1816 the duties on iron, cotton, woolen goods, paper and sugar were increased. President Madison, laying aside his old beliefs for the time, approved the measure, which proved inadequate to protect the native manufacturer. So the tariff question becomes a live issue in our politics.

Madison Retires.—In 1817 Madison retires from the presidency, quite willing to hand over the responsibilities of the office to some one else. He had served the country to the best of his ability, and it is no detraction to say that his eight years as President added nothing to his reputation. The times required a man of action rather than a student of government.



ADMINISTRATION OF JAMES MONROE 1817–1825

The Era of Good Feeling.—The Hartford Convention had destroyed about all that was left of the Federalist party, so Monroe was elected with the votes of all but three of the states. For the first time in our history the country was free from strife of party, and when in 1817 Monroe made a tour which took him to all sections of the land, he even received a warm welcome in New England. The late war had helped to develop a stronger sense of nationality, and Monroe benefitted by it. The people turned away from European conflicts to domestic affairs, and undisturbed by foreign affairs they devoted their energies to the task of developing this huge empire.

The Missouri Compromise.—We hear little of the slave question in the first thirty years of our history. It disturbed the framers of the Constitution for a brief time, until they adopted the compromise whereby the slaves were to be counted as three-fifths in apportioning representation in the lower house of Congress. There was a clause in the Northwest Ordinance, adopted in 1787, prohibiting slavery in the territory north of the Ohio river. The Pennsylvania Quakers had petitioned Congress in early days to abolish slavery, and even the Southerners had been ready to admit that slavery was an evil institution. In 1793 Congress passed the first Fugitive Slave Act providing that escaped slaves must be returned to their masters, and the same year Eli Whitney invented the cotton-gin, which, unfortunately, by making profitable the raising of cotton perpetuated slavery for seventy years more. In 1808 Congress prohibited the bringing of slaves into the U. S. The first real slavery contest occurred in 1819 when a bill to admit Missouri as a state was being considered by the House of Representatives. Tallmadge of New York offered an amendment to the effect that there should be no further introduction of slaves into Missouri and that slaves born in the state after its admission should be free at the age of twenty-five. This provision passed the House but was rejected by the Senate, and the bill was carried over to the next session. In the meantime the entire country had been aroused to the importance of the issue. The question most discussed was whether or not Congress had the right to regulate a domestic concern such as slavery, the South taking the position that such interference did violence to the rights of states as reserved by the Constitution. The anti-slavery men argued that Congress could impose any conditions it saw fit on new states, and that the states north of the Ohio had come into the Union with a similar restriction. In the session of 1819–20 the bill to admit Missouri was tacked on to the bill to admit Maine, the latter having received the consent of Massachusetts to break away. The debate was bitter in the extreme, and led Jefferson, then in his old age, to predict that the Union would eventually be broken up over the issue of slavery. The question was finally settled by a compromise whereby Missouri was to be admitted as a slave state, but there were to be no more slave states west of the Mississippi and north of the parallel 36–30. Missouri promptly adopted a constitution which embodied the provisions of the strict slave codes of the southern states, including the prohibition of emancipation and the coming in of free negroes. Congress refused to admit

Missouri unless these provisions were taken out, but a second compromise was adopted binding the Missouri Legislature to the promise that these provisions were not to interfere with the rights of citizens under the Federal Constitution.

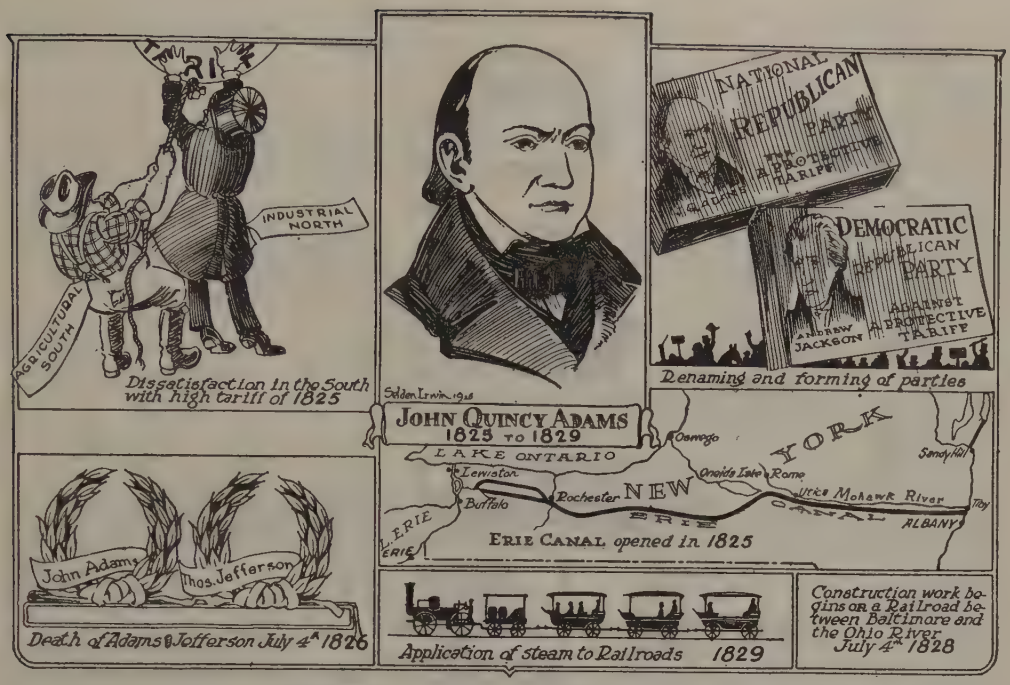
The U. S. Constitution Broadened.—Chief-Justice John Marshall, in many notable decisions, may be said to have breathed the breath of life into the Constitution. The Jeffersonians had asserted that the words of the Constitution must be taken literally, and Congress especially was held to doing only those things specifically enumerated in the Constitution. Thus their contention that Congress could not charter a National Bank. The Hamiltonians said that one power might be implied from another, and the Constitution was made to serve as an instrument of government. John Marshall in a series of decisions, especially Marbury vs Madison, Cohens vs Virginia, Gibbons vs Ogden and McCulloch vs Maryland, broadened the scope of the Constitution to include many powers not heretofore considered to be exercisable by the Federal government. In general terms, Marshall's doctrine was that Congress could exercise any powers which seemed necessary in order to carry out to the fullest extent the powers vested in Congress by the Constitution. The effects of John Marshall's opinions were far-reaching, and, although "strict constructionist" decisions are not uncommon, as a usual thing the U. S. Supreme Court is inclined to take the broader view.

The Purchase of Florida.—The acquisition of Louisiana only served to whet the appetite of the people of the U. S. Near at hand lay Florida, which had changed hands several times and now seemed destined by nature to be a part of the U. S. Jefferson had always claimed that West Florida had been included in the Louisiana territory, but Spain, which now possessed Florida denied the claim. In 1810 an uprising in West Florida caused Madison to instruct the authorities of New Orleans territory to take over that part of Florida lying between the Perdido and the Mississippi rivers. Spain was too weak to do more than make a protest, to which the U. S. paid no attention. East Florida was over-run by a motley crowd of Indians, escaped slaves, and desperate characters of all sorts who gave the states bordering on Florida much trouble. In 1817 General Jackson was sent to quell the Seminoles, which he easily did. His execution of two British subjects, Arbuthnot and Ambrister on the charge of spying might have brought on another war with England if that country had felt belligerently disposed. The U. S. was now in virtual possession of all Florida and, being unable to resist the U. S., Spain made a treaty of cession by which we were to obtain Florida for $5,000,000, most of which was to be turned over to Americans who had old claims against Spain. The boundary between the U. S. and Mexico was fixed as running from the mouth of the Sabine river to the forty-second parallel of latitude, thence to the Pacific. The U. S. gave up all claims south and west of that line, and Spain gave up her claims east and north.

The Monroe Doctrine.—During the Napoleonic wars some of the South American colonies of Spain had taken advantage of the difficulties of the mother-country to declare their independence. By 1822 Venezuela, Buenos Aires, Colombia, Peru, and Chile had been recognized by the U. S. as independent states, but they had to face the hostility of the combination of European powers known as the Holy Alliance. Great Britain, having succeeded in gaining the larger part of the trade of these states, refused to enter the Alliance; and when, in 1823 it became apparent that an effort would be made to re-conquer these newly-formed states, Canning, the British Foreign Secretary, suggested that the U. S. warn off all European powers from the American continent. To Monroe this seemed a wise suggestion, and acting upon it there was enunciated the famous Monroe Doctrine which stated in effect that the American continent was not open to conquest, and the U. S. would view any such attempt as an unfriendly act. By 1822, when the Doctrine was promulgated, the U. S. was strong enough to command the respect of the world, and the South American colonies were left to work out their problems as independent states.

Internal Improvements.—Should the Federal government build roads, construct canals etc., or should these matters be left to the states most concerned? This question was a live one for a number of years, and was not definitely settled until the Civil War placed the Republican party in power for a long term. In 1816 Congress passed the Calhoun bill providing for Federal construction of a system of roads and canals which could be used in time of war to transport men and goods from one part of the country to the other. Madison vetoed the bill on the grounds that Congress did not have the power to appropriate money for local purposes. He suggested that the Constitution be amended to give Congress that power. In 1822 Monroe vetoed a bill making a small appropriation for the repair of the National Road, but in 1825 he signed a bill extending this road from Wheeling to Zanesville, Ohio. The advocates of internal improvements, led by Henry Clay, argued that all sections of the country would benefit by the construction of such works, while the opponents were equally sure that public taxes would be spent in such a way that most sections would get nothing from them. The west strongly supported Clay's position, the south was opposed, and the east was rather indifferent and divided.

The Tariff.—Clay again took the lead, this time urging that the tariff be high enough to afford complete protection to the American manufacturer. He said that all sections would gain, even the agricultural, which would find a better market for their products. The argument of the other side was that only the persons interested in manufacturing would benefit; that the higher prices resulting from the cutting off of foreign competition would add to the cost of living without there being any corresponding advantage. On this issue the South was opposed to high tariff, the west was inclined to favor it, and the east, adverse at first, saw ultimately that they had the most of all to gain. In 1824 a bill was passed increasing the duties on wool, woolen goods, hemp, pig-iron, and iron manufactures.



THE ADMINISTRATION OF JOHN QUINCY ADAMS—1825–29

The Election of Adams.—A number of candidates for the Presidency appeared in 1824, but none of them was prominent enough to secure a majority in the electoral college. Votes were cast for John Q. Adams, W. H. Crawford, Henry Clay, and Andrew Jackson. Thus the election was thrown into the House of Representatives, as provided for by the Constitution, each state getting one vote. Jackson had received the greatest number of electoral votes, but Clay, who did not like Jackson, used his influence to elect Adams, who got the vote of thirteen of the twenty-four states. This election embittered Jackson, who accused Adams and Clay of forming a corrupt bargain, through which Clay became Secretary of State.

The Rising Tide of Democracy.—During the first thirty years of our history the propertied class controlled the government by reason of the fact that in most states only those who had property could vote or hold office. As the states one by one abolished this qualification and adopted universal manhood suffrage our governments, state and national, underwent a change. The people of the west, where there were few persons of wealth, led in this democratic movement, and their first great leader was Andrew Jackson, who successfully capitalized his popularity. The Jeffersonians were less democratic in practice than in theory, and the now-defunct Federalists had been frankly aristocratic. So a new party, or several of them, had to arise to appeal to the new class of voters. Jackson's party, the Democratic, stood for equality, and opposed privilege in all forms. Thus it drew to it the people of the west, and the working people of the east, besides a share of the southerners. The National Republicans, Clay's party, was scarcely able to compete with the party that professed to stand so strongly for the rights of man.

Tariff Legislation.—The preceding tariff had failed to protect the American manufacturers as much as was expected, so a new demand was made for higher duties. At this time the east was divided on the tariff issue, so when the leaders were framing a bill they took this into consideration and bid for eastern support. The duties were made much higher than any one expected they would ever be put, but after some political maneuvering, the Tariff of Abominations was passed. The south was angered at this disregard of their interests, and it is true that this measure discriminated against that section, as most high tariffs have done.

Internal Improvements.—Adams was an ardent "nationalist," and favored everything that would tend to draw together the different sections of the country. So he advocated some construction of roads and canals wherever they might serve this purpose. Jackson and his supporters opposed this policy and made an issue of it. One might think that since the west was most interested in such improvements Adams would be popular there, but such was not the case, for he possessed to a marked degree the bluntness and tactlessness that had made his father unpopular. During his four years in office there was little constructive legislation accomplished, due partly to the fact that he was not able to form an "administration party," without which no President can be influential.

ADMINISTRATION OF ANDREW JACKSON
1829–37

The Election of Jackson.—Adams destroyed all hope he might have had of re-election by refusing to "play politics." He would not contribute money to the campaign fund or make speeches. As a statesman Adams takes high rank, but as a politician he was a failure, so Jackson, a master politician, won easily, receiving 178 electoral votes to 82 for Adams. Jackson got the votes of all states west of the Alleghanies, and was the undoubted choice of the people of the U. S.

A New Regime.—Before Jackson's day removals from public office for political reasons had been few, and the practice was frowned upon. Jackson's belief that one American was as good as another to hold office established the principle of "rotation in office," by which it became customary for each in-coming President to remove all office-holders who were of the opposite party. A most vicious system was thus fastened upon the country, and we are not altogether rid of it today. At the time of Jackson's accession thousands of office-seekers poured into Washington and received a welcome from their idol who liked the importance of his position. Removals began at once, and caused great hardship among the Federal employees who had considered themselves fixtures so long as their work was satisfactory.

South Carolina Nullification.—Was there any way by which the states could prevent the enforcement of an act of Congress to which they objected? This old question had been answered affirmatively by Jefferson and Madison in the Virginia and the Kentucky Resolutions and by the Hartford Convention in 1814. It bobbed up again in 1828 when South Carolina resisted the Tariff Law of that year. There can be little doubt that the south was injured by high tariff, but experience has shown that few laws affect all sections alike. Calhoun started the trouble by writing a broad-side entitled the "South Carolina Exposition," which was little more than the Virginia and the Kentucky Resolutions re-worded. In 1830 a notable debate took place in the U. S. Senate between Webster of Massachusetts and Hayne of South Carolina. When Hayne asserted the right of nullification Webster replied that if this was the case the Union was a "rope of sand." He said that the U. S. Supreme Court was the umpire in case a law of Congress was questioned. Jackson disappointed the South Carolinians by declaring against nullification, and when in 1832 South Carolina formally nullified the Tariff Law of that year Jackson issued a proclamation which stated that the laws of the U. S. would be enforced even though it took 40,000 soldiers to do it. Matters never went this far, however, for in 1833 a new Tariff Act was passed providing for a gradual reduction of the rates until 1842 when there should be no duty over 20 percent. The danger of disunion was over for the present, but many times in later history do we find states refusing to obey laws of Congress, treaties of the U. S., and decisions of the Supreme Court.

The Second U. S. Bank.—This bank had been chartered in 1816 for a term of twenty years; it took care of government deposits; had established branches in various parts of the country; and was controlled by a Board of Directors chosen

by the private stock-holders and the U. S. government. After a poor start it proceeded on a very successful career and contributed a great deal toward financial stability. Its branches came into direct competition with the state banks which steadily lost many of their best customers. This explains the hostility to the U. S. Bank of the people in the less settled sections of the country. Jackson, a "hard-money" man, understood very vaguely business and banking principles, and professed to think that the U. S. Bank was becoming a money monopoly. It is true that the Bank was using its influence against Jackson and had not been discreet in its opposition. So when in 1832, four years before the expiration of its charter, the Bank applied for a renewal of its charter a controversy of the bitterest kind arose. Jackson vetoed the bill that Congress passed, saying that he believed the Congress had no right to charter an institution which was in effect a monopoly. This veto became the chief issue of the presidential campaign of 1832, and Henry Clay, the nominee of the National Republicans, made the most of it. But the great American democracy was behind Jackson and, without understanding the economic questions involved, trusted Jackson implicitly. He received 219 electoral votes to Clay's 49, and, considering this a mandate from the people, continued his attack on the Bank. In 1833 he directed Duane, the Secretary of the Treasury, to withdraw the deposits of the U. S. government in the Bank and its branches and make no more deposits. Duane refusing to do this, Jackson appointed Roger B. Taney in his place, and Taney gave the necessary order. The effects were immediate, as the Bank upon surrendering its government deposits had to curtail its own loans. Business all over the country slowed up for want of funds and a money stringency of serious proportions resulted. Not content with this, Jackson openly questioned at various times the soundness of the Bank, and would not take the report of committees appointed by Congress to investigate as worthy of acceptance. The Senate, which was controlled by Jackson's enemies, Clay, Calhoun, and Webster, passed a resolution of censure against Jackson for his usurpation of powers not conferred upon him by the Constitution. Thomas H. Benton of Missouri led the fight against this resolution, and in 1837 succeeded in getting it taken off the Senate Journal.

Indian Affairs.—In 1802 Georgia ceded its western lands to the U. S. with the understanding that Indian land titles should be extinguished. By 1825 the Creeks and the Cherokees still retained nearly ten million of acres of good land. The latter had attained a rather high stage of civilization and the U. S. recognized this by making a treaty with them recognizing their right to hold land. In 1829 gold was discovered in the Cherokee country and white persons poured in. Jackson knew that the Indians could not long hold out against the whites no matter how just their case was, so he advised them to surrender their lands in Georgia and take up lands west of the Mississippi. The Cherokees objected to emigrating so Georgia, acting under a law of Congress, extended her jurisdiction over the Indian lands. Georgia passed an act prohibiting whites from residing within the Cherokee territory without a permit from Georgia. A missionary named Worcester disregarded this, was arrested and sentenced to four years imprisonment. The case was taken to the U. S. Supreme Court where John Marshall gave an opinion that the Georgia statute was unconstitutional, and that Worcester was therefore free. Georgia disregarded this decision and kept Worcester in prison until he was pardoned by the Governor of the state. Jackson was not sorry to have the opportunity of spiking Marshall's guns and refused to carry out the decision, saying, so the story goes, "John Marshall has made his decision; now let him enforce it." In 1835 the Cherokees yielded to the inevitable and gave up their lands east of the Mississippi, receiving $5,000,000 and new lands in the Indian territory. Neither the national nor the state governments had behaved toward the Indians in such a way as to be a matter of pride for us today.

Public Lands.—One of the great questions of the hour was what to do with the public lands. The old policy of selling them for a nominal sum and taking in exchange the depreciated currency of the states had broken down. Its greatest effect had been that of causing land speculation, and this had had a discouraging effect upon the serious buyer of lands. Jackson was in favor of reducing the price so that the U. S. would not make a profit on the sale of these lands, but he believed that the money paid for the land should be good money. In 1835 an order went forth to the effect that hereafter only gold and silver would be received in payment for public lands. The western banks were seriously affected by this order as they had been taking in all kinds of money, and their debtors had little specie. But for a time speculation was stopped.

Party Conventions.—The electoral college devised by the framers of the Constitution had ceased to function in anything but name after Washington's retirement, and nominations for the presidency had been made in various ways, usually by caucus of the members of the party in congress. In 1831 the Anti-Masons called a convention to nominate candidates for President and Vice President, and within a short time this became the established custom.

Jackson as President.—The place of Andrew Jackson in the history of our country is still a matter of dispute among historians. Some credit him with great virtues and few faults, while others can not overlook his temperamental deficiencies. The latter are inclined to view him as a successful politician rather than a statesman. Some even rank him as a demagogue, but the general opinion is that he was honest in his convictions. He was essentially a man of the frontier, with all the merits and the weaknesses of the west; its optimism and courage, and its distrust of wealth and indifference to the cultural and esthetic side of life. Jackson was an American product and embodied the good and the evil side of our people.

ADMINISTRATION OF MARTIN VAN BUREN
1837–41

The Election of Van Buren.—Jackson was getting old, and so declined to run for a third term, but he virtually named his successor, Martin Van Buren, a New York politician whose mind went along with Jackson's in everything. His opponent, William Henry Harrison, the Whig candidate, did not make a good candidate, and Van Buren won easily.

The Panic of 1837.—Van Buren had to suffer for Jackson's shortcomings. The attacks on the U. S. Bank and the refusal to re-charter it had been the beginning of an economic disturbance that reached its worst consequences shortly after Van Buren's inauguration. Hundreds of state banks had been established and all of them were issuing currency the volume of which increased immensely after the U. S. Bank went out of business. It is estimated that during the last year of Jackson's administration $50,000,000 of "wild-cat" currency was issued, little of which was worth anything. This inflation caused wild speculation, especially in land which the government was now selling for a dollar and a quarter an acre. The sale of this land enabled the Federal government to pay off its national debt and still have left $35,000,000. Congress provided for the distribution of this surplus among the states as a nominal loan, and $28,000,000 was paid over. This was another source of trouble for it led to the issuance of more paper money, and speculation increased in proportion. Jackson's Specie Circular brought about a sudden curtailment of loans and money of all kinds became scarce. The banks, being unable to redeem their currency in specie, shut up their doors, and many merchants did the same. To meet the crisis Van Buren called a special session of Congress but he refused to withdraw the Specie Circular, believing that the country would get along better without paper money. He proposed an Independent Treasury to handle government funds, but the banks were influential enough to keep such an act from being passed until 1840. The effects of this panic wore away gradually, but hard times recurred periodically. That they could have been avoided by a wise Federal banking system is probable.

The Slavery Question.—Following the discussion over the admission of Missouri there arose a group of anti-slavery men known as the Abolitionists. The man now commonly recognized as the soul of the movement was William Lloyd Garrison, and he had to face not only the bitterest hostility of the south, but the disapproval of most of the people of the north who believed that while slavery was an evil it could only be dealt with by state laws. John Quincy Adams, who was now in the House of Representatives, gave his valuable aid to the anti-slavery cause. Several bloody slave insurrections in the south had frightened that section into passing severe laws against free negroes. Their grievance against the Federal government was that the U. S. mails were used by the Abolitionists to carry anti-slavery literature to the south where it sometimes fell into the hands of the slaves. A Federal order stopped this, but it gave the anti-slavery men a chance to say that one of the rights sacred to the Americans had been destroyed. In 1836 the House of Representatives passed the "Gag Law," by which anti-slavery petitions could not be presented in the House. Adams fought hard against this, and in 1840 the Law was repealed.

ADMINISTRATION OF WILLIAM HENRY HARRISON AND JOHN TYLER—1841–45

The Election of Harrison.—Van Buren was nominated unanimously by the Democrats for a second term, and the Whigs, passing by Clay, nominated William Henry Harrison of Ohio. For Vice President they chose John Tyler of Virginia whose admiration for Clay was responsible for his being in the Whig party. The campaign of 1840 was one of the noisiest campaigns in our history and the Whigs made the most of the fact that Harrison was a war hero and a man of the people. He was elected by 234 electoral votes to 56 for Van Buren who even lost his own state, New York.

The Death of Harrison.—The President was nearly seventy years of age when he was elected, and not in the best of health, but undoubtedly his death was hastened by trying to please the numerous office-seekers who poured into Washington. He was the first President to die in office.

Tyler's Difficulties.—Clay, rather than Tyler, was the Whig leader, and trouble began when Clay attempted to dictate the policy that the President should follow, particularly with regard to a National Bank which Clay wanted to have chartered and which Tyler opposed as vigorously as did Jackson. A Bank bill was passed, providing the opportunity for Tyler to assert himself, which he did by vetoing it, stating that the bill was unwise and unconstitutional. Another bill was drawn up which was supposed to meet the objections of the President, but this was vetoed also. Tyler's break with his party was now complete and every member of the Cabinet except Webster resigned. As his former party, the Democratic, refused to have him back he was isolated for the remainder of the term. Webster resigned in 1843 when he found that Tyler favored the annexation of Texas.

The Tariff of 1842.—The Compromise Tariff of 1833 ran out in 1842 and the Whigs replaced it with a new measure which restored most of the rates in force in 1832. With this act the Tariff ceases to be a live subject of political discussion for many years, partly because a more exciting issue pushed it into the background.

The Webster–Ashburton Treaty.—The northeast boundary between the U. S. and Canada had never been definitely fixed and several times threatened to cause trouble between the two countries. A local disturbance, known as the "Aroostook War" brought matters to a head, and in 1842 a treaty was signed giving the U. S. 7015 square miles of the disputed territory.

The Annexation of Texas.—Texas won her independence from Mexico in 1837 and, after trying to join the U. S., set up an independent republic. France and England tried to extend their influence in Texas, and England was believed to be trying to get special trade concessions. The southerners became alarmed at the possibility of losing Texas while the people of the north were inclined to view the whole thing as a "bluff" of Texas to force annexation. Tyler reflected the opinions of his fellow slaveholders by doing all in his power to admit Texas. A treaty was made whereby Texas was to be admitted, but the U. S. Senate defeated it, and the matter was left over until the next administration. The annexation of Texas and the dispute with England over Oregon became the issues of the campaign of 1844.

ADMINISTRATION OF JAMES K. POLK
1845–49

The Election of Polk.—Texas was the big issue and both parties had to consider this in making their nominations. Van Buren spoiled his chances for the nomination by declaring against the annexation of Texas, thereby alienating the south. Clay had straddled the issue, but his strength in the north was enough to secure him the nomination. The campaign was bitterly fought but Polk won by 170 electoral votes to Clay's 105.

Texas Annexed.—Just before Tyler went out of office Congress passed a joint resolution providing for the admittance of Texas into the Union when her constitution should be accepted by Congress. Tyler at once entered into negotiations with the Texan government, and Polk, on becoming President, hastily brought the affair to a conclusion. Texas was admitted in December, 1845. Mexico at once broke off diplomatic relations with the U. S.

The Tariff of 1846.—The Democrats were displeased with the existing tariff rates and lost no time in passing a new bill which reduced the duties to a revenue basis and which remained on the statute books until 1857. The manufacturing interests were now strongly enough established to get along without high protection, and did not suffer because of the reduction.

The Oregon Question Settled.—In the campaign of 1844 the Democrats had made their slogan, "fifty-four forty or fight," but now that they were in power they adopted a more moderate attitude toward England. Polk's offer to settle on the 49th parallel as the boundary was finally accepted.

The Mexican War.—Polk was very desirous of acquiring California and New Mexico, and to that end he sent Slidell to Mexico to make an offer of $25,000,000 for California and $5,000,000 for New Mexico. We were in Mexico's bad graces at that time and the offer was never considered. The boundary between Texas and Mexico had never been settled, and Polk used this disagreement as a means of getting into war. He ordered General Taylor to cross over into the disputed territory; the Mexicans attacked an American force, and Congress declared war May 12, 1846. Taylor soon defeated the Mexicans in the hard-fought battle of Buena Vista, and early in 1847 General Scott, starting from Vera Cruz, marched through Mexico and captured Mexico City, ending the war. By the treaty of Guadaloupe Hidalgo it was agreed that the boundary should follow the Rio Grande to the New Mexican line, thence west to the first branch of the Gila river, thence with the river to the Colorado, and from that point with the boundary between upper and lower California to the Pacific. We agreed to pay Mexico $15,000,000 for New Mexico and California.

The Wilmot Proviso.—The addition of all this new territory only served to make the slavery question more acute. In 1846 and 1847 Congress was debating a resolution in the form of a proviso that none of the territory which was to be added to the U. S. was to be open to slavery. Although the proviso was ultimately defeated it set the country in an uproar and divided the U. S. hopelessly into sections.

THE ADMINISTRATION OF ZACHARY TAYLOR AND MILLARD FILLMORE
1849–53

The Election of Taylor.—The Whigs once more nominated a war-hero, General Taylor. A factional fight in New York prevented Polk from getting a re-nomination, and the Democratic convention named Lewis Cass of Michigan, a former Cabinet officer under Jackson. The anti-slavery people were not satisfied with the position taken by either of the two major parties on the slavery question, and formed the Free Soil party, nominating Van Buren. New York, by going for Taylor, decided the election. Taylor received 163 electoral votes and Cass 127.

The Compromise of 1850.—When Congress met in December, 1849, affairs were critical. California and New Mexico had not been given any status, and California had formed an irregular state government. Three courses were open: to admit them as states (or territories) without saying anything about slavery; to prohibit slavery; or to compromise. Under the doctrine of popular sovereignty slavery was a domestic question, to be settled by the people of the states or territories, and we hear much of this in the next ten years. It remained for Henry Clay to round out his long political career by proposing the terms of the compromise ultimately agreed to: California was to come in as a free state; New Mexico and Utah were to be created territories without restrictions as to slavery; the prohibition of the slave-trade in the District of Columbia; a more effective fugitive-slave law. The debate over these proposals takes rank as probably the greatest ever delivered in our Congress. Calhoun, now in his last days, spoke against the compromise. He foresaw the time when the slave states would be so outnumbered that their rights would be taken from them. Each successive decade had witnessed a decline in the influence of the south. The Northwest Ordinance, the Missouri Compromise, the protective tariff, and the general policy of Federal consolidation had all worked hardships on the south. Clay's proposals would increase the difficulties of the south. Calhoun realized better than anyone else that such a compromise could only be of temporary duration. Webster took a moderate attitude, condemning the Abolitionists for their radical views, and supporting Clay's proposals. After a three months debate the Compromise of 1850 was passed.

The Nashville Convention.—While the above matters were under consideration by Congress nine southern states met in convention at Nashville, Tennessee, for the purpose of protecting the interests of their section. Some of the delegates were ready for immediate secession, especially those from South Carolina and Mississippi, but calmer counsel prevailed, and the Convention adjourned without taking any decisive action. However it paved the way for southern co-operation later.

The Death of President Taylor.—July 9, 1850, Taylor died, worn out by the duties of his office. He had exhibited an unusual independence in his attitude toward public questions, and, although a slave-holder himself, frowned upon the southern "fire-eaters."

THE ADMINISTRATION OF FRANKLIN PIERCE—1853–57

The Election of Pierce.—With the exception of the Abolitionists and the southern extremists the people of the U. S. hoped that the Compromise of 1850 had finally settled the slavery controversy, and both the Whig and the Democratic conventions adopted resolutions to that effect. The Democrats finally gave the nomination to a "dark horse," Franklin Pierce of New Hampshire, after forty-nine ballots. The Whigs continued their policy of nominating military men by selecting General Winfield Scott. The Free Soil party also put a candidate in the field. Pierce received 254 electoral votes and Scott 42, thus proving beyond doubt that the great mass of Americans endorsed the Compromise.

Trouble over Fugitive Slaves.—"Slave-stealing" had been increasing steadily, especially after the Abolitionists had put into operation the "Underground railroad," which systematically took care of escaped slaves until they reached Canada. Not only that, but when fugitive slaves were captured in the north they were often rescued by mobs. States in the north began passing "personal liberty laws" by which the people were forbidden to aid in the return of fugitive slaves. As the Federal law on the subject directed the return of such persons these states were put in the position of nullifying a law of Congress.

The Kansas-Nebraska Controversy.—Nebraska was the unorganized territory west of Iowa and Missouri. In January, 1854, S. A. Douglas of Illinois, reported to the Senate a bill providing for two territories. When the bill passed it had been so amended that one of these territories was to be free, the other slave, and the Missouri Compromise was to be repealed. Douglas defended the measure on the ground that the people of a territory had the right to decide their own problems, and that climate determined slavery. The whole country was aroused again, and a new host of leaders arose to take the place of Clay, Webster, and Calhoun, now all dead. William H. Seward, S. P. Chase, and Benjamin Wade opposed slavery extension; Jefferson Davis and Toombs represented the interests of the slave-holders; Douglas and James Buchanan took the middle ground.

Bloody Kansas.—After Kansas became an organized territory settlers poured in, at first mainly from slave states, and the legislature drew up a slave code. An influx of New Englanders made it possible for them to set up a separate government, and the U. S. had to choose between them. Congress wrangled over the matter while anarchy prevailed in Kansas. Two hundred persons were killed in this guerilla warfare, in which John Brown took a leading part. Pierce, who was very much under the domination of the southern leaders, especially Jefferson Davis, was inclined to favor the slave party in Kansas, and denounced the free-state government as rebellious. When Pierce retired in 1857 Kansas was still disputed territory. The effect of the Kansas controversy was to bring home to the people of the country the near possibility of civil war.

THE ADMINISTRATION OF JAMES BUCHANAN—1857–61

The Election of Buchanan.—The Whigs were hopelessly disrupted. The northern and southern wings could never be brought together again. The Democratic party in the south gained by the accession of many Whigs, while northern Democrats were still inclined toward conservatism. A new party, the Know-Nothing, drew its strength mainly from the Whigs. It was principally an anti-foreign party, and may be said to be the fore-runner of the modern Ku Klux Klan. In 1854 the Republican party was formed, carrying over the principles of the Free Soil party. The candidates in 1856 were, John C. Fremont, Republican; James Buchanan, Democratic; Millard Fillmore, Know-Nothing. Buchanan got 174 electoral votes, Fremont 114, Fillmore 8.

The Dred Scott Decision.—Dred Scott was a slave who had been taken by his master into free territory and brought back to slave territory. He sued for freedom, claiming that his residence in a free state had made him free. The case reached the U. S. Supreme Court where two points were considered: was Scott a citizen of Missouri, and did the Missouri Compromise protect him? The decision of the majority was read by Chief-Justice Taney who said that Scott, not being recognized as a citizen of Missouri, was not a U. S. Citizen. Furthermore, the Missouri Compromise was null and void. A dissenting opinion delivered by Justice Curtis upheld Scott's contentions.

The Lincoln-Douglas Debates.—Lincoln first became widely known through his debates with Douglas over current issues centering around slavery. Both were candidates for the U. S. Senate at the time. Lincoln said that "a house divided against itself can not stand. I believe this government can not endure permanently half slave and half free." Douglas denounced this as Abolition doctrine. Lincoln destroyed Douglas's chances for the Presidency by forcing the latter to say that if the people of the states did not want slavery they would keep it out in spite of any Supreme Court decision. This alienated the southern Democrats, although it served to elect Douglas to the U. S. Senate.

The John Brown Raid.—After a wild career in the west John Brown went east with a crazy scheme for a slave insurrection. Receiving some aid from Abolitionists he fixed on Harper's Ferry, Virginia, as the base of operations. Oct. 16, 1859 he seized the U. S. arsenal at Harper's Ferry, only to be captured on the 18th by U. S. troops. He was hanged for starting a rebellion, and the incident might soon have been forgotten if the country had not been on the verge of war.

The Gulf States Secede.—The nomination of Lincoln, and the split of the Democratic party, making Lincoln's election almost sure, convinced the radical southerners that slavery was doomed so long as the Union in its present form existed. Seeing no hope for their cause South Carolina passed an ordinance of secession Dec. 20, 1860, and by Feb. 4, 1861 Georgia, Alabama, Mississippi, Louisiana and Florida had followed suit. They set up the Confederate States of America electing Jefferson Davis President, and Alexander H. Stephens Vice President. Buchanan, about to retire, did nothing to stop the progress of secession, as indeed there was little anyone could do.

THE ADMINISTRATION OF ABRAHAM LINCOLN—1861–65

The Election of Lincoln.—The Republicans turned away from their most prominent men, Seward, Wade and Chase, to select a candidate who had not been in public life prominently enough to have made enemies. The Democrats met in convention at Charleston, S. C., only to find that the party was hopelessly divided; so one wing met at Baltimore and nominated Douglas, while the radicals met at Richmond and nominated J. C. Breckenridge, Kentucky. With John Bell, of Tennessee, selected by the Whig-Know-Nothing party, there were four prominent candidates in the field. Lincoln was the only one who got the undivided support of his party and was elected, receiving 180 electoral votes to 72 for Breckenridge, 39 for Bell, and 12 for Douglas.

Lincoln's Inaugural Address.—The whole country waited anxiously to hear what Lincoln proposed to do. In his inaugural address he assured the South that slavery was safe, but expressed his intention of enforcing Federal laws. He denied the right of secession, but was evidently very anxious to conciliate the South.

The Outbreak of the Civil War.—Fort Sumter, at Charleston, S. C., was cut off from Union aid, and ships finally sent to Major Anderson's relief arrived too late. The Confederates bombarded the fort, and on April 13 it surrendered. War was assured and Lincoln called for 75,000 volunteers. By June all the southern states had joined the Confederacy. The border states, Maryland, Kentucky, and Missouri were held in the Union, although in all three southern sympathizers were in the majority. The north had the advantage in material supplies and number of possible soldiers. The southerners were better soldiers and went into the war with more enthusiasm.

The Battle of Bull Run.—Two large Union armies under Generals McDowell and Patterson were sent toward Richmond, and before advancing far they came into conflict with Confederate forces under the command of Generals Beauregard and Johnston. The battle at first favored the Union troops, but at the crisis the Confederates received re-enforcements and the Union soldiers began a disorderly retreat. If the Confederates had realized it they might have captured Washington. This battle served to nerve both sections of U. S. for a long struggle.

Trouble with Great Britain.—European peoples were inclined to favor the South, believing that it was a fight for freedom. European governments would have been glad to see the U. S. broken up into sections, and thus gave the South aid whenever they could. At the outbreak of the war the British government made an official recognition of belligerency which gave the Confederates a legal status in their dealings with foreign powers. The Lincoln government protested against this, but an affair of greater importance soon engaged the attention of both countries. The U. S. ship, San Jacinto, stopped the British ship, Trent, and took off two Confederate emissaries, Mason and Slidell. War between the U. S. and England was barely

averted, the U. S. disavowing the act of Captain Wilkes and restoring the Confederate agents. In the next point of dispute England was in the wrong. She permitted warships for the southern Confederacy to be built in her shipyards—a violation of international law, and these ships, the Alabama and the Florida especially, did untold damage to American shipping.

The War in the West.—General Grant was put in charge of operations in the West, and in the early part of 1862 by capturing Confederate forts on the Tennessee and Mississippi rivers drove the enemy farther south. By the middle of the year the Union forces were in control of most of the Mississippi, Admiral Farragut having taken New Orleans in April. The next year Grant renewed his operations and on July 4 captured the Confederate stronghold, Vicksburg. After a long period of severe fighting, in which the battles of Chickamauga, Chattanooga, and Lookout Mountain stand out most prominently, the whole of Tennessee was in Union hands. In Feb., 1864, the command of the army in the West was given to General Sherman after Grant was made commander of all the Union forces, and in Sept., 1864, Atlanta was taken. By the end of the year Sherman had taken Savannah and the Confederacy was cut in two.

The War in the East.—General McClellan, in 1862, tried to fight his way to Richmond but his over-caution and the excellent strategy of the Confederate leaders, Generals Lee and Jackson, made the operation a failure and he was removed from command, being succeeded by General Halleck. General Pope was put in command of the Union army in the field but the choice was a poor one, for he was completely out-generaled by Lee and Jackson. Finally at the second battle of Manassas he was driven back upon Washington and was deprived of his command. Lee now invaded Maryland and McClellan was restored to his former position to oppose him. The battle of Antietam which occurred Sept. 17, 1862, was one of the major engagements of the war, and while neither side could claim victory the Confederates were checked. Burnside now took McClellan's place with orders to move toward Richmond. He bungled the campaign and, after suffering terrible losses at Fredericksburg, gave way to Hooker who had no better success, finally being defeated at Chancellorsville. The Confederates lost more than they gained, however, for General "Stonewall" Jackson was killed. In June, 1863, the southern army started north. General Meade was put in command of the Union forces and put his army in front of the Confederates as they reached Pennsylvania. The great battle of Gettysburg lasted three days, and when it ended Lee was on his way back to Virginia. The north had been saved from invasion. In March, 1864, Grant took command of the Union armies and started for Richmond. The Wilderness campaign lasted for two months, May and June, 1864, and resulted in Grant's being checked after an enormous loss of life. With the opening of 1865 the Confederacy was fighting a lost cause. Its man-power was low; the blockade had effectually cut off supplies from foreign countries, and the war-spirit was declining. In the spring Grant renewed his attacks with an army immensely superior in numbers to Lee's, and, on April 9, 1865, Lee surrendered, virtually ending the war.

Draft Riots During the War.—The North and South both had to resort to conscription to raise enough troops. This draft met with opposition among the foreign-born people of the north, and bloody riots occurred. In July, 1863, 1,000 persons were killed or wounded and much property destroyed in riots that occurred in New York City.

How the War was Financed.—For the first time in its history the Federal government had to resort to an income tax. But expenses were too heavy to be met altogether out of taxes so bonds were sold. In addition Treasury notes were issued and made legal tender. The National Banking Act of 1863 provided for the chartering of national banks which could issue paper money, under certain restrictions. A ten percent tax levied on the currency issues of state banks forced the latter to become national banks or give up the privilege of issuing currency. In 1864 the expenses were so enormous that the government had to issue paper money to the amount of $431,000,000, besides levying taxes on almost every thing. Gold and silver were driven from circulation.

Emancipation.—From the beginning Lincoln had insisted that the war was not fought to end slavery, and he disavowed the acts of generals who took the matter into their own hands, having in mind the slave states which had remained in the Union. But by the middle of 1862 he had made up his mind that freeing the slaves would injure the Confederacy, so he decided upon it as a war measure. Sept. 23, 1862, he issued the Emancipation Proclamation, declaring free all slaves which were held in the Confederate states.

Lincoln Re-elected.—The Republicans re-nominated Lincoln in 1864, and the Democrats chose General McClellan to oppose him. Lincoln won by 212 electoral votes to 21 for McClellan.

Lincoln's Plan of Reconstruction.—Lincoln held to the theory that the southern states were not out of the Union because they could not constitutionally secede. His policy was to re-build the so-called seceded states around whatever loyal element existed in them, that nucleus being fixed by him at one-tenth of the voters of the state. Thus he insisted upon the recognition of the state of West Virginia which had been erected by a small number of Virginians living in northwestern Virginia, and whenever one of the states of the Confederacy was conquered by Union troops he proceeded to reconstruct it by urging the loyal persons to re-form the state government.

Lincoln Assassinated.—On April 14, 1865, while attending a theatrical performance, Lincoln was shot by an actor, John Wilkes Booth who crazily thought he was redressing the wrongs of the South. Lincoln died the next day. The assassin was killed and four other conspirators were executed.

THE ADMINISTRATION OF ANDREW JOHNSON—1865–69.

Johnson's Unfitness.—The Republicans had selected Johnson, a southern Democrat, as their candidate for Vice President in 1864, in order to get votes from the opposing party. The choice was unfortunate, for Johnson was cursed with an uncontrollable temper that was made worse by a fondness for liquor. His tactlessness made it impossible for him to work with the leaders of Congress, and without their support he could do little.

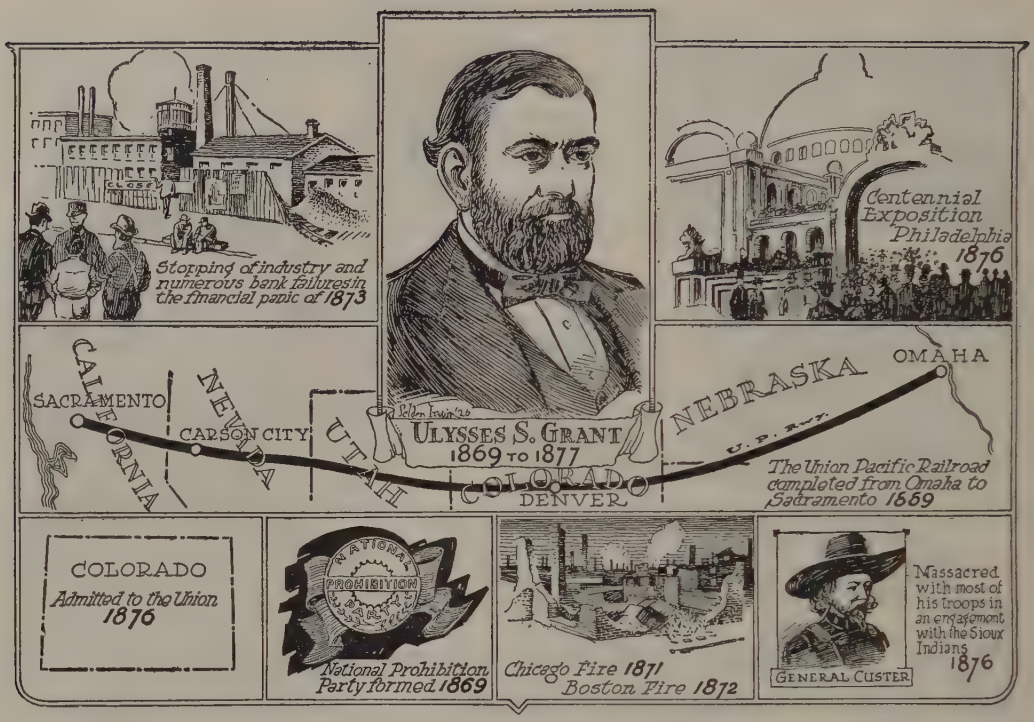
Plans of Reconstruction.—Lincoln's theory had been that the Union was indestructible, and that the so-called seceded states had never been out of the Union. His plan of reconstruction was to re-build the southern states around any loyal element that existed, and to make it easy for the disloyal to come back into their proper relation. Johnson, who had at first favored severe punishment for the "rebels," came around to Lincoln's views when he became President. The radicals in Congress, led by Charles Sumner and Thaddeus Stevens, wanted to inflict penalties upon the southerners. Congress insisted that reconstruction was a matter for it to handle, while Johnson insisted that it came under his powers. At first Johnson, having popular support, had his way, and before the end of 1865 had restored most of the former Confederate states on easy terms. They abolished slavery and repudiated their war debts. Sumner and Stevens wanted to keep the former Confederates from having any share in the state governments.

The Freedmen's Bureau.—To take care of the newly freed negroes Congress established the Freedmen's Bureau which was to act as the guardian of the blacks. Northern men and women were sent South to put the plan in operation. They frequently clashed with southerners, and the bad feeling stirred up both the North and the South to such an extent that both sections did foolish things. The negroes were led to believe that the government would take care of them.

The Fourteenth Amendment.—This provided that all persons born or naturalized in the U. S. were citizens of the U. S. and the state in which they resided, and that the states could not deprive U. S. citizens of their rights. The southern states rejected it, and this gave the radicals the chance to say that the control in the South must be taken from the whites.

The Reconstruction Acts of 1867.—Johnson's lack of dignity and tact had turned the country against him, so the radicals were able to pass a series of acts depriving the southern states of self-government and putting them under military government. Control of the southern states passed to the negroes and the "carpet-baggers," northern whites.

The Impeachment of Johnson.—Secretary of War Stanton had played false with Johnson and the latter wanted to remove him. Congress passed the Tenure-of-Office act by which the consent of the Senate was made necessary to remove a Cabinet officer. Johnson believed this to be unconstitutional, and removed Stanton. He was impeached on a number of charges, and the Senate failed to convict, lacking one vote. Historians today are more inclined to deal gently with Andrew Johnson. His plan of bringing about a reconciliation between the sections was a benevolent one, but the mis-informed public did not sustain him.



THE ADMINISTRATION OF ULYSSES S. GRANT—1869–77.

The Election of Grant.—The Republican convention nominated Grant unanimously, although he had been a Democrat. Governor Seymour of New York was nominated by the Democrats. The Republicans made the most of the lawlessness of the Ku Klux Klan and the attempts of the South to keep the freedmen down. The Democrats denounced the Reconstruction Acts and upheld Johnson's policies. Grant won by 214 to 80 electoral votes, but his popular vote exceeded Seymour's by only 300,000.

Grant's Cabinet.—The men selected by Grant for the Cabinet illustrated his unfitness for civil office. Fish, Sec. of State, and Hoar, Attorney General, were good men, but the others ranged from mediocre to very poor. Grant's love of money and his admiration for rich men, combined with a trustful disposition, made his appointments to office the worst in our history.

Reconstruction.—Grant was not in the least vindictive and would have been glad to see the South restored on easy terms. But the radicals responsible for his election were otherwise inclined and Grant followed their lead. The military governments of the South were a sore burden to the South, and may be said to have caused most of the disorder. After the native whites were disfranchised the government of the states was in the hands of the blacks and the "scalawags," who indulged in orgies of extravagance. The whites organized to meet these conditions and the entire section was in a state of anarchy. The black legislature of South Carolina spent millions of dollars for wines, whiskey, food, clothes, tapestries, rugs, etc., besides what the members appropriated for their personal use. Little wonder that the southerners rebelled. Gradually affairs went back to normal. Several amnesty acts removed the disabilities against the former Confederates and when they were restored to citizenship they wrested the government from the usurpers.

The Fifteenth Amendment.—This measure was designed to perpetuate the Republican party in power. When first proposed it was not popular even in the North, and the radicals were forced to wait until the southern legislatures were in control of the negroes before it could be adopted. It provided that the right of voting should not be denied by the U. S. or by any state on account of race, color, or previous condition of servitude. The amendment was effective only so long as the South abstained from making it of no effect, which they did before long.

Foreign Affairs.—Grant was an expansionist, and had it not been for the opposition of Sumner, chairman of the Foreign Relations committee, the U. S. would have annexed Santo Domingo. On his own responsibility he negotiated a treaty providing for this, but the Senate, much to Grant's disappointment, rejected it. The settlement of the Alabama dispute reflected credit upon both the U. S. and Great Britain. The damage to American shipping caused by the British government permitting the Confederate cruisers to be built in her ship-yards was very great, and the U. S. had never ceased to press her claims for reparation. In 1870 Secretary Fish induced Great Britain to leave the matter to arbitration. By the Treaty of Washington, 1871, the two countries left the question to be settled by a joint high commission, one representative from each of the countries concerned,

with the President of Switzerland, the King of Italy, and the Emperor of Brazil as the neutral arbitrators. The U. S. was awarded damages to the amount of $15,500,000.

Financial Disturbances.—Our national debt amounted to more than two and a half billions. U. S. paper money in circulation exceeded three hundred and fifty millions. Holders of U. S. securities did not know whether they would be paid in gold or in paper money. The western part of the U. S., needing more money for development, favored inflation; the conservative east feared the results of inflation, and favored contraction. Gold was out of circulation.

The Panic of 1873.—Speculation in gold went on until a crash was certain to come. Two New York speculators, Jay Gould and James Fisk, set about to corner the market. To make their game sure they had to keep the U. S. from selling gold, and, working through Grant's brother-in-law, they made the President's acquaintance and even entertained him in New York. They bid the price up to 162 and were about to make a huge profit when the Secretary of the Treasury began to sell gold. The price fell amid wild scenes. This was known as "Black Friday." Hard times ensued, and it was several years before the U. S. recovered.

"The Crime of 1873."—This was an act whereby silver was demonetized, and gold was made the single standard. To the people of the west this was a crime, for the effect was to tighten money at a time when the west needed it most.

The Redemption Act.—Soon after the war the government adopted the policy of retiring the "greenbacks" whenever they came back to the treasury. By 1868 the amount had been reduced to $356,000,000, and many people believed that deflation had gone far enough. In 1875 Congress passed the Redemption Act by which after January, 1879, the greenbacks were to be redeemed at par in gold if the holders desired. In 1878 Congress yielded to western demands sufficiently to enact a law whereby whenever a greenback was redeemed in specie it was to be re-issued, thus keeping up the amount in circulation. When the time arrived for redemption practically none were presented, and thus they were on a par with gold. They are still in circulation.

The Credit Mobilier.—This was a construction company which built most of the Union Pacific Railroad. The big stockholders controlled both companies, and were enabled to pay themselves enormous profits out of the construction. Congress was drawn into it when a number of the members accepted presents of stock in the Credit Mobilier, in return for which Congress was to give the company a free hand. A number of prominent politicians were found to be implicated, including Vice President Colfax, James A. Garfield, and James G. Blaine. They professed to be innocent of any corruption, but as Prof. Dunning says, "they saved their virtue at the sacrifice of their intelligence."

The Liberal Republicans.—The rotten conditions prevailing during Grant's administration brought about a cleavage in the Republican party, a group breaking away because they believed the party to be in the hands of corruptionists. The leaders of this movement were Horace Greeley and Carl Schurz. Their chief demand was civil service reform, concerning which Grant had expressed himself as being skeptical.

Grant Re-Elected.—The regular Republicans brought about Grant's re-nomination without difficulty, but there was a strong group, headed by Horace Greeley, editor of the New York Tribune, who attacked the Grant administration for its oppressive measures in relation to the South, and its corruption. These Liberal Republicans nominated Greeley for the Presidency, and the Democrats endorsed his nomination. Greeley's personality was against him, as he was too easily caricatured. The public conscience at the time was not sensitive to corruption, and the people still remembered that Grant had rendered great services to the Union. Grant was elected by a vote of 272 to 66. Greeley died shortly afterward.

The Salary Grab Act.—Congress was encouraged by the indifference of the people to the irregularities of Grant's administration, and so an act was passed increasing the pay of the President, the members of the Cabinet, Federal judges, and members of Congress. The increase was made to apply to the two years preceding 1873, and was called the "back pay steal." This was too much even for the tolerant American people, and the outcry that arose scared Congress into repealing the law at the next session so far as it applied to Congress, the inferior judges, and the members of the Cabinet.

The Whiskey Ring.—The government of the U. S. was being defrauded of its revenues from whiskey by a gang with headquarters in St. Louis. Grant's private secretary was involved, and Grant himself had accepted a valuable present from one of the ring-leaders. He went so far as to oppose the prosecution of the "ring," and removed a U. S. officer who tried to bring them to justice. The U. S. was defrauded of $3,000,000, and Grant can not be acquitted of all blame. He did not share directly in the loot, but he evinced no desire to punish the guilty.

The Belknap Affair.—Grant's Secretary of War, Belknap, had been selling government offices, and a committee of the House of Representatives recommended his impeachment. To save Belknap from this disgrace, Grant accepted his resignation.

Grant as President.—The eight years of Grant's administration constitute one of the most disgraceful periods in our history. Grant was elected to the presidency as a result of his war record. His term of office was marked by political intrigues and corrupt politics. The "Whiskey Ring" largely dominated the government during his administration.

As a soldier, Grant was far more outstanding than as a statesman. His two terms as president are marked by the absence of constructive measures.

THE ADMINISTRATION OF RUTHERFORD B. HAYES—1877–81.

The Election of Hayes.—Things were going badly for the Republicans. The corruption of the preceding eight years combined with hard times were a serious handicap, and now the Democrats were in control of the House of Representatives. Most of the Republican leaders had been involved in political scandals, so they finally chose as their candidate Rutherford B. Hayes of Ohio, against whom nothing was known. The Democrats nominated Samuel B. Tilden of New York, a reformer. The election turned upon the results in South Carolina, Florida, Louisiana, and Oregon, in all of which there were disputed returns. Both sides claimed the electoral votes of the first three states so the matter was thrown into Congress which passed a bill providing for an Electoral Commission consisting of five senators, five representatives, four justices of the Supreme Court, and a fifth justice to be chosen by the other four. As finally constituted, the Commission was composed of eight Republicans and seven Democrats. In all disputed cases the Commission divided on party lines, so Hayes was declared elected. Although it is probable that partisanship and not lack of votes defeated Tilden the Democrats behaved with commendable self restraint.

Hayes's Difficulties.—Hayes came into office with a dubious title, although no blame is attached to him. He was a man of scrupulous honesty, and because he would not play the game the way the Republican leaders wished they turned against him and made things uncomfortable for him. His kindly policy toward the South especially angered them. He brought military rule there to a final end, although he knew that his party was at an end in that section if he did so.

The Bland-Allison Silver Bill.—With a Congress divided and with his own party leaders bitterly opposed to him Hayes was able to do little. The only law of real importance passed was one providing that the Secretary of the Treasury should buy not less than $2,000,000 nor more than $4,000,000 worth of silver each month and coin it into silver dollars. This was pure inflation and the country lived to regret it; but the owners of silver mines and the debtor farmers of the west possessed enough influence to have the legislation they wanted passed. Hayes saw that the measure was unsound and vetoed it, but the Democrats wanted to secure votes in the west and, combined with the Republican inflationists, were able to pass the bill over the President's veto. A feature of the original bill, sponsored by Bland of Missouri, and providing for free coinage of silver was rejected.

An Estimate of Hayes.—President Hayes was a man with whom history has not dealt kindly. His enemies were able to get the ear of the public and he was too proud and too scrupulous to fight them with their own weapons. Under different circumstances he might have made a name for himself that would rank today with that of Washington and Lincoln. Woodrow Wilson said of him: "He was upright, public-spirited, inclined to serve the country unselfishly and in the interest of sound policy."

THE ADMINISTRATION OF JAMES A. GARFIELD AND CHESTER A. ARTHUR—1881–5.

The Election of Garfield.—Hayes was opposed in principle to a second term and refused to be a candidate in 1880. Grant's friends worked hard to secure the nomination for him and he would have been glad to get it, but James G. Blaine wanted it for himself, and he controlled enough votes to defeat Grant. The Republican Convention compromised on James A. Garfield of Ohio. The Democrats wanted Tilden to run but he refused, so they nominated General Hancock whose war record had been excellent. The only issue of prominence was the tariff, with the Republicans promising higher duties and the Democrats a reduction. Garfield's popular plurality was only 7018.

Party Quarrels.—Trouble arose when Garfield nominated Blaine for Secretary of State, Conkling, the New York "boss" being the leader of the faction opposed to Blaine. Garfield had his way in this and in other appointments so to show his disapproval Conkling resigned his seat in the U. S. Senate, expecting the New York legislature to re-elect him. It failed to do so.

Garfield Assassinated.—On July 2, 1881, while in a railroad station in Washington, Garfield was shot by a disappointed office-seeker. He lingered several months before finally succumbing.

Vice-President Arthur Becomes President.—Arthur's nomination for the Vice Presidency had been dictated by the "spoilsmen" of New York and his accession to the Presidency was considered a calamity by the friends of pure government. But to the surprise of everyone Arthur administered the duties of his office with unusual independence and ability, disregarding his former friends if it was to the interest of the public to do so.

Civil Service Reform.—For many years thoughtful people had denounced the spoils system that Jackson introduced, but no leaders had yet appeared who were able to get public opinion back of the plan to introduce the merit system. President Arthur urged it with all his might; the public was at last aroused to the necessity, and in 1883 Congress passed the Pendleton Act which provided for the appointment of a Civil Service Commission to examine candidates for certain public positions. The number of these positions was small at first, but the number was extended to include a majority of public offices.

High Tariff Continued.—Civil war duties were still being imposed, with the result that the government piled up a surplus each year. Arthur saw the necessity for tariff reduction and got Congress to appoint a committee to study the situation. It reported that the tariff should be reduced twenty per cent on an average. Congress, which had usually disregarded reports of special investigators, drew up a new tariff measure in 1883 which virtually left the tariff as it was, the slight reductions being more than counter-balanced by the increases. A powerful manufacturers lobby, by using all the legal and illegal means they could, were responsible for this iniquitous measure. It is interesting to note that William McKinley, later President, voted against the bill because the rates were too low. In 1884 hard times came, the surplus was reduced, and demand for tariff reform was not so insistent.

THE FIRST ADMINISTRATION OF GROVER CLEVELAND—1885–89.

The Election of Cleveland.—Blaine managed to overcome the opposition of the reformers in his party and was nominated for the Presidency. The Democrats chose as their candidate Grover Cleveland, the reform Governor of New York. Blaine's public career had not been free from irregularities, and one deal that he had made with the Union Pacific showed him up as a man who was not averse to taking favors from large corporations. A number of the leading reformers in the Republican party supported Cleveland who won the election by carrying his own state. Blaine's cause was injured by an injudicious speech made in his behalf by Rev. Burchard, who referred to the Democrats as the friends of "Rum, Romanism, and Rebellion." Enough New York Catholics took this seriously to vote for Cleveland. His popular plurality was only 23,000.

Civil Service.—The Democrats had been out of power for many years so their desire to take over the public positions filled by Republicans was natural. The Civil Service laws protected some, and Cleveland's own inclination was to leave in office all competent persons; but he had to yield somewhat, and about two-thirds of the unclassified offices were filled with Democrats. During the course of his administration Cleveland extended the Civil Service and set an example of watchfulness and self-restraint.

Presidential Succession.—By the law of succession to the Presidency, in case of the death, resignation, or removal of the President the office devolved upon the President pro tem of the Senate, and then upon the Speaker of the House. The death of Vice President Hendricks in 1885, occurring when there was no Congress, brought up the necessity for a new law; hence one was passed providing that the succession should pass to the Cabinet officers in the order of the establishment of their offices, beginning with the Secretary of State.

Regulation of the Railroads.—During the seventies and the eighties railroad building was at its height. To secure franchises and appropriations the railroad companies got into politics, and corruption was rife. Competition among themselves was giving way to agreements, and the public was being gouged. The western farmers especially were discriminated against. After much agitation Congress passed the Interstate Commerce Act of 1887, the main provisions of which were as follows: A Commission of five was to be appointed by the President to supervise the actions of the railroads so far as the public interest was affected; rates were to be reasonable, and were to be printed; more could not be charged for a short than a long haul.

The Tariff Issue.—A group of high-tariff Democrats united with the Republicans to prevent revision of the tariff. In his message of December, 1887, Cleveland denounced the tariff as productive of high prices and over-speculation. The surplus had been piling up for several years and there was no good use to which it could be put. The House of Representatives passed the Mills Bill, but it was rejected by the Senate.

THE ADMINISTRATION OF BENJAMIN HARRISON—1889-93.

The Election of Harrison.—The Democrats nominated Cleveland without so much as taking a ballot. The Republicans nominated Benjamin Harrison of Indiana, rejecting a much stronger man, John Sherman of Ohio. The issue of the campaign was the tariff, and the manufacturing interests contributed large sums of money to defeat Cleveland whom they accused of being a free-trader. Cleveland denied this, but the people of the country seemed to think that a reduction of the tariff meant the loss of prosperity, so Harrison was elected by 233 electoral votes to 168, although Cleveland got more popular votes than Harrison.

The Spoils System.—Harrison was a believer in Civil Service but the urge of office seekers was too much for him. He managed to protect the Civil Service rules from serious inroads but almost every Democrat in the unclassified service was removed. 30,000 Democrats lost their positions the first year. Harrison allowed the bosses of Pennsylvania and New York, Matthew S. Quay and Thomas Platt, to dictate removals and appointments, and he himself took good care of his relatives and friends.

Foreign Affairs.—Blaine, Secretary of State, pursued an aggressive foreign policy, and several times the U. S. was seriously involved in controversies with other countries. The question of what country owned Samoa was settled by a conference of Germany, Great Britain, and the U. S., but not until bad feeling between Germany and the U. S. had resulted. Another bothersome issue was that of the Alaska seal-fisheries. British and Canadian seal fishermen had been killing seals in the open sea off Alaska, and the U. S. made the claim that the whole of the Bering Sea belonged to the U. S. After many irritating incidents the matter was left to a board of arbitration which decided against the U. S. on almost every point.

Pension Legislation.—In 1890 a Pension Law was passed giving all veterans of the Civil War, Union, of course, a pension of not more than twelve dollars a month, and the act applied to widows, dependents, and children of the veterans. In 1893 the number of pensioners amounted to 1,000,000, and the money paid annually to $157,000,000. The surplus was thus easily disposed of.

The McKinley Tariff Bill.—By this law, passed in 1890, duties on articles of common use were raised, including agricultural products. The duty on sugar was reduced but a bounty to domestic sugar raisers was granted which cost the government about $10,000,000 a year. Duties under the McKinley bill averaged fifty per cent, and the cost of living rose proportionately.

The Sherman Anti-Trust Act.—High tariffs had bred trusts and other forms of business combinations, and the public was in the grip of these selfish interests. The agitation to exercise some control over them had been growing until Congress could not afford to disregard it. So the Sherman Act was passed making illegal "every contract, combination in the form of trust or otherwise, or conspiracy in restraint of trade." Prosecutions were rare, and convictions rarer.

THE SECOND ADMINISTRATION OF GROVER CLEVELAND—1893–97.

The Election of Cleveland.—Harrison was renominated with little opposition. He was not in the least a popular man and had been an undistinguished President, but he controlled the party machinery. The Democrats again chose Cleveland. The parties took their old stand on the tariff, but Cleveland let it be known that manufacturing interests were safe from him. A third party, the Populist, nominated a candidate on the platform of free silver. The Republicans suffered from the fact that hard times were upon the country and labor disturbances were frequent. Cleveland was elected by 277 electoral votes to 145 for Harrison. The Populists carried four states in the west.

Financial Troubles.—The McKinley Act had decreased the revenues from imports. Paper money redeemable in gold amounted to $500,000,000 and the U. S. Treasury's gold reserve amounted to only $100,000,000. As fast as the legal-tender notes were redeemed they were reissued and paid out, only to come back soon for redemption. Cleveland persuaded Congress to repeal an act of 1890 which instructed the Secretary of the Treasury to buy silver. This was unavailing, and the gold reserve dropped lower until the U. S. was facing virtual bankruptcy. Cleveland had to suffer for the sins of the preceding administration. To remedy the situation he bought gold from New York bankers, and then sold U. S. bonds to the public. The silver people used this as an illustration of what occurred under the single monetary standard.

The Panic of 1893.—The causes of this disturbance were varied, but probably the most important cause was the expectation that the U. S. would abandon the gold standard. The Republicans have always claimed that it was due to the Wilson Tariff Law, but since hard times were upon the country before this Law was passed it could have had little to do with it. The depression was severe, and the resultant evils great. Strikes were common, that of the employees of the Pullman Company being the worst. During this strike a judge of the U. S. District Court ruled that the violation of an injunction was contempt of court and could be punished by the judge without trial by jury. The labor unions have never ceased to combat this.

Foreign Questions.—The matter of annexing Hawaii had long been thought of and it had been a virtual protectorate of the U. S. for years. An American had overthrown the old government, and Cleveland had a report made. On the basis of that report Cleveland ordered the American to give up the throne, which he refused to do. The U. S. Senate evidently supported the usurper, for it would not support Cleveland in his attempt to restore the legitimate ruler of Hawaii. In 1898 Hawaii was annexed to the U. S. The Venezuela dispute was a serious one indeed. The boundary between Venezuela and British Guiana had long been disputed, and by 1895 the British were evidently going to encroach upon Venezuela's territory. Cleveland objected in the strongest terms he could find to this violation of the Monroe Doctrine, but fortunately for the world the British government was not equally belligerent, and the dispute was settled by arbitration.

THE ADMINISTRATION OF WILLIAM McKINLEY—1897–1901.

The Election of McKinley.—Cleveland left his party in a demoralized condition, the "gold" and "silver" Democrats being hopelessly split. The latter secured the nomination of William J. Bryan after a bitter fight, but at the cost of losing the support of the "gold" Democrats who nominated a separate candidate. The Republicans took Mark Hanna's man, William McKinley of Ohio, a friend of high tariff. Bryan's brilliant oratory was not sufficient to win for him, and McKinley won the election with 271 electoral votes to Bryan's 176.

The Dingley Tariff Act.—McKinley urged tariff revision, and Congress rushed through a bill which raised duties to the peak. Raw materials were restored to the dutiable list. The Dingley Act was denounced by the Democrats as a betrayal of the interests of the people, and the Republicans praised it as the source of the prosperity of the country.

The Spanish-American War.—Cuba had more than once caused trouble between the U. S. and Spain, our people always sympathizing with the Cubans in their attempts to be free. A revolution which broke out in 1895 brought forth severe retaliation from the Spanish Governor and caused much indignation in the U. S. McKinley protested, and Spain promised the Cubans self-government, but the Cubans would be satisfied with nothing short of independence. The U. S. battleship Maine, anchored in Havana harbor, was blown up February 15, 1898, and investigation seemed to prove that it had been caused by a mine. McKinley reluctantly sent a message to Congress urging intervention, and in April Spain declared war on the U. S. Spain was in no condition to fight, and in a few months declared her readiness to make peace. By the terms of the treaty Spain gave up Cuba, the Philippines, Puerto Rico, and other islands, all but Cuba being ceded to the U. S., which paid Spain $20,000,000 for the Philippines.

The Open Door in China.—This was a period of world imperialism, and all the great powers were looking for new lands to conquer or "protect." China offered a fair field for exploitation, and several European nations had marked out fields for themselves there. To prevent the shutting out of U. S. commerce Secretary of State John Hay announced what has since been known as the "open door" policy in China, asserting that the interests of the U. S. could not be disregarded. Great Britain acceded, but the other nations would not. Nevertheless, this pronouncement did much both for China and the U. S.

The Gold-Standard Act.—In 1900 exports exceeded imports by over $500,000,000, and gold was pouring into the country. In March, 1900, Congress passed the Gold-Standard Act which declared the gold dollar to be the standard unit of value and provided that all legal-tender notes were to be redeemed in gold the reserve of which was to be increased to $150,000,000. Bi-metallism now became a dead issue. Another part of this law amended the National Banking Act to permit the establishment of national banks in places of 3,000 inhabitants or less, with capital of $25,000.

THE ADMINISTRATION OF McKINLEY AND THEODORE ROOSEVELT—1901–5.

McKinley Re-Elected.—The unprecedented prosperity of the McKinley administration assured his re-nomination, which took place on the first ballot. Bryan again received the Democratic nomination. The Republicans played up the "full dinner-pail" idea and gave their party the sole credit for prosperity, while the Democrats, saying less than they had the preceding campaign about free silver, made imperialism the chief issue. The people were not interested in this and the issue fell flat. McKinley received 292 electoral votes to Bryan's 155.

McKinley Assassinated.—On Sept. 5, 1901, while in the city of Buffalo, N. Y., visiting the Pan-American exposition President McKinley was shot and killed by an anarchist. McKinley had many of the qualities that make for popularity and his death was mourned by everyone.

Law against Threatening the President.—So great was the public revulsion when a third president was shot within a generation in the United States that steps were taken almost at once to secure the passage of a special act dealing with those who threaten or attempt the life of the President. The federal law quoted below makes it a crime even to threaten to harm or kill our chief executive.

Chapter 64—U. S. Statutes—An act to punish persons who make threats against the President of the United States.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that any person who knowingly or wilfully deposits or causes to be deposited for conveyance in the mail or for delivery from any post office or by any letter carrier, paper, writing, printing, or document containing any threat to take the life of, to inflict bodily harm upon the President of the United States, or who knowingly or wilfully otherwise makes any such threat against the President, shall upon conviction be fined not exceeding $1,000 or imprisoned not exceeding five years, or both.

Roosevelt Becomes President.—Roosevelt had taken a spectacular part in the Spanish war and had been known in a small way as a reformer. He kept McKinley's Cabinet and announced his intention of continuing McKinley's policies.

The Trusts.—Republican policy had fostered the gigantic combinations known as trusts. Many of the commonest articles of consumption were controlled by these corporations, and competition scarcely existed. The Sherman Act was a dead letter, not one trust being prosecuted under the McKinley administration. The public was being mulcted by these monopolies.

Roosevelt Attacks the Trusts.—Roosevelt made a distinction between good and bad trusts; the latter must go, he said. With his ability to dramatize a situation he aroused the people to the dangers from these organizations, but Congress remained unmoved. Roosevelt then resorted to the Sherman Act, and by his direction the U. S. Attorney General began the prosecution of some of the more notorious trusts. The government won a number of these suits but the result so far as the public interest was concerned was little. Roosevelt won great popularity, not with "big business," of course, but with the general public.

The Coal Strike.—In the early part of 1902 there was a strike in the anthracite coal mines of Pennsylvania. The whole country was affected and Roosevelt took a hand. The operators tried to maintain that the affair was one wholly between the miners and the operators, but public opinion forced them to agree to arbitration, and the strike was thus settled.

The Panama Canal.—The question of a canal in Central America to connect the Atlantic and the Pacific was a very old one. The attempt of the builder of the Suez Canal, de Lesseps, had failed. Roosevelt set about accomplishing it. In 1901 the Hay-Pauncefote agreement between the U. S. and Great Britain recognized the right of the U. S. to build a canal, the only restriction being that all vessels must be "on terms of entire equality." Colombia owned Panama and provoked the U. S. by its unstable policy and double dealings. The people of Panama, in 1903, rebelled against Colombia, and U. S. war-vessels prevented the Colombian government from suppressing the insurrection, so it was successful. A treaty was signed with the new Republic of Panama by which the U. S. purchased a zone for the building of the canal. Roosevelt never made any apologies for his part in the Panama affair—to the contrary, he was proud of it.

The Open Door in China.—The annexation of the Philippines brought the United States into contact with the politics of the far East at a time that European powers were engaged in the economic exploitation of that part of the world. China, especially, was being absorbed by the great European states; Great Britain had taken Hong Kong, France was established in southwestern China, and Germany occupied the Shantung Peninsula. The United States was building up a large trade with the Chinese and this was endangered by the aggressive attitude of the European powers. John Hay, the United States Secretary of State, addressed a note to these states requesting that each would agree, in effect, not to interfere in the trade of China with countries which did not possess a foothold in China. Although no formal assent to Hay's "open door policy" was ever given, the states to which the note was addressed understood its import and respected our rights.

THE ADMINISTRATION OF THEODORE ROOSEVELT—1905–9.

Roosevelt Elected.—The Republican leaders were rather doubtful about Roosevelt, but they could not resist popular demand, so he was nominated. The conservatives were now in control of the Democratic party and nominated Alton B. Parker of New York. Free silver dropped out altogether as an issue, as did imperialism. Both parties were lacking issues, so the popular candidate won with an electoral vote of 321 to 162.

The Hepburn Act.—The railroads had for years been discriminating against certain shippers and communities, giving better rates to their favorites, especially to the concerns in which they had an interest. The evils were very great, and the western farmers especially were hurt. The Elkins Act of 1903 forbade rebates, but little attempt was made to enforce it. In 1906 Congress passed the Hepburn Act giving to the Interstate Commerce Commission the power of fixing rates.

Pure Food Laws.—The public had been at the mercy of manufacturers of food products. Spoiled meats, adulterated medicines, poisonous patent-medicines, had been sold for years with no effort on the part of the states to stop it. To Roosevelt's lasting credit he forced through a reluctant Congress a law with the following provisions: All meat shipped in inter-state commerce had to be from healthy animals; it had to be inspected by government officials; and it had to be prepared under sanitary conditions. Although evaded sometimes, these laws were productive of great good.

Conservation.—Roosevelt was an "out-of-doors" man, and hence interested in the preservation of natural resources, forests especially. Acting under authority of a law passed in 1891 he withdrew nearly 150,000,000 acres of public land to be used as a forest reserve. Through his initiative the U. S. and the states set about the irrigation of the desert lands and in a short time many millions of acres had been reclaimed.

Campaign Funds.—In 1905 it was discovered that the great corporations had been contributing large sums of money to campaign funds, and even had prominent senators on their payroll. To break up the first practice a law was passed prohibiting corporations from making any contributions to campaign funds. Experience has since determined that the law was futile, for no method can be devised that will keep the prominent officials of corporations from making such donations as they please.

Roosevelt as President.—Not much in the way of constructive legislation was accomplished during the seven years that Roosevelt was President, but public interest in important questions was stimulated to heights it had not reached since the early days of the republic. For this Roosevelt deserves the credit. Wall Street found that his bark was worse than his bite, and as time went on the great bankers and corporation officials ceased to fear him. Roosevelt was a nationalist above all, and he believed that the rights of the states ought to be subordinated to the interest of the entire people of the U. S.

THE ADMINISTRATION OF WILLIAM HOWARD TAFT—1909–13.

The Election of Taft.—Roosevelt refused to be a candidate in 1908, although strictly speaking he had been elected but one term. He was strong enough to name his successor, Secretary of War Taft, a former judge and Governor-General of the Philippines. The Democrats returned to Bryan as their best chance, and not only nominated him but allowed him to write the platform, which contained some constructive suggestions for the control of monopolies. Taft won with 321 electoral votes to 162 for Bryan.

The Payne-Aldrich Tariff Bill.—Taft called a special session of Congress almost as soon as he became President, the purpose being tariff revision. The House bill was not high enough to suit Senator Aldrich, now the boss of the Senate, and when the bill was finally passed it was far more of a Senate than a House measure.

Progressivism.—By this time there was a rift in the Republican party. It finally began to dawn upon the middle west especially that the interest of that section was not well taken care of by the corporation lawyers who controlled Congress and Cabinet. High tariff was profitable for the manufacturers, but less so for the farmers.

The Ballinger-Pinchot Controversy.—Upon his retirement Roosevelt withdrew more land for reserves, with the idea of keeping water-power sites out of the hands of private corporations. Taft's Secretary of the Interior, Richard Ballinger, rescinded this order, and the U. S. Chief-Forester, Gifford Pinchot, attacked the action of his superior officer as one designed to turn over the valuable reserves of the U. S. to water-power corporations. Pinchot was dismissed, but the affair did not end until Roosevelt and Taft were estranged, Taft supporting Ballinger.

Progressive Legislation.—Taft, while not a progressive, was not a reactionary either, and he supported a good deal of advanced legislation. In 1910 a postal savings-bank system was set up. The same year a Bureau of Mines was established for the purpose of aiding the states in the prevention of accidents. Another act required the names of all persons contributing to campaign funds to be published along with the amounts subscribed. The most important law was the Mann-Elkins Act which gave the Interstate Commerce Commission power to make investigations on its own initiative and change rates. The most important part of the original bill was struck out by the Senate, that requiring the consent of the Commission before stock or bond issues could be sold by common carriers. Two amendments to the U. S. Constitution were passed by Congress and ratified by the states during Taft's administration, the 16th permitting Congress to levy an income tax, the 17th providing for the election of Senators by the direct vote of the people.

Trust Prosecution.—Public opinion forced Taft to proceed with the prosecution of the great trusts, and the government won several decisions, notably in the cases of the American Tobacco Co. and the Standard Oil Co., both of whom were declared to be combinations in restraint of trade. Their dissolution was ordered, but the companies were not adversely affected.

THE ADMINISTRATION OF WOODROW WILSON—1913–21.

The Election of Wilson.—The break between Roosevelt and Taft became complete after the former returned from his African trip. Taft displayed an independence that Roosevelt did not like, and to defeat him went after the nomination himself in 1913. Republican leaders much preferred Taft, and they controlled the nominating convention. That Roosevelt was the choice of the rank and file of the party is probably true, but Taft got the nomination. The Roosevelt men seceded and formed a Progressive party, naming Roosevelt as their nominee. The Democrats had the choice of several prominent men, notably Bryan, Champ Clark, and Oscar Underwood. When Bryan saw that he could not be nominated he threw his strength to the man who seemed to be the most progressive, Woodrow Wilson, Governor of New Jersey, and former President of Princeton University. Wilson won the election by virtue of the split in the Republican party. Wilson's electoral vote was 435, Roosevelt's, 88, and Taft's, 8.

A New Kind of Statesman.—Wilson was a genuinely new kind of President. All but two years of his mature life had been spent in scholarly pursuits, and his knowledge of politics was theoretical rather than practical. As governor of New Jersey he had sponsored many progressive laws, and this attracted Bryan to him. To many, a "scholar in politics" was a man out of place; but Wilson was destined to accomplish more constructive legislation than any President we have ever had. He was fortunate in that his party controlled both houses of Congress at first.

The Underwood Tariff Bill.—Wilson called a special session of Congress to consider the tariff, and for the first time since 1801 a President read his message to Congress in person. The Underwood Bill reduced the tariff on 1,000 articles and made it necessary to levy an income tax to make up the expected deficit. This act was denounced by the Republicans as a blow at business, but manufacturing interests did not suffer apparently.

The Federal Reserve Act.—A better Federal banking system had been talked of for many years, but the Republicans did not push it, and allowed a Democrat to get the credit for it. The Owen-Glass Federal Reserve Act of 1913 contained the following provisions: Twelve Federal Reserve banks were set up in as many cities, and the national banks of the region were to be member banks, with the addition of as many state banks as would come in; currency could be issued by these Reserve banks on the commercial paper of the member banks; the whole system was to be under the direction of the Federal Reserve Board, composed of 6 members appointed by the President. Few legislative acts in our history have had so beneficent an effect upon the country.

The Clayton Act.—Wilson now turned his attention to the trusts, with the result that a Congress wholly under his control passed the Clayton Anti-Trust Law of 1914 forbidding the discrimination in price between purchasers where

the effect is to stifle competition; it forbade inter-locking directorates and the purchase of stock by a corporation of another corporation where competition was lessened; it exempted labor unions and farmers organizations from the provisions of the Act. The last provision was declared void by the Supreme Court so far as it exempts labor unions. The Clayton was a serious attempt to put teeth in the Sherman Act.

Latin-American Troubles.—In 1914 the U. S. made a treaty with Nicaragua whereby we acquired the right to build a canal in Nicaraguan territory and to supervise fiscal affairs. In 1916 we assumed a similar protectorate over Haiti. Both of these treaties were destined to disturb our relations with other states of Latin America which feared "Yankee" imperialism. The Mexican situation was bad when Wilson became President, due to the murder of Madero and the accession of Huerta. Wilson would not recognize Huerta, especially as Mexico was in a state of anarchy and lives and property of Americans were in danger. In spite of many provocations Wilson refused to intervene, proclaiming his policy to be that of "watchful waiting." In 1915 Huerta was overthrown by Carranza who sometime later was recognized by the U. S. government. But Mexico remained a thorn in the side of this country.

The Great War Breaks Out.—After 1914 foreign affairs engaged the attention of the U. S. almost to the exclusion of domestic matters. At the outbreak of the Great War President Wilson issued a proclamation of neutrality, but it was a difficult thing to live up to because of the fact that millions of Germans, Slavs, Irish, English, etc. were living here, and most of them supported the mother country enthusiastically.

German Plots.—Another source of difficulty was the plots set on foot by Germans mainly, having for their purpose the destruction of plants engaged in making supplies for the Allies. Our government was compelled to be on its guard constantly against such acts.

Dispute with England.—When U. S. vessels attempted to carry goods to Germany they were stopped by British ships sent out to enforce the blockade. Wilson protested against this as an unwarranted extension of international law, but in the end was forced to give in.

Wilson Re-Elected.—The Republicans took their nominee from the Supreme Court, Chas. E. Hughes, and he got the support of Roosevelt who did not like Wilson's policy. Wilson was re-nominated by the Democrats, and won the election by 274 electoral votes to 257 for Hughes.

The U. S. Joins the Allies.—The sinking of the Lusitania with the loss of more than 100 Americans almost got us into the war in 1916; but Wilson was averse to fighting if it could be avoided. But Germany disregarded her promises to spare American vessels and at last Wilson's patience was exhausted, and on April 5 Congress declared war on Germany.

Raising an Army.—No time was lost in assembling a military force, and a Conscription Act was passed to provide an adequate army. By the time the war ended the U. S. army numbered more than 4,000,000 men, and the whole force had been raised with a minimum of objection, in contrast with the conscription riots of the Civil war.

Food and Fuel.—To assure an adequate supply of food for the army as well as civilians the U. S. government put the regulation of the sale of food in the hands of a Food Administration under Herbert Hoover. Hoarding was forbidden, prices regulated somewhat, and the farmers were given every encouragement to increase the crops. A Fuel Administrator was appointed to conserve the supply of coal especially. Both these organizations functioned efficiently, in contrast with the Aircraft Board whose administration was a disgrace.

Wilson as War Leader.—After we were once in the war Wilson became an inspiring leader. His addresses were master-pieces of eloquence and did much to unite the American people. Some Republicans were disposed to be jealous of him but in the main he was supported by all persons regardless of party.

Our Part in Winning the War.—The U. S. troops arrived in France at a most critical time for the Allies. Whether or not we actually won the war we at least prevented Germany from winning it. Our losses were not great, considering the magnitude of the conflict, and on the whole the money appropriated was well spent.

The Armistice.—In October, 1918, the Germans realized that they were beaten, and so asked for an armistice on the basis set forth by Wilson some time before, the "Fourteen Points." These had stipulated for the freedom of the subject races of Europe, freedom of the seas, etc., all of which seemed mild to the Germans now. The Armistice was granted on terms laid down by General Foch, the French Commander-in-Chief. The Germans were in no position to refuse, although they protested that they had been tricked.

The Treaty of Versailles.—To make a permanent settlement of European affairs the nations engaged in the war sent representatives to Paris, and Wilson chose to go himself. For this he has been much criticized, but it remains for future historians to appraise this act. He was unable to embody all the liberal provisions that he desired in the Treaty, but it is safe to say that had he not been there even worse terms would have been imposed.

The U. S. Senate Rejects the Treaty.—Senator Lodge, the Republican leader of the Senate, was the bitter personal enemy of Wilson's, and when the latter brought back the Treaty of Versailles containing a provision for a League of Nations the Senate supported Lodge's contention that the U. S. ought not to take part in European affairs to such an extent as would be necessary under the League. Wilson used his waning strength to convert the people of the U. S. to his views, but his health broke down and during the last year of his administration was unable to carry on the duties of his office. He died in February, 1924.

CALVIN COOLIDGE 1923-29

THE ADMINISTRATIONS OF WARREN G. HARDING AND CALVIN COOLIDGE—1921-29

The Election of Harding.—The leader of the Republican party was Senator Penrose of Pennsylvania, but, like Mark Hanna and other bosses, he was too well known to secure the nomination. He did secure the selection of a man of the McKinley type, Senator Harding of Ohio, and naturally was the power behind the throne. Progressive sentiment was ignored. The Democrats could have taken Wilson's son-in-law, W. G. McAdoo, who had displayed remarkable administrative ability during the war and who was popular with the laboring people, but McAdoo had made many enemies. Their choice was Governor James M. Cox of Ohio who had made a good record in that state. The issue of the campaign was the League of Nations and the people apparently repudiated it by electing Mr. Harding by a huge majority, 404 electoral votes to 127.

The Budget System Established.—Wilson had vetoed a Budget Bill because it took away from the President powers that he thought the President should have. Harding was not so sensitive as to his prerogatives and gladly signed a bill establishing a budget system. There was to be a Director whose duty it was to prepare a budget and submit it to the President who passed it on the Congress. Differing from the English system there was nothing to prevent Congress from raising the estimates, and this proved to be the vital weakness of the system.

The Washington Conference.—Since the U. S. had rejected the League of Nations, Harding, a well-meaning man, thought that we might contribute to world peace in a practical way by having a conference of the great powers meet in Washington for the purpose of considering disarmament. In November, 1921, this conference met and came to an agreement affecting naval establishments. The U. S. and Great Britain were to be on equal terms, Japan could have a navy about three-fifths as large as the two Anglo-Saxon states, and France and Italy were limited still more.

Harding Dies.—While on a trip through the far west in the summer of 1923 President Harding was taken ill and died unexpectedly. Like McKinley he was a very popular man and the people of the country were shocked by his death. He had not been President long enough to accomplish much, but there were indications that if he had lived out his term he would have asserted his leadership.

Coolidge Becomes President.—Calvin Coolidge had been obscure until the newspapers had played him up as the strong man who had settled the policemen of Boston when they went on a strike. This occurred when he was Governor of Massachusetts, and was the best kind of publicity. He now stepped from the obscurity of the Vice Presidency to the glare of the Presidency, but, being of phlegmatic disposition, his new duties did not outwardly disturb him. He retained all of Harding's Cabinet and announced his intention of carrying on Harding's policies.

Congressional Investigations.—The 68th Congress spent much of its time investigating charges of corruption that were brought against public officials. Affairs in the Bureau of War Risk Insurance were shown to be rotten in the extreme, and criminal charges were made against the Director, Colonel Forbes. The reason why the expenditure of hundreds of millions of dollars for aircraft during the war failed to produce results was looked into. Most important of all was the charge of corruption brought by Senator Walsh of Montana against certain Cabinet officers that they had given away valuable oil lands belonging to the government. Specifically, Secretary of the Interior Fall was accused of illegally leasing The Teapot Dome oil field to a company headed by Harry Sinclair, and California reserves to Edward L. Doheny. The leases were made secretly and Secretary Fall was alleged to have received a large sum of money from Sinclair and Doheny. Fall resigned, and Secretary of the Navy Denby, who had transferred the control of the oil lands from his department to the Interior Department, also resigned. Suits were brought by the government to set aside the leases, but the lower court held them to have "been made in accordance with the law."

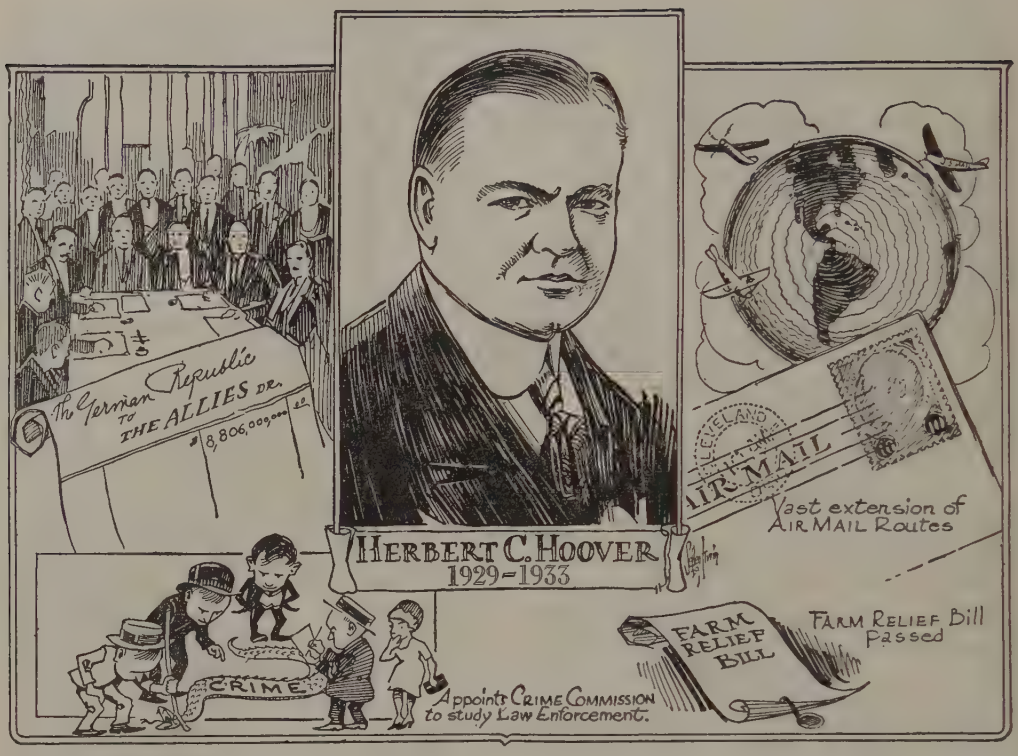
The Campaign of 1924.—There was no question that President Coolidge would be nominated by the Republican party, and this was done unanimously by the Cleveland Convention. A group of Progressives, led by Senator LaFollette, broke away from the old parties, and nominated LaFollette and Senator Wheeler of Montana, who had taken a prominent part in the investigation of the oil scandals. The two most prominent candidates for the Democratic nomination were Governor Alfred Smith of New York, and William McAdoo, former U. S. Secretary of the Treasury. The New York convention balloted for nearly two weeks, and finally nominated John W. Davis of West Virginia, who had served as Ambassador to Great Britain. Coolidge polled nearly as many votes as his opponents combined, and won easily.

The Foreign Debt Question.—During the Great War and the period immediately following the U. S. had loaned its Allies nearly eleven billion dollars. England, whose loans abroad were larger than the U. S., offered to cancel the debts owed her if the U. S. would do likewise. Arguments favoring this were: The war had been fought in a common cause and the U. S. had not borne her share. The U. S. emerged from the war by far the richest state in the world. The interest the U. S. would receive from year to year would upset still more the balance of trade, and would impoverish Europe for years, at the same time injuring the U. S. by hampering the buying capacity of Europe. The U. S. Government replied: The other Allied states had taken their recompense in territories formerly belonging to the Central Powers. The U. S. had little at stake compared with the other Allies. To cancel debts contracted in good faith was a bad precedent, which might hamper future borrowing. The U. S. taxpayers should not be called upon to assume European debts. If the states of continental Europe would go on a peace basis (cutting down their expenditures for military purposes) they could balance their budgets and pay their debts. Secretary Mellon and Chancellor of the Exchequer Baldwin came to an agreement regarding the British debt whereby sixty-two annual payments were to be made, interest to range from three to three and one-half per cent. Baldwin's successor, Winston Churchill, condemned the agreement, and a controversy between him and Mellon ensued, disturbing somewhat the good feeling between England and the U. S. The chief point at issue had to do with the time the money was loaned, and the use made of it, Mellon stating that the U. S. had practically canceled the debts contracted during the war and was only demanding the payment of its post-war loans. Mellon announced that all of the U. S. debtors with the exception of Russia had signed agreements to pay the U. S. The terms were based on their respective capacity to pay, the severest terms being imposed upon Great Britain and the most lenient upon Belgium.

The World Court.—President Coolidge made a mild effort to have the U. S. enter the World Court, and the Senate passed a resolution authorizing our entry but with stringent reservations which would give us the position of the most favored state. Senator Borah, the leader of the "Irreconcilables," fought against the adhesion of the U. S. to the Court on any terms, and in the end he won because the World Court states would not accept all the U. S. reservations. Coolidge made a statement to the effect that if the great world powers did not agree to a reduction of armament the U. S. would embark on a naval-building program calculated to be the greatest ever undertaken by any nation.

Tax-Reduction.—The prosperity of the U. S. was so great that the amount of Federal taxes collected exceeded all official expectations. The surplus could be used to pay off the U. S. domestic debt, or it could be returned to the tax-payers as a rebate. The income and corporation taxes had been greatly lowered for the year 1926 and Secretary Mellon opposed any further cut, stating that the government had better be on the safe side. But by the close of the year the surplus had piled up to such an extent that President Coolidge on his own initiative declared that tax-payers should be given a rebate on their 1926 taxes. Mr. Coolidge vetoed some bills calling for increased expenditures, but Congress enacted several of them over his protest. He also vetoed the McNary-Haguen bill designed to promote farm relief.

Refuses to Run.—Many supposed Mr. Coolidge intended to try for another term in 1928. In the summer of 1927, however, he sought to quiet all such rumors by making his famous pronouncement, "I do not choose to run again." In August, 1928, the United States became a party to the Treaty of Paris, by which fifty-five nations agreed to outlaw war. Mr. Coolidge followed this with a clear exposition of U. S. policy on Armistice Day, reenforced in magazine articles after his retirement in March, 1929.



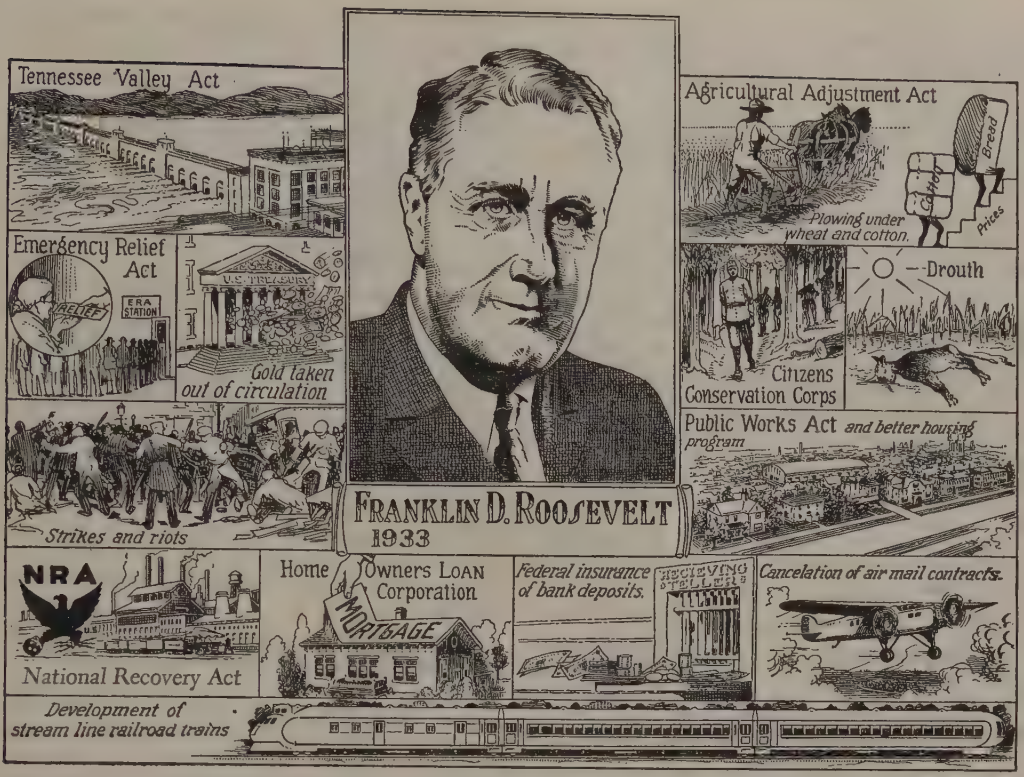
THE ADMINISTRATION OF HERBERT HOOVER
1929–1933

Election of 1928. Hoover defeated Alfred E. Smith by an electoral vote of 444 to 87, largest to that time; he carried 44 states, including Virginia, North Carolina, Florida, and Texas of the "solid South." In his eight campaign speeches, he stressed farm relief, flood prevention, hydro-electric development, and government economy.

Early Legislation. A special session of Congress set up a plan to help the farmer, but it proved ineffective, and also passed a tariff raising rates about 20%, after 1253 differences in schedules as between the Senate and House were adjusted. Hoover signed the compromise because it gave him permission to change certain rates as need arose. A commission of 11 authorities in law, chosen to study the "entire question of law enforcement" recommended change in the Prohibition law and in enforcement of all laws to prevent crime. Enforcement stiffened as a result of this report. Income taxes were reduced because of a treasury surplus of 160 millions. By a reapportionment, the House of Representatives lost members in 11 states and gained in 21. The Kellogg-Briand Treaty renouncing war was ratified, and President Hoover tried to delay building of battleships already ordered. He sought in vain to unify government bureaus and to promote economy.

The Depression. Borrowing by individuals rose to over 200 billions, securities reached new peaks, but farm prices went down and down, and foreign nations failed to pay us and to trade with us. On October 29, 1929, the stock market crashed to new low levels, while 16 billion shares were sacrificed at an untold loss to holders. To remedy these conditions, Hoover secured a debt moratorium among foreign nations to save Germany from complete collapse, and to stimulate international trade. The gold standard was abandoned, however, by most nations, payments on debts ceased, confidence declined, and eventually over 10 million men were out of work in the United States. The Federal Farm Board, created to stabilize prices, proved a failure. Banks and other corporations that otherwise would have failed were helped, however, by loans from the Reconstruction Finance Corporation, organized early in 1932. Yet a publicity feature written into it by a hostile Congress caused further distress and lack of faith. World War veterans demanded payment of the "bonus" due in 1942, and thousands of men marched to Washington, only to be dispersed by the military and police.

Other Legislation. The banking laws were amended, the Farm Credit Banks were favored, the short or "Lame Duck" session of Congress was abolished by amendment to the Constitution, the Norris anti-injunction law was passed, and the United States refused longer to aid in collection of debts owed our citizens in foreign lands.



Emergency Legislation.—The banking crisis reached its height between election time and Roosevelt's taking of office. Fear of devaluation, hoarding, and sending of money out of the U. S. resulted in many states proclaiming bank holidays. March 5, Roosevelt summoned Congress to meet on March 9, and proclaimed a national bank holiday until March 13.

The country being in panic condition, business at a stand-still, Congress completely Democratic, with the nation solidly behind the President, there quickly followed a large number of measures, beginning with an Act of Congress that transferred to the President, almost absolute control over credit, currency, gold, silver, and foreign exchange. Penalties were provided for hoarding gold, and nearly a billion came back into circulation by March 27, the last day allowed without a penalty. The final date was however extended. He received a wave of popular approval on his Economy Act when he entered office by cutting salaries and reducing the soldiers' pensions. These salaries and pensions were restored however within a year.

One of the earliest acts of the Administration was the legalization of 3.2 beer, followed by the repeal of the 18th Amendment and the return of hard liquor. The cheapness of farm products, prices being the lowest in 34 years, resulted in the creation of the AAA, Agricultural Adjustment Administration, with power to impose processing taxes and subsidize the farmer for not growing cotton and cereals, for killing hogs, in an effort to raise the price level to 1926 prices; the Unemployment Relief Act, granting money to people out of work; the CWA Act, which became known as the "Leaf Raking Act"; the CCC, Civilian Conservation Corps, providing jobs for 300,000 boys and young men to work in the forests on conservation projects; the Tennessee Valley Authority to develop water power projects on a gigantic scale. This was also to be used as a social project in the Tennessee valley. A treaty of recognition was made with Russia with the hope of stimulating business.

The National Recovery Act (Blue Eagle), provided three and a quarter billions for expense and relief to be used prior to June 16, 1935, when it was to expire. Under this Act, there sprang up many bureaus; such as, "Subsistence Homesteads," removing people from centers of unemployment, and establishing them in government-built homes on one or more acres of ground; the Commerce Credit Corporation, to buy, sell, and deal in agricultural commodities; Federal Bank Guarantee Act, guaranteeing deposits in banks up to $5,000; the HOLC or Home Owners' Loan Corporation, to provide home loans, relieve debts; the SEC or Securities Exchange Act, governing all transactions on the New York Stock Exchange. The President was given the power to stabilize the currency with the gold profit. Congress adopted a navy replacement program calling for the expenditures of 500 millions.

Monetary Policies.—Two schools existed on the gold policies of the United States. One group insisted on maintaining a solid gold basis, another

insisted on devaluation. Roosevelt finally called in all gold coins and certificates, reduced the content to 59 cents for a dollar, and raised the price from $20.66 to nearly $34 an ounce. On the transaction, the treasury took a profit of $2,800,000,000. Later silver was fixed at $1.29 an ounce, but a free ounce had to be given by the owner for coinage costs.

Early Results.—Subjects considered were agriculture, banking, relief, sale of securities, unemployment, electric power, mortgage relief, better housing, railroads and industrial profits. (See pages 1138–1148.) By 1934 over 30 "alphabet" agencies and administrations had been set up, while costs and government employees increased amazingly. Unemployment in May, 1935, was 5.5% greater than a year before. Living costs had been at times 10% above those of 1931. Farm prices rose 23% in 1934 compared with August, 1933. Later, government provisions to buy up surpluses, to subsidize cotton, wheat, and corn farming and other schemes, failed to maintain a higher level for agriculture. The national budget for the year ending June 1, 1934, was 10 billions and in February, 1935, Congress reached an all-time high of a single appropriation for relief, nearly 5 billions, in a gigantic effort to "prime the pump" of national industry.

The Supreme Court.—During the first six years of his administration, the President felt that his liberalizing effort of the government would be invalidated by the old members of the Supreme Court. His liberalizing of the Court brought the first real split in the ranks of the New Deal. The resignations of Justices VanDevanter, Sutherland and Brandeis, and the death of Justice Cardozo gave Roosevelt the opportunity to liberalize the Supreme Court by appointing younger men, namely, Hugo L. Black, Stanley Reed, Felix Frankfurter, Wm. O. Douglas (the youngest man ever appointed to the Court), and later on Frank Murphy. The new appointees, together with liberal Justice Stone, makes the majority of the Supreme Court anti-conservative.

Labor.—The split of the AFL by the John L. Lewis faction into the CIO created labor difficulties throughout the administration. The AFL followed the crafts organization principle while the CIO followed the horizontal organization principle. The Wagner Labor Act of 1937 was administered by the NLRB (National Labor Relations Board) and was considered by the majority of people to favor the CIO as against the AFL. Under this Act, company labor unions were outlawed. Since the Act guaranteed certain rights to workers, radical elements within the organization took unwarranted powers by taking possession of plants and industries by remaining indoors. These were termed "sit-down strikes."

Recovery or Reform.—Roosevelt and Garner were reelected over Landon and Knox by the greatest majority in our history, carrying all states but Maine and Vermont. The Wage and Hour Bill was passed, and government Reorganization was again brought forward. The many restrictions and taxes on business brought a recurrence of depression in the fall of 1937, and unemployment reached a new high of approximately 13,000,000.

The fall elections of 1938 seemed to indicate the country was becoming more interested in Recovery than further Reform, as the "purge" of anti-New Deal Democrats failed with one exception. Many state governments returned to the Republican fold. Congress assembled in January, 1939, with the Roosevelt faction still well in control, but with enough Republicans and conservative Democrats to compel more careful consideration of legislation. Recovery now became the aim of the administration. Harry Hopkins, close advisor of the President, was transferred from head of the WPA to Secretary of Commerce upon the resignation of Secretary Roper.

Foreign Affairs.—The Lima Conference tended to greater solidarity between the nations of the Western Hemisphere. The foreign situation created by Hitler and Mussolini in 1939 brought neutrality and armament to the foreground with large increase in the number of airplanes, and authorization of additions to the army and navy. The outbreak of the German-Polish War, the heroic resistance of Finland to Russia, brought up the issue of Isolationist vs. Interventionist. A great many felt preparations would involve us in war. A neutrality act was passed, but repealed later, as the zone of combat extended as far as Greenland and Iceland. American ships patrolled the Atlantic.

The Third Term.—Roosevelt and Wallace won the 1940 election over Willkie and McNary. All major candidates agreed in principle on foreign policy. Domestic issues were bureaucracy, excessive spending, assumption of power by the President. Early in 1941 defense agencies sprang up and finally conditioned all planning. Employment increased, and relief agencies were retracted. Early in 1942 the C. C. C. was ordered closed down as soon as convenient. The 1943 executive budget called for close to 100 billions, while government employment tremendously increased. The 1943 debt rose to over 200 billions.

Foreign Relations.—The Cash and Carry policy of the preceding year was changed to a Lend-Lease agreement with Britain, and later with other nations. New bases were established in the Americas. Aid was promised Russia, Yugoslavia, Greece, while consulates of the Axis were closed and U. S. credit frozen. Defense equipment was demanded at once. By June the President had declared a national emergency. The nations of the Western Hemisphere began to draw together, and after Pearl Harbor was raided, gradually broke with the Axis, except Chile and Argentina. Chile broke off early in 1943. Brazil made agreements on coffee; Mexico to pay certain agrarian claims of long standing; Peru, and Argentina to exchange more trade. Money was lent to carry out these acts. The Atlantic Charter proposed by Roosevelt and Churchill, in an historic meeting at sea, was followed by conferences in December, 1941, in Washington, and in 1943 at Casablanca in Africa. All came to a climax with the declaration of war on the Axis in December, 1941, and the sending of men to all quarters of the globe in the next year.

Recent investigations show many interesting as well as instructive facts concerning our present national life. A glance at some of these results helps to direct us in planning the work of our own lives as well as that of others. These results have served as a *guide* in the preparation of this department.

Today, our public schools reach practically all our children with at least a minimum of education. A rapidly increasing number of our young people are receiving further training in the secondary or high schools of the country. In the past ten years, the number of students enrolled in the high schools of one of the larger cities has increased from less than 3,000 to over 13,000. At the present time, the board of education in this city is planning for over 20,000 students before 1930. Just recently, the United States Commissioner of Education stated that in his opinion within twenty years a high school education would be as essential as a grade school education is now. It is evident the future will demand fuller preparation of its leaders.

The number of young people who are seeking still further training is so great that they have crowded the classrooms and strained the equipment and faculties of our colleges and universities. The World War placed a great emphasis on the value of education. The trained man was able to render a larger service, and was at the same time able to accept opportunities and responsibilities that were coveted by all.

Statistics of insurance actuaries show us that the percentage of men who gain financial independence is very limited.

A second and, for our purpose, more instructive study has been made as to the kind of preparation made by those who are called successful. The accompanying graph shows in a forceful fashion the relation between the groups considered. See page 422.

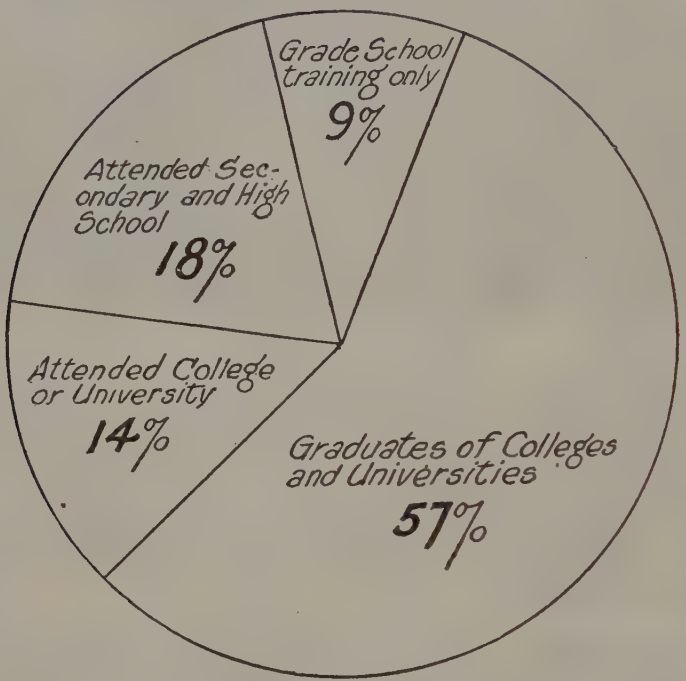
A consideration of this graph cannot fail to emphasize the importance of securing as complete an education as possible. Such an education must include a certain amount of knowledge about the science of mathematics. This has long been deemed second in importance only to a knowledge of how to read and write. In the present social and economic order, each individual must be able to "figure" if he is to protect his own best interests.

Mathematics is the oldest of the sciences. It is also one of the most modern. Developments in recent years have caused writers to call this the golden age of mathematics. The ancients must have known many of its facts and principles long before they built their temples and

pyramids. The earliest written work on the subject yet discovered is a treatise written by a scribe named Ahmes, which dates back to about 1700 B. C. It is a copy, according to its author, of a manuscript which was even then very old, authorities estimating that the original was probably written as far back as 3000 B. C.

After the Egyptians, the Babylonians and the Greeks in turn added to the knowledge of the subject. The great names in the History of Human Thought are all met as one reads the history of this subject. Thales, Plato, Aristotle, Euclid, Archimedes among the ancients, Descartes, Leibnitz, Newton among the moderns are only a few of those whose names are written high by their achievements both here and in other fields as well.

Today, the field of mathematics has become so extensive that students find time to specialize within the subject. Progress is still dependent on mathematics for the tools with which it works. The aeroplane and the radio were perfected by men who knew how to use its principles.



2% Undetermined.

It is still important for one who hopes to take his or her place in affairs to know something of the fundamental principles of the different branches of the science, Arithmetic, Algebra, and Geometry. Many are unable to avail themselves of opportunities offered by institutions of higher education, even though these institutions are supported by the state. Yet one ambitious of better equipping himself for life's tasks can do so by home study as has been dramatically illustrated in our national history. With this in mind, the following sections have been prepared. The arrangement includes work on "Arithmetic in the Early Grades," "The Principles of Arithmetic," "Commercial Arithmetic," "Practical Measurements in Arithmetic," "Algebra," "Plane Geometry," and a "Dictionary of Weights and Measures."

The child needs careful help and direction in the forming of his elementary concept of number. A right beginning is of great importance. The thoughtful parent as well as the earnest teacher will find many valuable plans and useful suggestions here which will help them in leading the child into a correct idea of the meaning of figures. Many new and improved methods are now being used in the early grades. The use of the play instinct is being greatly increased. To any one who has been out of touch with the progress being made in education since the days when they were themselves students of the "Three R's," the following pages will be a revelation.

The section on arithmetic sets forth in simple form with easy illustrations the rules under which numbers may be combined. Integers, fractions and decimals are considered. As each new number is introduced, the various operations, addition, subtraction, multiplication, division, and the extraction of roots are explained and the processes illustrated.

In commercial arithmetic, the problems which arise in transacting one's personal business are considered. Buying and selling goods, borrowing and paying money, commission, interest, insurance and kindred topics are treated.

Everyone has occasion at some time or other to figure areas and volumes of various kinds. How much paper is needed to paper a room, how much carpet to cover a floor, how many shingles

to cover a roof, how much lumber to lay a floor, these and similar questions are answered in the section on practical measurements.

The Dictionary of Weights and Measures is a reference section which contains the value of most of the Standard measures used throughout the world. Constant reference is made to it in the section on Practical Measurements.

In Algebra, the methods of arithmetic are generalized. The student who wishes to become acquainted with the subject for the first time will find the explanations clear and concise. The student who is studying the subject in high school will find the point of view developed here helpful. Those who have finished the work years ago will find the essential rules and principles explained here in convenient form.

The same purpose directed the preparation of the section on Plane Geometry. At all times, the writers of these pages have been mindful of the actual needs of prospective readers. Those who master the work set forth in the following sections, will find before them an interesting and profitable field for further study.

PRIMARY ARITHMETIC.

Arithmetic is the science which deals with numbers. It also refers to the art of computation, or "figuring" with numbers. The word comes from the Greek word, *arithmos*, which means number.

The aims and purposes of present courses in arithmetic may be variously stated. In the preface to one of the leading text books on this subject, the author states that the aim of the book is threefold:

1. To give the pupil skill in the art of computation.
2. To make him a good mathematician.
3. To give him a working knowledge of modern business methods.

In the course of study adopted by the Pittsburgh Public Schools, the aims and objectives of the course in arithmetic are stated as follows:

1. To give the pupils a knowledge of arithmetical facts and processes necessary to interpret and solve the problems met in everyday life, and to develop skill in using them.
2. To develop in the child power to reason accurately in the face of as complicated data as occur in problems adapted to the growth and development of the child.
3. To secure skill, rapidity, and accuracy in the use of numbers required in ordinary business transactions and practical affairs of life.
4. To satisfy the child's felt need for a knowledge of the laws of number and to aid him in interpreting the quantitative relations of life.

In the following pages the best methods of computation and proof of problems are given. Following this theoretical phase of the subject, the problems of business are considered. Problems in mensuration together with many practical illustrations are next developed. The rules and principles are stated in simple language. In many cases, rules are used without attempting to develop them in detail.

While the article on Primary Number Work is arranged principally for the benefit of parents as teachers in the home, it will be found just as practical as an outline for teachers to follow in building up a proper course of study for the first four grades. No text book can solve all the problems that arise in the teaching of arithmetic. The alert teacher is ever ready for new and helpful suggestions.

THE PARENT AS TEACHER.

"Come, now, let us live with our children."

The period of childhood and youth is the strategic period (in the life of the home, the school, the church, and the world), and it is imperative that parents and teachers realize their responsibilities and measure up to them.

The mother is the natural educator of the child in its early years. In early Roman history the mother had entire charge of the child's education during the first six or seven years of its life; only when Rome had begun to decay did she commit their training to nurses and slaves. The Roman mother taught strict obedience, politeness, poems from the great masters, and instructed them in the "Twelve Tables of Roman Law" and thus they came to have respect for authority.

The child's first idea of number concept comes when an infant. All authorities are agreed that the first two or three years of life are the years in which we learn most.

The most important thing in the education of the child is *sense training*. "His mind is like a fallow field, waiting for any seed that may be sown therein,—good, bad or indifferent. The harvest is always sure." Every child learns to talk by its own efforts. It concentrates by listening intently, watching movements of the lips, and practicing sounds all day long. Thus it is important in the early years of a child's life, that he be taught the things that will count most in his mental development—to see, to think and to do.

The development of consciousness of fingers and toes is very important. Every mother should become familiar with Emilie Poulsson's "Finger Plays," such as,

"This is our father,
This is our mother,
This is our brother tall.
This is our sister,
This is our baby,
Oh, how we love them all."

This introduces earliest counting of fingers and toes. In all times and among all nations, finger plays have been a delight to childhood. However, their value is not solely based upon the pleasures derived from them, but by their judicious and early use a foundation can be laid for number concept.

Before the child forms a definite number concept, we find him comparing objects—large, small; round, square; regular, irregular; long, short; much, little—etc.

Let it be urgent that the parent take advantage of this stage in the child's development and help him to arrive at truthful conclusions. He

is constantly making discoveries; hence, he should lead and the parent follow. Give the craving numerical instinct something to work upon and wisely guide it to its richest development. If he were permitted to continue in this process, he would become mentally independent, an investigator rather than a mere learner of facts.

There are few children who do not delight in number work. Counting (the fundamental process in arithmetic) is a thing of joy to them. It is the promise of higher things. The one, two, three of the very small child is the expression of a higher energy struggling for complete utterance. He has acquired some vague idea of numbers because he has been acting under the number instinct—he has been counting and measuring.

No doubt among the early ideas of number, the idea of two is first to appear; his experience has been rich in twos: two eyes, two ears, two hands, two feet. The number three is a much more difficult idea for the child, since it has no seeming relationship to the child's world. It cannot be mastered without the use of higher numbers. It is best taught by contrast or by constructing groups of three with pegs, splints, etc.; in nature we may contrast the three-leaf and the four-leaf clovers. If he knows three he can master counting to the number ten in a few lessons and will have the higher numbers within easy reach. Encourage his counting every thing within his environment.

Play is instinctive with children; hence, we refer you, as a further development in forming number ideas to the games listed under each grade. "Motion Picture," "Climbing the stairs," etc.

Recent developments in home and community life insistently demand a higher order of service and a more economical expenditure of time and energy.

School methods are not yet ideal; under present conditions, it is impossible to adapt subjects and methods to the intelligence of the individual pupil. Children having more or less than average capacity require special treatment. The parent at home has unlimited opportunities to approach the child's number problems—in work and play, on hikes, in confidential talks, and in countless other ways that the routine of the home affords. The closer the learning process comes to being a part of the immediate daily life the more permanent the value of the education.

Boys and girls waste a great deal of time at home because they do not know what to do. They should be doing some type of *constructive* work. Since ingenuity is better than the finished product, every boy should have some sort of work shop at home even though it be equipped very meagerly at first; it will be better equipped when its value is discovered. The person whose every early wish was granted finds it hard to adjust himself to life. Valuable experience could be obtained by utilizing *waste* material; reconstructing old clocks, electric bells; by constructing play houses, toys, air ships, radios, etc. The girl does not call for a special shop, the whole house is hers. These experiences would supply a real need for number work, the ideal condition under which it should be taught.

Children are susceptible to suggestion. Like sheep they follow a good leader. Here is the golden opportunity for the parent.

Children want room to think—their minds must grow as well as their bodies; hence, they are continually asking questions. The common error into which busy parents fall is that of ignoring or rebuking the oft repeated questions of children. Such inquiries should be encouraged. Every indication that the mind is being roused is a mark of progress and all such tendencies should be fostered by the wise parent. Some one has said, "If the pupil could have his individual mathematics lesson as he has his individual music lesson, not one out of a thousand would fail."

The mother of a child two and one-half years old once questioned Darwin as to when she should begin its education. His reply was: "Madam, you have already lost two and one-half years."

NUMBER PREPARATION FOR FIRST GRADE.

Children upon entering school have some number concepts learned through home experiences; therefore, the first problem of the teacher is to make a survey of the lives of the pupils and their environment to find situations which involve number problems.

Such a survey would reveal problems from various sources; such as, games, apportioning of school supplies, cost of school lunches, marketing, disposition of allowance, cost of amusements, etc. Since we proceed from the known to the unknown these should be utilized as a medium for arousing his interest in numbers and incidentally for building a background for work of second grade.

'Tis true, arithmetic, like other subjects, should be taught when the *need* for it arises, yet a definite amount of work should be accomplished in each year of the child's life.

Business men today are constantly complaining that pupils on leaving our schools cannot *add, subtract, multiply* and *divide* and they are hopelessly lost in the simplest problems involving fractions.

If our pupils are to be prepared for life we must aim to have them *completely master the fundamental processes;* however, it is not enough to know these processes, they must be able to "size up" the situation and know when to use them.

"It is the function of the teacher and the text so to present the thing to be done, so to propose the problems to be solved that they require real discovery on the part of the child."

As a preparation for the formal study of combinations it is necessary that the child be able to do the following work:

1. Rote counting 1–100.
2. Counting by 2's, 5's, 10's.
3. Read numbers to 100.
4. Write numbers to 100.
5. Recognize at sight groups of 2, 3, 4, and 5 objects.
6. During the first school year children should become familiar with house numbers, street numbers, telephone numbers, calendar dates, their own weights, ages, etc.

The fundamentally important thing for beginners is learning to count. They should first count objects serially related and later think the symbols that represent them. This counting serves to fix in the pupil's mind the sequence of numbers; therefore,

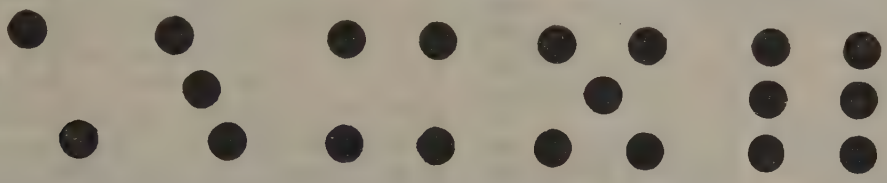
1. Let children count to the bouncing of a ball or to the tapping of a bell. At first count in concert, then individually.

2. Count objects in room: doors, windows, pictures, desks, erasers, piano, gold fish, rabbits, plants, etc.

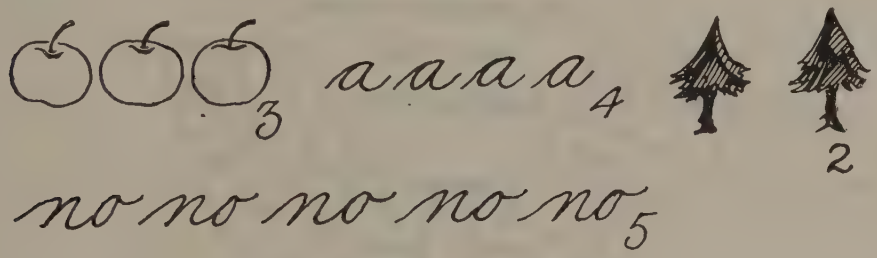
3. Have children tell the number of trees in their yard; automobiles, cars and people passed on their way to school; how many brothers and sisters in the family; how many plates are needed at the table.

4. To count by 2's, have children count hands, feet, eyes, ears; to count by 5's and 10's, use fingers and toes, nickels and dimes.

For practice in recognizing groups, let each home provide some form of blackboard, be it ever so crude, upon which the following groups may be placed with colored crayons:



Have children make groups of simple objects—trees, apples, letters, etc. The Domino Game may be used to advantage in recognizing these groups.



Let the child learn the digits by association with objects; count doors and pictures in the room and let the crayon tell how many there are.

When using Primer teach children to read the numbers of the pages and to refer to them by numbers.

For writing numbers from 1-100, arrange the work in the following manner, building up the form with the child:

0	10	20	30	40	50	60	70	80	90	100
1	11	21	31	41	51	61	71	81	91	
2	12	22	32	42	52	62	72	82	92	
3	13	23	33	43	53	63	73	83	93	
4	14	24	34	44	54	64	74	84	94	
5	15	25	35	45	55	65	75	85	95	
6	16	26	36	46	56	66	76	86	96	
7	17	27	37	47	57	67	77	87	97	
8	18	28	38	48	58	68	78	88	98	
9	19	29	39	49	59	69	79	89	99	

In order to use this form independently, make use of the following game:

Parent:—Touch each number in second column.
Touch all the 20's, 30's, 40's, and read them.
Touch the number after 29, 39, 49, etc.
Touch the numbers beginning with 2, 3, and 5 and read them.
Touch number that tells your age, etc.
Let the child copy this form until he is able to reproduce it from memory.

The following exercise will fix in the child's mind the relative value of the numbers represented by the above figures:

6	4	8	10	7
2	0	14	12	9
1	5	3	13	15

Parent:—Jack may erase the number which means nothing.
Betty may erase the largest number.
Erase the number which tells how many days in the week.
Erase the number which tells how many eyes you have, etc.

Number work may be taught incidentally by association with Physical Training, Music, Paper Folding, Writing and Drawing.

As a rest exercise, we may play "Picking Apples" thus—

Parent:—Pick up two apples. (Children pretend).
Put them into your basket. Now pick up two more apples. Put these into your basket. How many apples have you, John?
John—I have four apples.
Children, eat one apple. (Children pretend).
How many have you now?
Children—We have three apples left.

Occasionally, during the music lesson, children may count tones as they are played on the piano, or sung by the teacher.

In teaching the lines and spaces on the staff, have children use the terms first, second, third, fourth and fifth.

Practice in number work by means of the paper folding lesson can be gained in the following way:

Jimmy, place your paper before you and fold it through the middle. How many equal parts has your paper now?

Jimmy: It has two equal parts.

Parent: Fold it through the middle of each half. How many parts has your paper now?

Jimmy: It has four parts.

Parent: Fold it again through the middle, then again through the middle of each half. Count the squares in your paper. Play this is your school room and number the seats. How many children in the first row? In the second row? How many in all?

In a similar way take advantage of other subjects and activities to teach number work incidentally.

While the exercises suggested above apply particularly to the school room, the parent can find countless opportunities to lead the child to think about numbers in a natural way.

SOCIALIZING NUMBER WORK.

Much has been said in recent years about bringing the school into more intimate contact with the activities and problems of social life. Play is one of the important phases of every day life. The child is by nature very active and should be taught games that have real value.

"The game socializes the child, and since it is through social co-operation that man lives, this activity is a fundamentally important one—educationally. Through games the child learns the fine art of getting on with his fellows, how to co-operate, how to influence, how to lead, when to submit, when to seek help, when to resist, when to command, manners, customs, morals."

GAMES FOR FIRST GRADE.

MOVIES.

Recognition Game.

Let us play we are ushers and help John to find these seats:

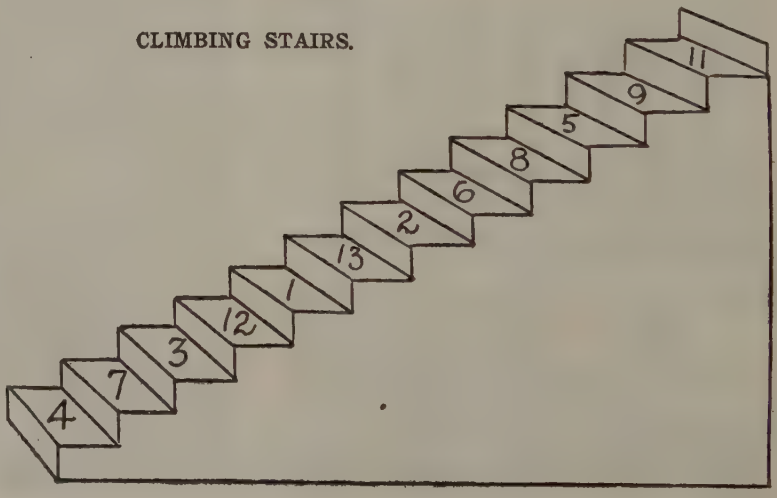
Seat 5	Seat 4	Seat 7	Seat 2
Seat 6	Seat 3	Seat 9	Seat 8

Mary purchased tickets for seats 3, 5, and 7. Sara purchased tickets for seats 2, 4, and 6. Help John to find them.

CLIMBING STAIRS.

Parent: Draw thirteen steps on the blackboard and on each step write one of the numbers from 0 to 12.

Children: Stand in the aisles near their desks, one row at a time. Have each child climb stairs by recognizing figures. If a child stumbles on a step, he must take his seat. The row having greatest number standing at the close, wins the game.



THE TOY SHOP.

Let children contribute toys for the toyshop, such as dolls, balls, blocks, pocket books, etc.

Parent: Let the first store be a "cent shop" where all sorts of toys may be bought for a few cents, nothing should cost more than ten cents.

Children: The shop keeper stands in front of the room near his toys. The other players, all customers—remain in their seats except when they are making purchases. A purchase is made like this:

Customer: What is the price of this doll?

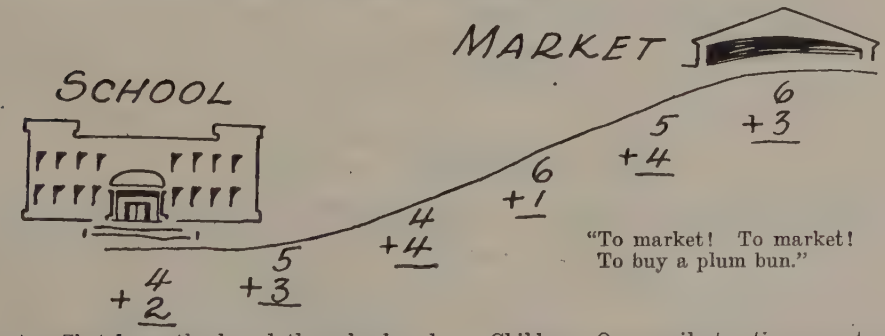
Shopkeeper: That doll is 8 cents.

Customer: I would like that doll if you please. Here is a dime.

Shopkeeper: Your change is 2 cents. Thank you.

GOING TO MARKET.

Easy Combinations.



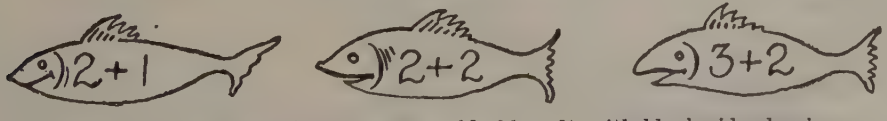
Parent: Sketch on the board the school and a market. Between the two buildings, write several combinations.

A child going to market must recognize each group he meets and call it by name.

Children: One pupil at a time goes to market. If he fails to recognize a group, he can go no further, but must return to school (seat). If he reaches market he should be clapped, etc.

FISHING GAME.

Easy Combinations.



Cut any number of fish from heavy paper. On one side of each fish write a number combination. Place fish in a brook (ledge of the blackboard) with blank side showing.

Parent: Divide class into two parties of fishers. Each fisher stands facing the front, ready

to run forward, when his turn comes to fish. As a signal to begin the parent repeats:

Little fishes in the brook,
I can catch you without a hook.

Players: As soon as the last word of rhyme is spoken, the leader of one row runs quickly to the brook and catches a fish. If he can correctly name his fish (give the result of combination) he takes it to his seat. If not, he must put it back into the brook. The leader of the other row immediately follows, and so on until all have tried.

The party having the larger catch, wins the game.

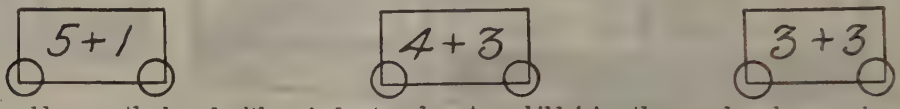
THE CALLER.
Counting Game.

Parent: Send one child into the cloakroom. Give each of the remaining children a number—not higher than 20.

Children: Players in their seats must listen attentively, while the child who has been sent out raps on the door for admittance. Suppose the caller knocks at the door seven times. The parent says: Who is wanted? If Alice has been given the number seven, she should promptly reply:

"I, seven, am wanted," and change places with the caller by taking her place in the hall. Should Alice fail to recognize her number the caller raps again, (a different number of times.)

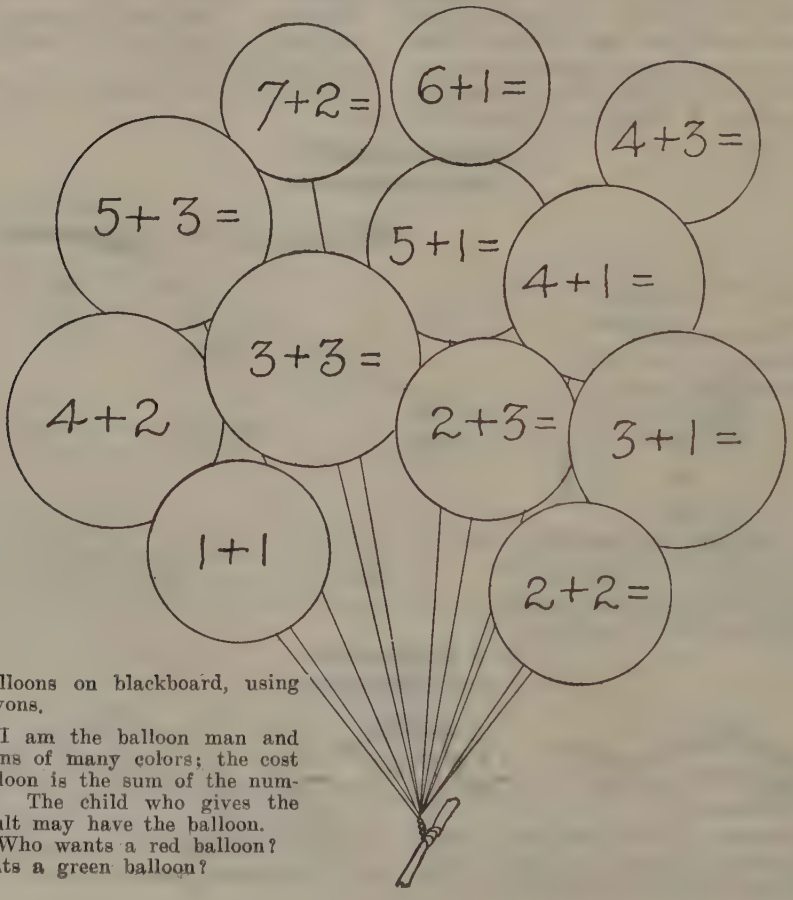
JOINING THE PARADE.



Draw oblong on the board with a circle at each of the lower corners. Call these drawings the "circus parade" and write numbers on them.

Any child joins the parade, who can give combinations correctly.

THE BALLOON GAME.
Easy Combinations.

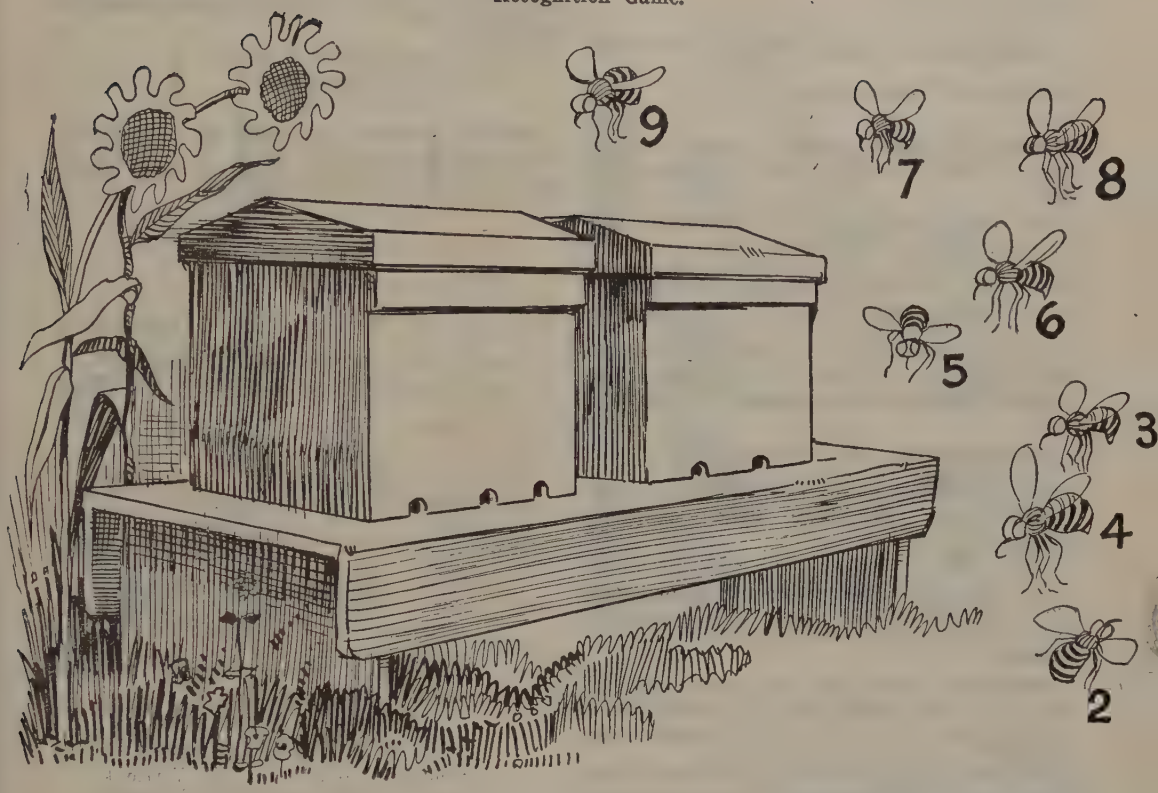


Draw balloons on blackboard, using colored crayons.

Parent: I am the balloon man and have balloons of many colors; the cost of each balloon is the sum of the numbers on it. The child who gives the correct result may have the balloon.

Parent: Who wants a red balloon? Who wants a green balloon?

BEE HIVE.
Recognition Game.



Draw on the board a beehive around which a number of bees are swarming, and number each bee. Have the child try to get all the bees into the hive by recognizing the numbers. When he fails to give the correct number he has been stung by that bee and the next child takes his turn.

SECOND GRADE NUMBER WORK.

The child upon entering the second grade should have a thorough review on the basic work of the first grade. "A woodchopper who takes time in the morning to sharpen his ax, will soon make up the time thus taken out."

Children memorize facts and form mental habits easily; and, since "First impressions are the lasting impressions," it is important when learning the basal facts, that they form correct habits which are to serve them through life.

The aim of the second grade should be to complete the following work:

1. The 45 Combinations in Addition.
2. Counting, Reading, Writing Numbers to 1,000.
3. The Subtraction Process.
4. The Addition Process.
5. Simple Units of Measure.
6. United States Money.
7. Introduction to Fractions.

The 45 combinations can be made an interesting game. Its value will be greatly increased if the child is encouraged to develop his own number cards. The cards will look like this:

1
1
2

1	2	3	4	5	6	7	8	9		2	3	4	5	6	7	8	9		
1	1	1	1	1	1	1	1	1		2	2	2	2	2	2	2	2		
2	3	4	5	6	7	8	9	10		4	5	6	7	8	9	10	11		
3	4	5	6	7	8	9		4	5	6	7	8	9		5	6	7	8	9
3	3	3	3	3	3	3		4	4	4	4	4	4		5	5	5	5	5
6	7	8	9	10	11	12		8	9	10	11	12	13		10	11	12	13	14
	6	7	8	9				7	8	9					8	9		9	
	6	6	6	6				7	7	7					8	8		9	
	12	13	14	15				14	15	16					16	17		18	

The following lesson will suggest one way in which these cards may be used:

Parent (Pointing to $\frac{2}{\frac{4}{6}}$): This combination means 6. Show me another card that means 6.

John chooses $\begin{array}{r} 5\ \ 3\ \ 4 \\ 1\ \ 3\ \ 2 \\ \hline 6,\ 6,\ 6. \end{array}$

Parent: You may write all the combinations which mean 6. John writes: $\begin{array}{r} 1\ \ 5\ \ 2\ \ 4\ \ 3 \\ 5\ \ 1\ \ 4\ \ 2\ \ 3 \\ \hline 6,\ 6,\ 6,\ 6,\ 6. \end{array}$

Parent: You have 6 rabbits. Four are white and the others are gray. Tell how many are gray.

The child is naturally active—mentally and physically—and it is important that the parent keep him mentally alert and interested in his work. It is more realistic to learn that 5 and 4 are 9 by counting children, pictures, toys, etc., than by merely using abstract numbers.

The ingenious parent can easily provide something pleasing to the child by letting the season and the child's environment suggest the problem, as

Halloween: Black cats, witches, owls.
Thanksgiving: Turkeys, pumpkins.
Christmas: Santa Claus, Christmas trees, bells.
Washington's Birthday: Flags, hatchets, cherries.
Easter: Eggs, chickens, rabbits.

The child should be encouraged to originate problems from his experience; it will not only be a source of delight, but also an aid in clear thinking.

Subtraction. By leading the child to see that these same combinations can be expressed in a different manner, we have laid the foundation for the Additive Method of Subtraction.

This method is fast coming into use in the business world; it naturally follows the addition combinations since it does not require the introduction of a new idea; it eliminates "borrowing" and substitutes the "carrying" idea which is a part of the addition process; it is also the method used in making change.

Suggestive Lesson.

Parent: You may bring me 4 balls, Mary. Now bring one more ball. How many balls have I now?

Mary: You have 5 balls.
Parent: What kind of problem is that?
Mary: It is a problem in addition.
Parent: I am going to teach you a new kind of problem. Let us throw one ball away. How many have we left?
Mary: We have 4 balls left.
Parent: You know this because the ball we threw away and the 4 we have left make 5 balls. We had 5 balls and one rolled away. How many have we left?
Mary: We have 4 balls left.
Parent: How do you know?
Mary: Because it takes one more than 4 to make 5.
Parent: Let me show you a new way to write it:

5 balls
−1 ball (rolled away)
—
4 balls (left)

Parent (Pointing to sign): We call this sign "minus." It means "take away" or "subtract." The following jingle helps to fix the method of procedure:

"Begin at the sign 1
Go to the bottom 4
Go to the top" 5

Similar problems involving the subtraction idea (sell, fly away, give away, etc.) should be given—the child repeating the jingle as he points to the figures.

8	7	6
−1	−3	−4
7	4	2
1 and 7 are 8	3 and 4 are 7	4 and 2 are 6

Parent: We can make a large problem by writing these figures close together and using only one sign:

$$\begin{array}{r} 876 \\ -134 \\ \hline 742. \end{array}$$

Mary (pointing to numbers) repeats: 4 and 2 are 6; 3 and 4 are 7; 1 and 7 are 8.

Parent: Today we shall learn how to do examples like this:

$$\begin{array}{r} 723 \\ -169 \\ \hline 554 \end{array}$$

In this example 9 is more than 3, so we think. "9 and 4 are 13." Write 4 and carry 1 to 6. 7 is more than 2, so we think. "7 and 5 are 12." Write 5 and carry 1 to 1. "2 and 5 are 7." Write 5.

Borrowing Method.

$$\begin{array}{r} 723 \\ -169 \\ \hline 554 \end{array}$$

In this example we think:
"9 from 13 are 4." Write 4.
"6 from 11 are 5." Write 5.
"1 from 6 is 5." Write 5.

Never teach more than one method to the primary child.

Column Addition. The first step in column addition is to show the need for adding more than two numbers.

Parent: Mary, let the chalk tell how many plates we need at the table. (Parent, talking as she writes.)

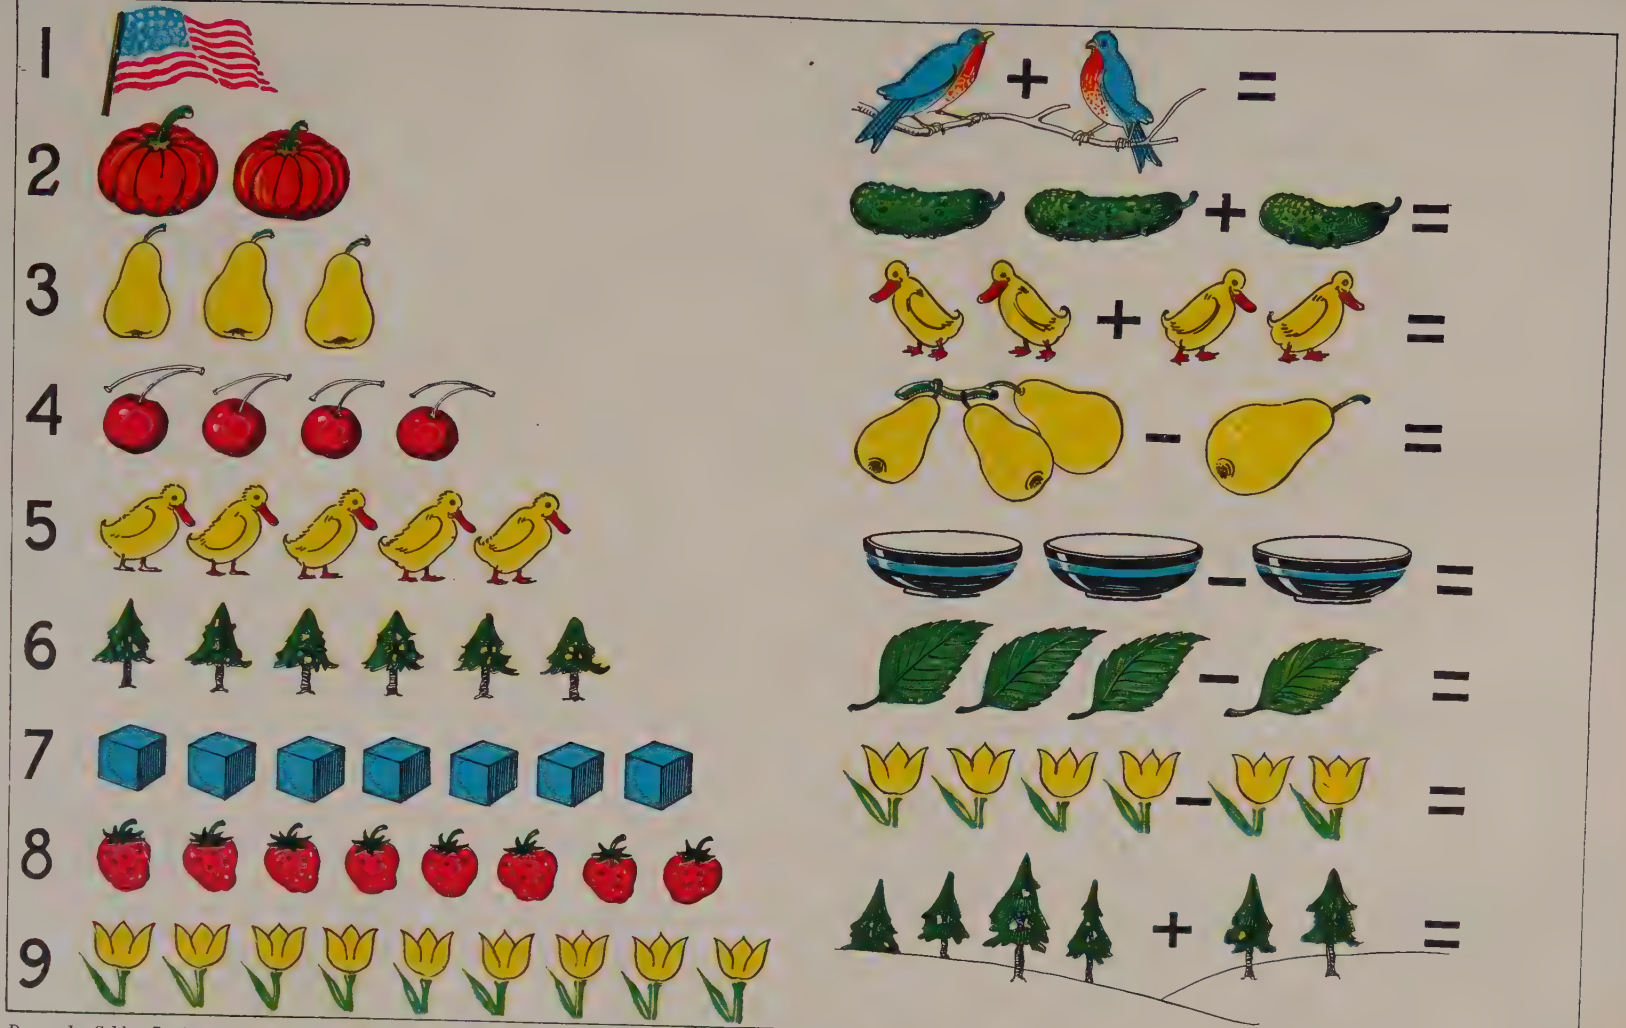
1 Father
1 Mother
3 Brothers
1 Mary
2 Sisters
—
8 Plates needed

The next step is to add by endings. Lead the child to see that a certain combination appears each time as the end of the example:

$$\begin{array}{rrrrrr} {\scriptstyle 2)} & {\scriptstyle 2)} & {\scriptstyle 2)} & {\scriptstyle 3)} & {\scriptstyle 3)} & {\scriptstyle 3)} \\ 12 & 32 & 52 & 12 & 42 & 62 \\ \hline 14 & 34 & 54 & 15 & 45 & 65 \end{array}$$

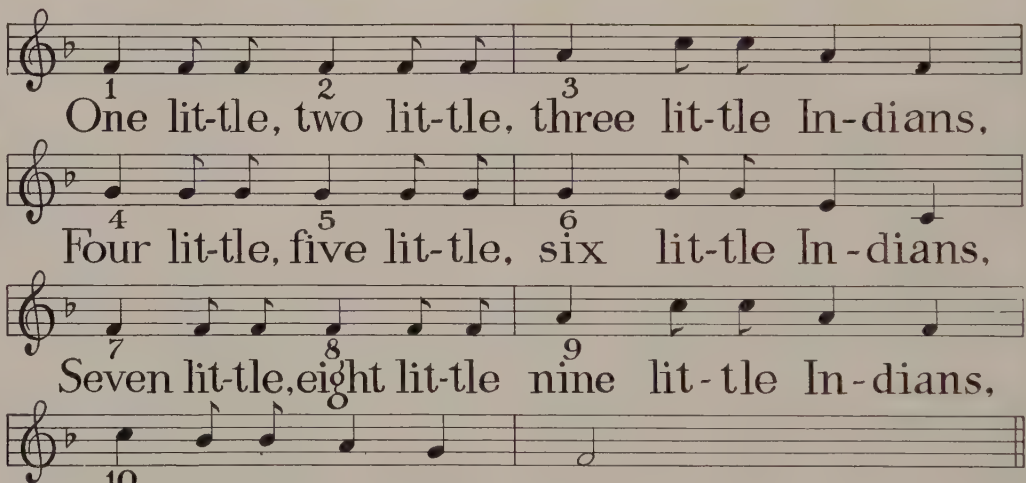
$$\begin{array}{rrrrrr} {\scriptstyle 4)} & {\scriptstyle 4)} & {\scriptstyle 4)} & {\scriptstyle 5)} & {\scriptstyle 5)} & {\scriptstyle 5)} \\ 13 & 33 & 23 & 13 & 73 & 93 \\ \hline 17 & 37 & 27 & 18 & 78 & 98 \end{array}$$

When the sum of the endings is 10 or more, write only the last figure of the sum and carry



Drawn by Selden Irwin

NUMBER WORK



1 2 3
One lit-tle, two lit-tle, three lit-tle In-dians,
4 5 6
Four lit-tle, five lit-tle, six lit-tle In-dians,
7 8 9
Seven lit-tle, eight lit-tle nine lit-tle In-dians,
10
Ten lit-tle In-dian boys.

Drawn by Selden Irwin

TEN LITTLE INDIANS

1 (or more) to the next column. Gradually increase the difficulty and length of the column.

			2	6	7	24	37	21
			4	1	1	36	25	62
			3	7	3	43	15	75
			5	8	4	21	13	20
7	7	7	6	2	6	62	41	33
3	13	24	1	3	2	10	20	51
10	20	31	21	27	23	196	151	262

Insist that work be accurately done the first time.

Reading and Writing Numbers. Since the child already knows how to read and write numbers to 100, he can easily learn to read 300, 600, 800, etc, by merely changing the digit in 100 to some other number. Emphasize the fact that hundreds requires three numbers.

Parent (writing 47): Read this number.
Mary: Forty-seven.

Parent (placing 1 before 47 and calling the one, 100): Read this number.
Mary: One hundred forty-seven.
Parent (changing 1 to 5): Read it now.
Mary: Five hundred forty-seven.

Numbers in which zero appears may require special attention. He should write similar numbers from dictation.

Writing in thousands requires four figures.
Parent: What number is one more than 999?
Mary: One thousand.
Parent: Read this number—527.
Mary: Five hundred twenty-seven.
Parent (placing 1 before 527): Read it now.
Mary: One thousand five hundred twenty-seven.

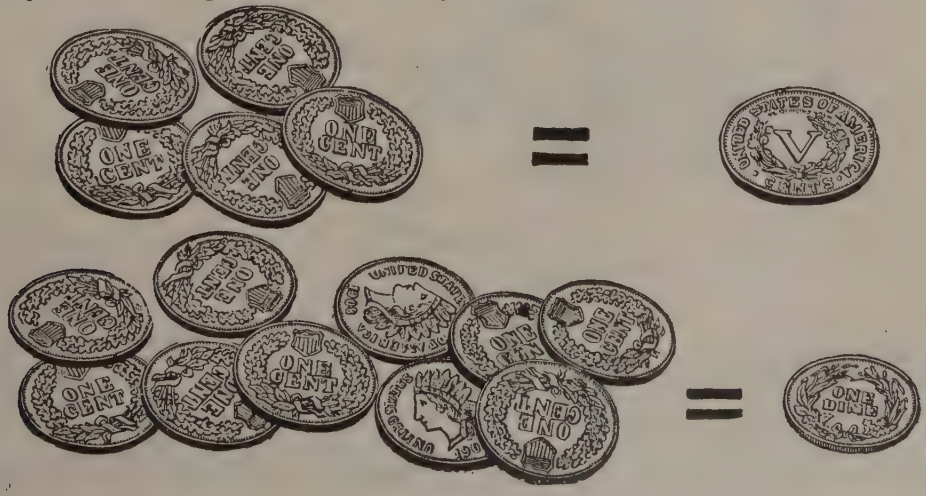
Continue in this manner until the child can write any number containing four figures.

Telling Time. Early number training may include occasional lessons in "Telling Time." Let the child draw a clock on the blackboard.

Parent: Show me how the clock looked when you went to bed. When you ate breakfast. When we ate lunch. When sister came home from school. When father came home from work, etc.

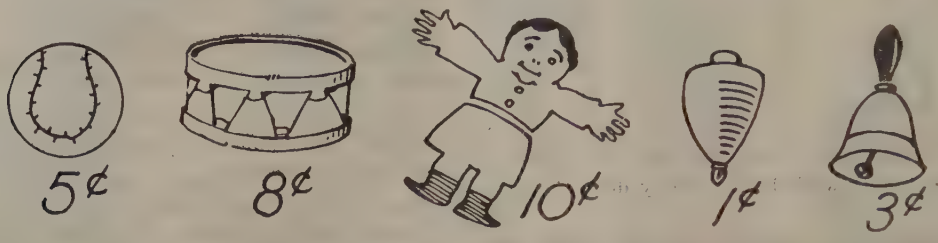
Money Values. Through the use of real money teach the child to recognize and to know the value of the cent, nickel, dime, quarter, half-dollar and dollar bill.

If possible provide toy money so that the child may play store and learn to make change from a nickel, a dime, a quarter.



Help him to make lists of articles that are for sale and teach him to write the cost of each.

If you sell a ball and a bell, how much will you receive for both articles?



More and more we are coming to realize the priceless need of "thrift." Take your child to the savings bank to get a deposit book such as "big folks" have, and encourage him to save a part of his weekly allowance. This habit involves more than the mere saving of money; it is moral training in self-denial, reasoning, and a correct attitude toward the family finances. History teaches that thrify nations prosper and thriftless ones pass away. "Economy means happy homes and sound nations. Instil it deep."

Measurements. Kindergarten and primary construction work—making the simplest kind of box, scrapbook or doll's house, all require measuring. The more accurate the measurements are, the better will be the results.

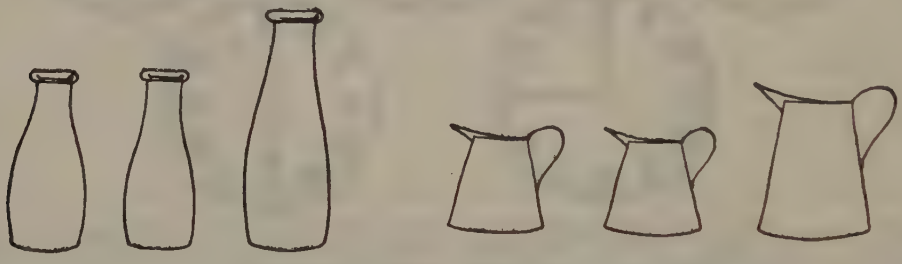
Parent: What measures do people use to find how tall they are?

Parent: Using ruler, measure your blackboard. How long is it? How wide?

Measure the table, door, window-sill, and tell how wide they are.

Using yard stick, tell how long and how wide the rug is.

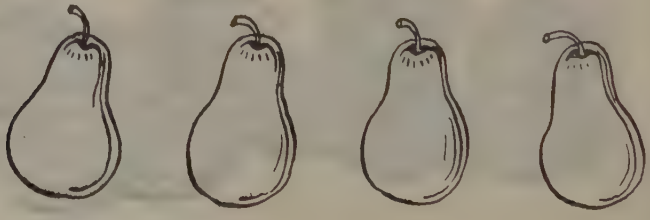
Parent: What measure does your teacher use when she finds your weight? How much do you weigh? To insure correct weight you should drink at least one quart of milk each day. What part of this amount should you drink in the morning? At noon? In the afternoon? In the evening?



Introduction to Fractions. The child's experience in sharing things with others can be utilized to introduce fractions; and, in a simple way he can grasp all four ideas:

1. Part of single object.

2. Part of group of objects.

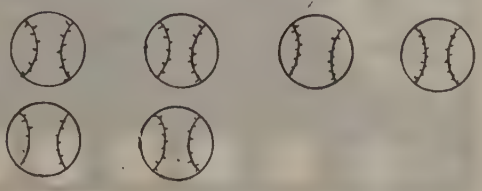


3. Comparison of two single objects.

NICKEL

DIME

4. Comparison of two groups of objects.



In a conversational way lead the child to see that one of the two equal parts into which a unit is divided equals ½; that two units equals ½ of a group of four units; that one article may equal ½ the value of another article; that a group of three objects is ½ as large as another group containing twice as many similar objects.

This incidental work in simple fractions is all that is necessary in second grade.

GAMES FOR SECOND GRADE.

TRAIN RIDE.

The gatekeeper distributes tickets containing number facts. Each child shows his ticket and *if he knows the combination* passes into the car. Each child places his hands on the shoulders of the child in front of him and when the train is made up the bell rings and they are off for a run around the room.

GATHERING NUTS.

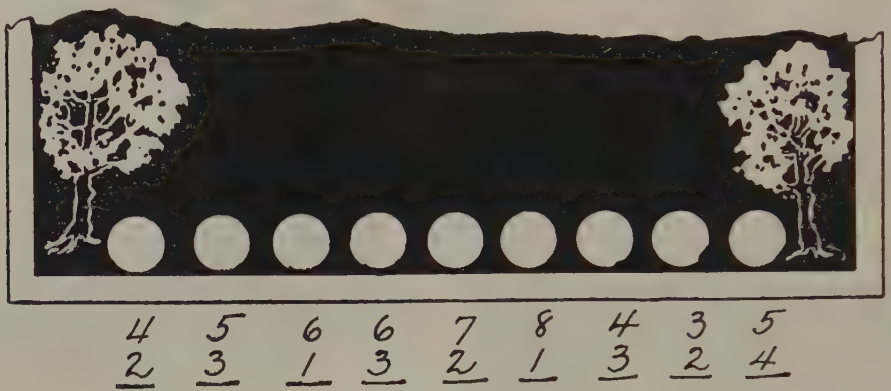
Cut any number of four-inch circles from pasteboard. These will represent the nuts. On each "nut" write a combination.

Parent: On the blackboard, at some distance apart, roughly sketch two trees. On the ledge of blackboard place the nuts with blank sides toward the class. Divide the players into two groups of nut gatherers.

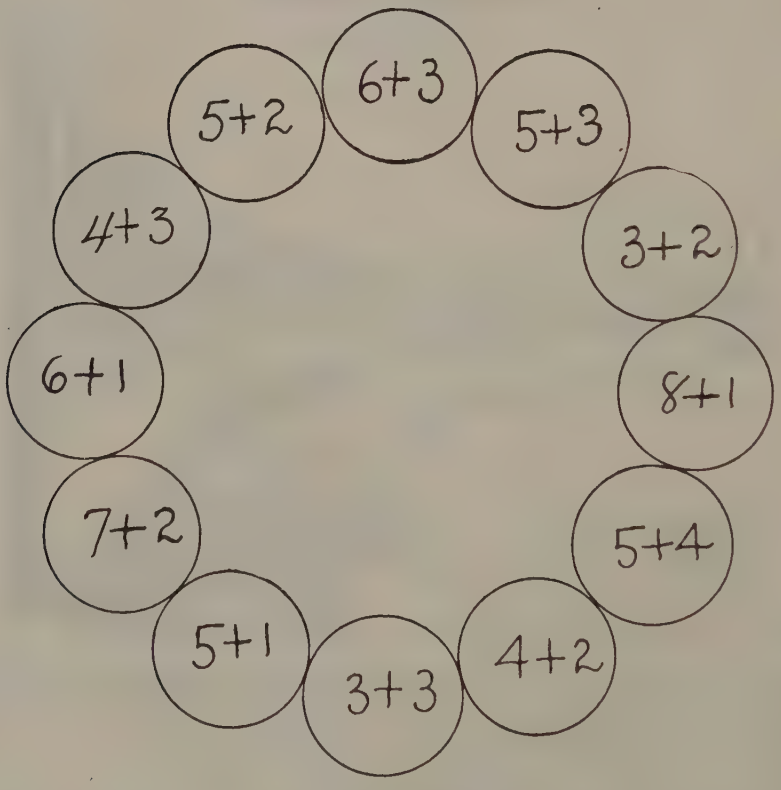
Players: At a signal from the parent—the first child on one side runs quickly to the board

and picks up a nut. If he gives the correct answer to the combination he may pick up another. If that result is also correctly given he may have one more nut. No player may have more than three nuts. The first player on the other side follows; then the second player on first side, etc.

The parent keeps score, and the side gathering the greater number wins the game.



THE MERRY-GO-ROUND.

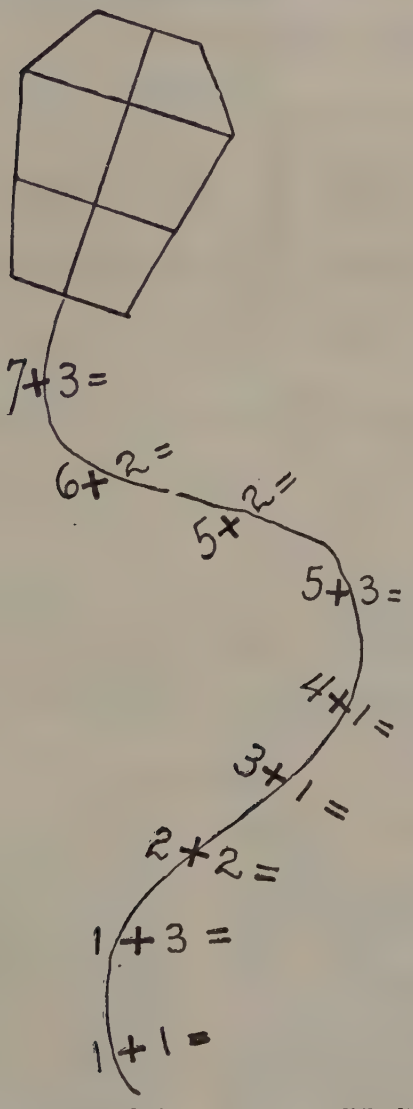


Material: None required.

Parent: Draw circles on blackboard. The circles represent the rings that hang from the bars of the merry-go-round.

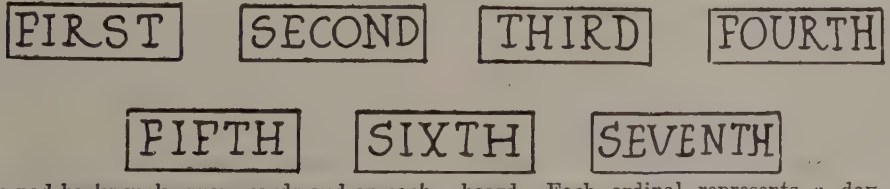
Children: Let the children pretend they are riding on a merry-go-round. A ring is taken when the result of the combination in that ring is correctly given. John has the first ride. He tries to ride fast and catch all the rings he can. When he misses a ring, another player takes a ride. Clap every rider who takes all the rings.

FLYING THE KITE.
Combinations.



When the early spring days come much interest can be created by playing this game. Each child will be anxious to fly the kite higher than his playmate. The addition facts should grow more difficult as they near the top. The child begins at the bottom and if possible gives all the combinations. If he fails on one, another child must assist in order to fly the kite higher.

DAYS OF THE WEEK.



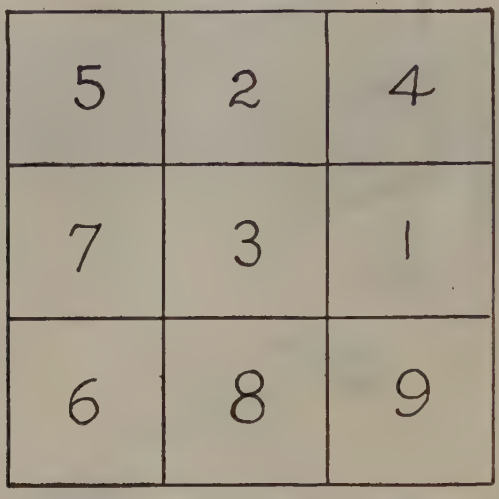
From pad backs make seven cards and on each write one of the seven ordinals. Stand cards in irregular order on the ledge of the blackboard. Each ordinal represents a day of the week.

Parent: Take away one of the cards and call upon a child to arrange the remaining cards in their right order.

Children: The player chosen to arrange the cards, must give the name of the missing ordinal. If answer is given correctly, the players in their seats should clap.

The Months of the Year may be played in the same way.

HOP SCOTCH.



Parent: Draw on the blackboard a square and divide it into nine smaller squares. In each square write a figure. Divide the class into two rows facing the diagram.

Players: Start with the figure in the center. Then go in any direction, giving the sum of the combination, as: 3 and 9 are 12; 3 and 6 are 9; 3 and 5 are 8. Players take turns—one side and then the other. If a child fails to "hop" (give the combination correctly), he must take his seat. The side having greatest number of players standing at the close wins the game.

THE POSTMAN.

Pieces of pasteboard to represent post cards, or use old post cards.

Parent: Let children "make believe" the aisles are streets and the desks are houses. Choose two players for postmen. Give each postman a pack of post cards to deliver.

Children: Make believe it is Xmas, Thanksgiving, New Year's Day, Valentine Day. Postmen start on their rounds from opposite sides of room. They go down one street, and up the next, leaving cards at every house (any number not to exceed 5 may be left). After postmen have finished their rounds, each child tells how many cards he received.

John says: "The first postman left me 4 cards, and the second postman left me 3 cards, so I have 7 cards altogether."

Mary says: "The first postman left me 5 cards and the second gave me 4—I have 9 cards in all."

Parent: Instead of collecting the cards, let each child mail them by bringing the cards and telling the amount of postage required.

John brings his cards and says: I want 7 one-cent stamps for my cards. Here are a nickel and two pennies. (He may make believe the money is in any form that he chooses).

THIRD AND FOURTH GRADE NUMBER WORK.

The beginning of each year is always the time for balancing accounts; most of the world then weighs its best efforts in order that it may know just where it stands. Mankind's seeming need for renewal and refreshment is proverbial; this is especially true in the learning process,—therefore, begin the work of the third grade with a thorough review of second grade work.

Automatic mastery of the fundamentals is the chief objective of the third and fourth grades. It is impossible to do effective work in the upper grades until that of the previous grades has been mastered.

Obtaining correct results with minimum effort is important. With this end in view the child should have frequent, short, snappy drills.

"If one wishes to produce correct number habits with the least possible expenditure of energy and time he should permit no exceptions,—the correct answer must be given every time," for no matter how the child responds to number work—correctly or incorrectly—the tendency of the nervous system is to respond in that same way again.

"Our nervous systems have grown to the way in which they have been exercised, just as a coat, once creased or folded, tends to fall forever in the same identical folds."

As soon as the new processes—Multiplication and Division—have been learned, they should immediately be used in problems and when difficulties arise, time should be taken for drill. The child will then be convinced that drills are necessary, and if they are varied from day to day, it will be easier to secure a high degree of attention. A short, snappy drill daily is much more valuable than a long drill occasionally.

Insist upon accuracy. Teach the child that "similar" does not mean "same." Make him call things by their correct names. "He can learn anything that is important to him if the power to learn is secured;" as mechanics say, "when one has learned the use of tools it is easy to learn a new craft."

One of the chief causes of failure in arithmetic is the child's inability to interpret the problem; hence, solving problems without numbers (telling the processes to be used and why) is a valuable aid to clear thinking.

Remember, it is not what the child is told to do, but what he *does* that educates him.

Aim:

Multiplication.
Division.
Measurements (Continued).
Money Values (Continued).
Fractions (Continued).
Roman Numerals.

Multiplication. The child already knows:

0	1	2	3	4	5	6	7	8	9	10	11	12
+0	+1	+2	3	4	5	6	7	8	9	10	11	12
0	2	4	6	8	10	12	14	16	18	20	22	24

also

2	2	2	2	2	2	2	2	2	2	2	2
	2	2	2	2	2	2	2	2	2	2	2
	4	2	2	2	2	2	2	2	2	2	2
		6	2	2	2	2	2	2	2	2	2
			8	2	2	2	2	2	2	2	2
				10	2	2	2	2	2	2	2
					12	2	2	2	2	2	2
						14	2	2	2	2	2
							16	2	2	2	2
								18	2	2	2
									20	2	2
										22	2
											24

Lead him to see that the same thing can be expressed in a shorter way by using a different sign (×) and saying "times."

The sign is not always written but when told to multiply we must *think* the sign.

0	1	2	3	4	5	6	7	8	9	10	11	12
×2	×2	×2	2	2	2	2	2	2	2	2	2	2
0	2	4	6	8	10	12	14	16	18	20	22	24

Multiplication can also be expressed in this way:

$2 \times 0 = 0$. Think—"Two times zero equals zero."
$2 \times 5 = 10$. Think—"Two times five equals ten."

```
 93   Think—"Two times 3 is 6."  Write 6
  2   under 2.
 --   Think—"Two times 9 is 18."  Write 18
186   to the left of 6.

 96   Think—"Two times 6 is 12."  Write 2,
  2   remember 1.
 --   Think—"Two times 9 is 18."  18 + 1 (re-
192   membered) = 19.
```

The number by which we multiply is called Multiplier.

The number multiplied is called Multiplicand.

The result is called Product.

Drill problems:

24	63	82	50	45	56	95	38	89
2	2	2	2	2	2	2	2	2

The other basic tables should be developed in a similar manner. The child should then be ready to use the following table for drill work:

MULTIPLICATION TABLE.

	2	3	4	5	6	7	8	9	10	11	12
1	2	3	4	5	6	7	8	9	10	11	12
2	4	6	8	10	12	14	16	18	20	22	24
3	6	9	12	15	18	21	24	27	30	33	36
4	8	12	16	20	24	28	32	36	40	44	48
5	10	15	20	25	30	35	40	45	50	55	60
6	12	18	24	30	36	42	48	54	60	66	72
7	14	21	28	35	42	49	56	63	70	77	84
8	16	24	32	40	48	56	64	72	80	88	96
9	18	27	36	45	54	63	72	81	90	99	108
10	20	30	40	50	60	70	80	90	100	110	120
11	22	33	44	55	66	77	88	99	110	121	132
12	24	36	48	60	72	84	96	108	120	132	144

TWO-FIGURE MULTIPLIER.

```
735   First, multiply 735 by 5. Be sure
 25   to write each figure in its proper
----  place.
3675  Then multiply 735 by 2. Place the
1470  first figure of your product (0)
-----  under the multiplier (2) and keep
18375  all figures in straight columns.
```

The sum of the numbers between the lines (18,375) is the product.

THREE-FIGURE MULTIPLIER.

```
1048   The three-figure multiplier is a
 432   continuation of the above process.
----   When multiplying by 4, notice that
2096   the first product number (2) is
3144   placed directly under the 4 of the
4192   multiplier.
-----
452736
```

Be careful to place the first figure in each partial product exactly under the figure by which you are multiplying. (1 under the 3) (8 under the 4).

SUGGESTIVE PROBLEMS IN MULTIPLICATION.

School Supplies.

Tablet	5¢	Crayon	10¢
Pencil	5¢	Paints	25¢
Ink	10¢	Brush	10¢
Pen	5¢	Eraser	5¢

What materials do you need in your school work? What would your supply cost? There are 30 pupils in your class. What would it cost to supply each one with a pencil? What would the crayon supply cost? What would be the total cost of all the supplies listed above for your class?

843	986	846	387	618	425	372
56	37	76	396	392	160	406

DIVISION:

PREPARATORY DRILL FOR SHORT DIVISION.

How many 2's in	How many 3's in	How many 4's in
24	36	48
8	18	24
10	6	4
16	30	36
2	15	8
8	3	44
12	12	12
18	21	32
6	9	16
14	27	28
22	9	20
4	24	40
20		

Continue this drill with 5's, 6's, 7's, 8's. 9's.

After thorough drill in preceding work take up each table in the following way—teaching *remainder*:

How many 3's in:

3 = 1	18 = 6
4 = 1 + 1	19 = 6 + 1
5 = 1 + 2	20 = 6 + 2
6 = 2	21 = 7
7 = 2 + 1	22 = 7 + 1
8 = 2 + 2	23 = 7 + 2
9 = 3	24 = 8
10 = 3 + 1	25 = 8 + 1
11 = 3 + 2	26 = 8 + 2
12 = 4	27 = 9
13 = 4 + 1	28 = 9 + 1
14 = 4 + 2	29 = 9 + 2
15 = 5	
16 = 5 + 1	
17 = 5 + 2	

When dividing by 3 no remainder can be greater than 2. When dividing by 4, no remainder can be greater than 3. In division, a remainder can never be as large as the divisor.

Short Division:

32 — How many 2's in 6? 3. Write 3 over 6.
2 ∫ 64 — How many 2's in 4? 2. Write 2 over 4.

29 — How many 2's in 5? 2 and 1 remaining.
2 ∫ 58 — Write 2 over 5 and think 18 instead of 8.
How many 2's in 18? 9. Write 9 over 8.

$76\frac{1}{2}$ — How many 2's in 15? 7 and 1 remaining.
2 ∫ 153 — Write 7 over 5 and think 13 instead of 3.
How many 2's in 13? 6 and 1 remaining.
Write 6 over 3 and a small 1 to represent the remainder.

The number divided is called Dividend.

The number by which we divide is called Divisor.

The result in division is called Quotient.

23 — Divide: How many 21's in 48? (First think how many 2's in 4) 2. Write 2 over 8.
21 ∫ 483
42 — Multiply: 2 × 21 = 42
63 — Subtract: 48 − 42 = 6
63 — Compare: 6 is less than 21. Bring down 3.
Divide: How many 21's in 63? Write 3 in quotient over 3 in dividend.
Proof: 21 × 23 = 483.

Remember the order: Divide, Multiply, Subtract, Compare.

230 — When partial dividend is "zero," place zero in the quotient over zero in dividend.
21 ∫ 4830
42
63
63
0
Proof: 21 × 230 = 4830.

Suggestive Problems in Division:

A gardner planted 1575 cabbage plants in 15 rows, with an equal number in each row. How many plants were in each row?

A train of 17 cars contained 2448 barrels of potatoes. What was the average number of barrels in one car?

If 25 lots sell for $37,500.00 what is the average price of a lot?

Mary promised to read 180 pages of a book about gardening. How long would it take her to read it at the rate of 20 pages in one hour?

78)13555 73)8328 47)5766 29)8976

Measurements:

LIQUID MEASURE.

2 pints = 1 quart
2 pt. = 1 qt.

4 quarts = 1 gallon
4 qt. = 1 gal.

How many pints will fill 4 quart bottles?
How many quarts will fill a 3 gallon jar?
How many pints in one gallon?
How many gallons in 12 quarts?
How many quarts in 2 gallons?

How many gallons in 16 pints?
A family uses 3 pints of milk each day. How many quarts of milk do they use in four days? How many gallons? How many gallons will they use in 6 days?

MEASURE OF LENGTH.

12 inches = 1 foot. 3 feet = 1 yard.
12 in. = 1 ft. 3 ft. = 1 yd.

Draw three lines of different lengths. Have the child measure them in inches and in feet.

Have the child draw a line 12 inches long.

Have the child draw a line 3 feet long. How many inches in this line?

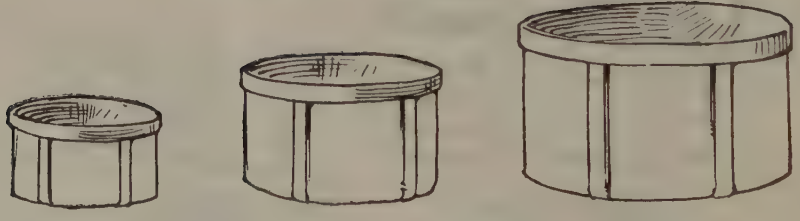
How many inches in 1 yard?

MEASURE OF WEIGHT.

16 ounces = 1 pound 16 oz. = 1 lb.

How old are you?
How tall are you?
How many pounds do you weigh?
How many ounces in 5 pounds?
How many pounds in 32 ounces?

DRY MEASURE.



2 pints = 1 quart
8 quarts = 1 peck
4 pecks = 1 bushel

2 pt. = 1 qt
8 qt. = 1 pk.
4 pk. = 1 bu.

How many pecks are there in 2 bu.?
How many quarts are there in 2 pecks?

How many quarts are there in one bushel?
How many pints are there in one peck?

MEASURE OF TIME.

The numbers on this clock are *Roman Numerals*. The Romans used the letters I, V, L and C to write numbers from one to one hundred.

I means	1	IV means	1 less than 5
V means	5	VI means	1 more than 5
X means	10	XL means	10 less than 50
L means	50	LX means	10 more than 50
C means	100	XC means	10 less than 100

The long hand measures the time in minutes; the short hand tells the hour. It takes the long hand 5 minutes to go from one number to the next. How long does it take it to go from XII to IV? What is the time when the long hand is on the XII and the short hand at VI?

60 minutes = 1 hour	60 min. = 1 hr.
24 hours = 1 day	24 hr. = 1 da.

How many minutes in 3 hours? In one-half hour?

How many hours in 4 days? In one-half day?

7 days = 1 week	7 da. = 1 wk.
12 months = 1 year	12 mo. = 1 yr.
52 weeks = 1 year	52 wk. = 1 yr.

How many days in one week? Name them.

How many months in one year? Name them.

Look at the calendar and name the months that have 30 days, 31 days. Name the month that has less than 30 days.

Memorize:

Thirty days hath September,
April, June and November;
All the rest have thirty-one,
Except the second month alone,
Which has but twenty-eight in line,
Till leap year makes it twenty-nine.

How many days in 5 weeks? How many days in the months of August and September?

How many weeks in 56 days? How many weeks in 3 years? How many months?

MONEY VALUES.

Show by using real money that:

A nickel	= 5 cents
A dime	= 2 nickels; 10 cents
A quarter	= 2 dimes and a nickel; 5 nickels; 25 cents
A half-dollar	= 2 quarters; 5 dimes; 10 nickels; 50 cents

The game of playing store is the best method of teaching money values to the child, as it involves problems of buying and selling. Teach him how the grocer counts change. John's purchase amounted to 7 cents and he gave the grocer a quarter. Begin with the amount of the purchase and say: 7, 10, 20, 25.

When the need arises teach the child how to write numbers meaning dollars and cents, thus introducing the dollar sign ($). A period called the decimal point is always placed between dollars and cents. Cents are written in two places at the right of the decimal point.

Thus 7 dollars and 25 cents is written: $7.25. 5 dollars and 5 cents is written: $5.05.

Milk bills and grocery bills may be used to illustrate the need for a knowledge of U. S. money.

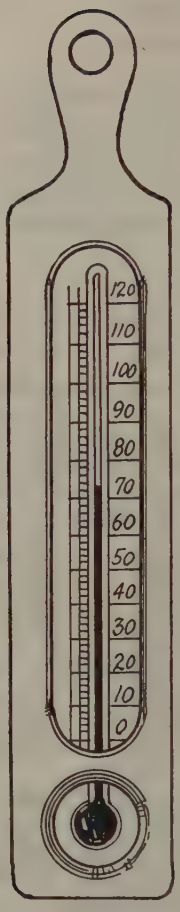
"Playing Cashier."

Tell how you would make change for the following purchases:

4 cents from a nickel.
2 cents from a dime.
8 cents from a quarter.
35 cents from a half dollar.
61 cents from 75 cents.
17 cents from a dollar.
60 cents from a two-dollar bill.
50 cents from a five-dollar bill.

When giving drill problems, insist upon the correct position of the decimal point:

$132.05	$535.43
+ 29.50	− 40.85
$161.55	$494.58
$75.43	$127.15
× 8	5)$635.75
$603.44	



MEASURING TEMPERATURE.

Temperature is measured by a *Thermometer* and is marked in degrees. (Sign = °.) Water freezes at 32°. It boils at 212°. Zero is 32° colder than freezing point.

Heat causes the mercury to rise; cold causes it to fall.

The temperature of the blood is 98°.

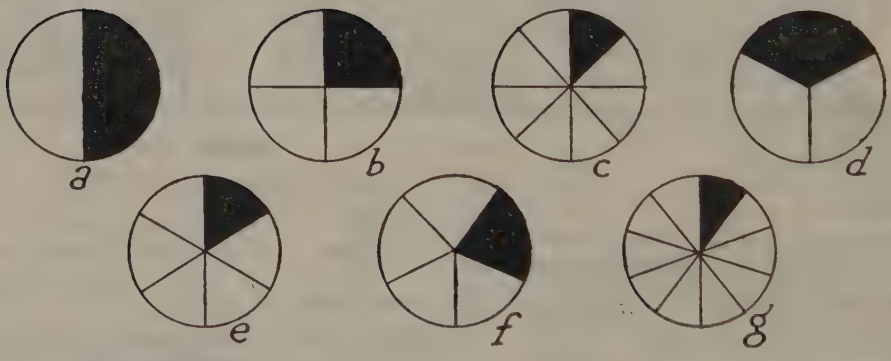
The temperature of your room should be 68°.

On January 10th, the mercury fell from 12° above zero to zero.

How much colder was that?

How many degrees too warm is your room when the temperature is 75°?

When mother was sick her temperature was 105°. How much above normal was that?



FRACTIONS.

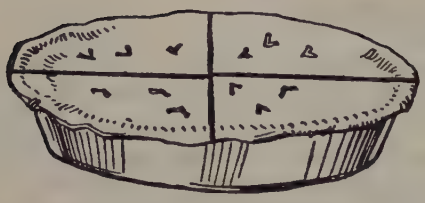
To introduce and to develop the fraction idea in its simplest forms is the aim of the first four grades.

In an informal way they should know ½, ¼, ⅛, 1/3, 1/6, 1/5, 1/10 of objects and groups of objects.

The circle (a) is divided into two equal parts. Each of these parts is a half of the whole circle; that is, each is a fraction of a circle. Each part, or fraction, is one-half, which is written ½.

Another circle (d) is divided into three equal parts; each of these parts is called one-third, and is written 1/3.

The circle (f) is divided into five equal parts, each of which is called one-fifth and is written 1/5.



Into how many equal parts is this pie divided? How many persons would it serve?

When anything is divided into four equal parts we call each part one-fourth.

Mother cut two pies into fourths. How many pieces would that be?

How many halves in one pie? How many fourths?

How many fourths in one-half?

If mother and John each ate one-fourth of a pie, what part would remain?

Mary, how shall we divide this cake so that you and each of your two playmates may have equal parts?' Into three parts.

When anything is divided into three equal parts, we call each part one-third (1/3).

When two of these parts are taken, the fraction is called two-thirds (2/3).

Follow the above plan to develop fourths, eighths, sixths, fifths, tenths.

Before beginning the work of the fifth grade the child should know the meaning and use of the terms, *fraction, numerator,* and *denominator.*

A fraction is one or more of the equal parts into which a unit is divided. It is expressed by means of two numbers, one over the other, separated by a line.

Thus, ¾ is a fraction. 4 is called the *denominator* and means that something has been divided into fourths. 3 is called the *numerator* and means that three of these parts have been taken.

A clear idea of the above terms and the ability to use easy fractions insures a valuable foundation for the work of the next grade.

PROBLEMS WITHOUT NUMBERS.

If you know what percent you have in each of six lessons, how would you find your average grade?

If you know the cost of a quart how can you find the cost of a peck?

If you know the cost of a pint of milk and use one quart per day, how can you find your milk bill per week?

If you know the cost of a daily paper and the cost of a Sunday paper, how would you find the cost of your papers per week?

Given the daily temperature for one week, how would you find the average temperature for that week?

Given the number of pupils in a class, and the total cost of supplies, how would you find the cost of supplies for each pupil?

Given the number of stamps on one page and the cost of each stamp, how would you find the amount of money invested per page?

Given the salary per month and the expenses per month, how would you find the amount saved?

SUGGESTIVE PROJECTS IN NUMBER WORK.

The child should be given opportunities to originate problems. Projects that are worked out in a social way not only stimulate thought in arithmetic, but also provide worth-while drill in spelling, writing and English.

Father's automobile cost $1,600.00. He paid $15.00 extra for a bumper, $6.00 for a mirror, $4.00 for a clock, $20.00 for a spare tire. What was the total cost? If the car depreciated $500.00 the first year, what was it worth then?

On our trip this car traveled 50 miles on 10 gallons of gasoline. How far did it travel per gallon?

If gasoline is worth 25c per gallon, what was the total cost of gasoline? If depreciation amounted to 4c a mile, cost of oil ½c a mile, wear on tires 2c per mile, find the total cost for the 50 mile trip.

Five passengers traveled in this car. If they had traveled by rail at 4c per mile, what would have been the total cost?

Similar projects may be developed using the following ideas:

Birthday parties, picnics, gardening, banking, building a radio, camping trip, school lunches, etc.

GAMES FOR THE THIRD AND FOURTH GRADES.

BEAN BAG.
Addition Facts.

Draw this diagram on the floor with chalk. Several feet away a line is drawn behind which the player stands and throws a bean bag toward the center. Each player is given two throws and his score is the sum of the two numbers hit. In order to get this score the child must state the sum of the two numbers correctly.

OF WHAT ARE YOU THINKING?

(Table Drill.)

Material: No material required.

Parent: Have children form in a circle around one of their number.

Children: The player in the center of the circle must think of a result in a multiplication table.

The players in turn ask the "Thinker" such questions as: "Are you thinking of 4×9?" The answer may be: "No, I am not thinking of 36." The next player may ask: "Are you thinking of 3×8?" "No, I am not thinking of 24." The third may ask: "Are you thinking of 6×7?" If the thinker has in mind 42, he answers: "Yes, I am thinking of 42." When the right guess is made, the "Questioner" and the "Thinker" change places.

After three calls and failures to guess correctly, the "Thinker" tells his combination and then chooses another one.

AN AEROPLANE FLIGHT.

Subtraction Facts.

	6	8	7	9	5	4	8	9	6	8	9	7	
Washington	−1	−5	−4	−2	−3	−1	−6	−6	−4	−3	−7	−3	San Francisco
	—	—	—	—	—	—	—	—	—	—	—	—	

Fly from Washington City to San Francisco. Each error means a stop for repairs. See if you can make a record flight.

THE TUG OF WAR.

(Table Drill.)

Material: None.

Parent: Two rows of children at a time may play this game. The parent names a table to be written on the blackboard and at a given signal the "Tug of War" between the two rows begins. The signal may be given in this way:

"The tug of war will now begin,
The stronger side will surely win."

Children: At the word "win" the first in each of the two rows runs quickly forward and writes on the blackboard the first step of the table. As soon as he finishes writing, the second child immediately follows and writes the second step of the table. Going to the blackboard a child leaves his seat from the right hand side and returns on the left—thus avoiding danger of collision. The third child follows the second, and so on. The row which finishes the table (correctly) first is the stronger and wins the "Tug of War." Let the other children clap. When the first and second rows have tugged, the third and fourth rows have a contest, and so on. Change about so that the same rows shall not always compete; the first and third rows, and the second and fourth rows, etc.

MOTORING TO NEW YORK.

(Table Drill.)

6	7	8	9	7	5	6	7	9	8	8	5	6	4	7
×7	×7	×6	×6	×4	×9	×6	×9	×9	×9	×8	×7	×5	×9	×6
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Each failure to give the correct product means a delay. Try to get to New York on schedule time.

FORMAL ARITHMETIC.

What number is. The word number comes to have meaning to the child early in his school life if he does not form this idea even earlier. At first it is difficult to get him to think in terms of numbers rather than in terms of things. Slowly the idea takes form. The one, two and many are replaced by a system of counting. Five comes to mean something of itself instead of a group of things, as five fingers, five apples, five pennies and so forth. *Numbers* are the things we use in arithmetic.

What arithmetic is. Arithmetic is the science of numbers and the art of computation. The word itself comes from the Greek word, *arithmos*, which means number.

After the child learns to count with numbers, he must learn to read and write numbers. The writing of numbers is called *notation*. The reading of written numbers is called *numeration*.

There are two systems of notation in more or less common use today. The first is known as the *Arabic system*. It is so called because it was introduced into Europe by the Arab traders of the tenth and eleventh centuries. This method of notation is really of Hindu origin and is very old. The figures or symbols now used are very different from those used in olden times but the method of arrangement is unchanged.

The other method of writing numbers is known as the *Roman System* of notation. Numbers are not so easily written in this system nor are they so readily read. Computation is difficult with them. For these reasons, Roman numerals are not used in the solution of problems. They are used mostly to mark the hours on watches and clocks; to designate the chapters and sections of books; to number the pages of extra material in books, as in the introduction or the appendix; and to mark dates in inscriptions on monuments and buildings.

NOTATION AND NUMERATION.

Roman numerals. In writing a number with Roman numerals, seven letters are used.

I = 1; V = 5; X = 10; L = 50; C = 100; D = 500; M = 1,000.

1. A straight line placed above a letter multiplies its value by 1,000. Eg., $\overline{V}$ = 5,000 etc.

2. The same letter written twice, means double the number; written three times, it indicates three times the number. Eg., XX = 20. CCC = 300.

At one time I was written four times to indicate 4, five times to indicate 5, and so on. In time the upper half of the X came to mean half of ten and was written V. To meet a similar problem, L came to mean 50 and D to mean 500. This called for additional rules.

3. If a letter folows a letter of greater value, its value is added to the value of the greater letter. Eg., XI = 10 + 1 = 11. CL = 100 + 50 = 150.

4. If a letter comes before a letter of greater value, its value is subtracted from the value of the greater letter. Eg., XL = 50 − 10 = 40. CM = 1,000 − 100 = 900.

The number is written thousands first, then hundreds, tens and units. The following examples show how numbers are written in this system.

Numbers to one hundred are written in the following manner.

I	1	XX	20
II	2	XXX	30
III	3	XL	40
IV	4	L	50
V	5	LX	60
VI	6	LXX	70
VII	7	LXXX	80
VIII	8	XC	90
IX	9	C	100
X	10		

The years are written as follows.

MCMXXVI = 1926
MCMXXVII = 1927
MCMXXVIII = 1928
MCMXXIX = 1929
MCMXXX = 1930

Arabic numerals. The Arabic system makes use of ten signs or symbols, called *figures*. They are

1, 2, 3, 4, 5, 6, 7, 8, 9, 0.

These figures are also called *numerals* or *digits*, and by their use any number can be written.

The figures are written in a horizontal line. Each has a value determined by the place it occupies in the number represented. The value of each figure, however, is always equal to the value of the figure when it stands alone multiplied by some power of ten. For this reason, this method of reading and writing numbers is also called the *decimal system*.

Numbers are divided into *periods* of three figures each beginning at the right of the number. The figures and the periods are named to enable one to read them readily.

Billions Period			Millions Period			Thousands Period			Units Period		
Hundred Billions	Ten Billions	Billions	Hundred Millions	Ten Millions	Millions	Hundred Thousands	Ten Thousands	Thousands	Hundreds	Tens	Units
7	2	8,	4	3	6,	5	0	9,	1	4	3

This number is read "*seven hundred twenty eight billion, four hundred thirty six million, five hundred nine thousand, one hundred forty three.*"

Do not use "and" between the periods.

Additional periods to the left of billions are called trillions, quadrillions, quintillions, etc.

Unless stated to the contrary, the word number is used to refer to numbers in the Arabic system.

Kinds of numbers. In arithmetic, three kinds of numbers are used. They are called *integers*, *fractions*, and *decimal fractions* or *decimals*.

INTEGERS.

A *unit* is a single thing or a group of things thought of as one.

An *integer* is a whole number. It is made up of one or more units. It is represented by a figure or a group of figures, as 3, 7, 36, 407.

Abstract numbers are numbers used without reference to things. Problems using numbers of this kind are called abstract problems. They are used for purposes of instruction and drill.

Concrete numbers are numbers used to denote a certain group of things or quantities. Problems using numbers of this kind are called concrete or practical problems. A great deal of emphasis is being placed upon problems of this kind at present. They should deal with questions that arise in the actual experience of the pupil. Examples of this kind of number are 5 days, 7 quarts, 3 dollars, 6 miles, etc.

An integer which when multiplied by another integer gives a number, is called a *factor* of the number. 2 is a factor of 4, of 6 and of 10. Factors of 12 are 2, 3, 4 and 6. Some writers speak of 1 and the number itself as being factors of the number. It is apparent that every integer has 1 and itself as factors.

A *prime number* is a number which has no factors except itself and 1. It is often valuable to know if a number is prime. Tables are printed showing all prime numbers up to several millions. Many numbers do not need to be considered in testing for prime numbers.

All numbers ending in 0, 2, 4, 6, or 8 have 2 as a factor and are called *even numbers*. No even number except 2 is prime.

All numbers ending in 5 have 5 as a factor. Except 5 itself, no such number is prime.

Numbers which are not even numbers are called *odd*. It follows from the above that all prime numbers greater than 2 are odd numbers.

The prime numbers to 100 are as follows,

2,	3,	5,	7,	11,	13,	17,
19,	23,	29,	31,	37,	41,	43,
47,	53,	59,	61,	67,	71,	73,
79,	83,	89,	97,			

Integers which are not prime are called *composite* numbers.

If a number is a factor of two or more numbers it is a *common factor* of the numbers.

Two numbers which do not have a common factor are said to be prime to each other or *relatively prime*.

If a factor is a prime number, it is called a *prime factor*.

The largest number that is a factor of two or more numbers is called the *greatest common factor* of the numbers.

A number is a *multiple* of any of its factors. It may be thought of as a *common multiple* of two or more of its factors. Thus 12 is a multiple of 2 and of 3, etc. or it is the common multiple of 4 and 6.

The *least common multiple* of two or more numbers is the smallest number that has both the given numbers as factors. Thus 12, 24, and 36 are all common multiples of 4 and 6, but 12 is their least common multiple.

FUNDAMENTAL OPERATIONS.

The four fundamental operations of arithmetic are *addition*, *subtraction*, *multiplication*, and *division*. Numbers are combined with one another in accordance with certain laws. These laws or rules must be carefully developed to see how they work for the three kinds of numbers used in arithmetic.

There are certain axioms or truths that must be accepted by the student of any science. In elementary arithmetic, these truths are not even stated to the child. A collection of the axioms commonly used in mathematics is given in connection with the section on geometry, Par. 18. Attention is here called to only two. 1. Things equal to the same thing are equal to each other. 2. The whole is equal to the sum of all its parts and is greater than any of its parts.

ADDITION.

Addition is the process of collecting two or more numbers into one equivalent number.

The numbers combined are called the *addends*.

The result obtained by the process is called the *sum*.

Any number of abstract numbers can be added together.

In adding concrete numbers, it is necessary that they refer to the same kind of things or quantities.

The sign of addition is +, read *and* or *plus*.

The sign of equality is =, read *equals* or *is equal to*.

Example. Add 7,246, 51 and 398.

7, 2 4 6	
5 1	Addends
3 9 8	
7, 6 9 5	Sum

In adding, write the numbers so that figures of the same order will be in the same column. Begin at the right. Add the units column. Write the unit part of the sum in the units column "carrying" the tens part to the next or tens column. Repeat this process, writing each time the units part of the sum in the column just added, carrying the tens part of the sum to the next column.

In the example, the sum of the units is 15, write the 5 and carry 1 saying 1 + 9, etc. The sum of the tens column is 19, write the 9 and carry 1. The sum of the hundreds column is 6, write the 6. There is nothing to carry. The sum of the thousands column is 7, write the seven.

In adding columns of figures, speed will be gained if the numbers are added in pairs or groups of numbers as indicated in the accompanying illustration.

7
3 10
9
4 13
6
5 11
1
2 6
3
40

In adding, do not repeat the numbers. Say six, seventeen, thirty, forty.

With a little practice, the student will be able to add by this method in much shorter time than formerly. This method assumes a thorough knowledge of the 45 combinations which are explained in the work relating to the second grade. These combinations should be learned so that the numbers 4 and 9 in the above problem together with the idea of addition mean 13. *Speed as well as accuracy is to be gained if one is to become a good arithmetician.*

Problems in arithmetic must be worked correctly. Even when all possible care is taken, mistakes will be made. In order to be sure of a result, every problem should be tested or checked. This checking is an important part of the problem. Even in banks where adding machines are used for speed and accuracy, the figures are all checked a second time to make sure that the wrong key was not pressed by the operator.

There are several methods used to prove or check problems in addition.

1. *Add beginning at the top.* In the example, say 10, 23, 34, 40.

2. *Divide the column into two parts, add each part separately, then add the sums.*

3. *Add each column separately,* writing the units of each sum under the column added. *Then add these sums.* This method is illustrated in the accompanying example.

4, 318
5, 684
6, 857

15
1 7
14
19

16, 859

4. *Casting out the nines.* This is accomplished by finding the *excess* of each of the numbers over 9. By the *excess* is meant the remainder when the number is divided by 9. The excess is readily found due to the fact that the excess of any number over 9 is equal to the excess of the sum of its digits over 9.

To test addition by casting out the nines, find the excess over 9 of each of the addends and of the sum. The excess of the sum of the excesses of the addends must equal the excess of the sum if the problem is correct.

EXAMPLE.

74,826 Sum of Digits = 27, Excess = 0
36,519 Sum of Digits = 24, Excess = 6
42,680 Sum of Digits = 20, Excess = 2
51,432 Sum of Digits = 15, Excess = 6

205,457, Sum of Digits = 23, Excess = 5

Sum of excesses = 0 + 6 + 2 + 6 = 14, Excess = 5. Check.

This test does not give an absolute check to the accuracy of a problem. Numbers may be interchanged or mistakes may cancel each other. The test may be applied very rapidly, however, and is much used by accountants and others.

This method is much shortened in practice by dropping of "casting out" nine every time the sum of the digits becomes equal to or greater than 9. In the above problem, starting in the top row, say 7 + 4 = 11, cast out 9, 2 + 8 = 10, cast out 9; 1 + 2 + 6 = 9, cast out 9; 0 + 3 = 3, 3 + 6 = 9; etc, getting 5 as the remainder in the addends. Any combination which gives 9 may be ignored. In practice, casting the nines out of the sum, say 2 + (ignoring the combination 54) 5 + 7 = 14 gives 5 as the excess of the sum over 9.

SUBTRACTION.

Subtraction is the process of finding the difference between two numbers.

The *minuend* is the larger of the two numbers, or the number from which the other is to be subtracted.

The *subtrahend* is the number to be subtracted. It is the smaller of the two numbers.

The *difference* or *remainder* is the number left after subtraction.

The sign of subtraction is —, read *minus.*

There are three methods of subtraction in more or less common use in this country.

7426
5638

1788

First Method. Since 8 cannot be taken from 6, "use" one ten from the tens column. Say 8 from 16 leaves 8, write the 8 in the units column in the answer. Since one ten was used, say 3 from 11 leaves 8, write the 8 in the tens column. In this step 1 was used from the hundreds column. Say 6 from 13 leaves 7, write the 7 in the hundreds column. In this step one was used from the thousands column. Say 5 from 6 leaves 1, write the 1 in the thousands column.

Second Method. The principle in this method is the same as that used in the first method. Here, the number that is "borrowed" from the minuend, is "paid back" to the subtrahend. Say 8 from 16 leaves 8, write the 8. The one that was "borrowed" is added to the 3 in the subtrahend. Say 4 from 12 leaves 8. 7 from 14 leaves 7. 6 from 7 leaves 1.

Third or Additive Method. Advocates of this method insist that it makes use of the adding principle and the 45 fundamental combinations. Also that it is the natural method for most counting. The ordinary practice in making change is an example of this method.

In the example the student finds the figures in the remainder by asking himself the following questions.

8 + how many = 16? 8 + 8 = 16. Write 8.

The one borrowed for the 6, is repaid to the 3 in the subtrahend.

4 + how many = 12? 4 + 8 = 12. Write 8, and 1 to carry.

7 + how many = 14? 7 + 7 = 14. Write 7, and 1 to carry.

6 + how many = 7? 6 + 1 = 7. Write 1.

A recent survey shows that the first method is most used in our schools, at this time. Any

one of these methods is satisfactory. Select the one you prefer and use it always.

Test all problems in subtraction by adding the remainder to the subtrahend. The sum should be the minuend.

Other tests. The problem may also be checked by subtracting the remainder from the minuend, getting the subtrahend as the new remainder.

The method by casting out the nines will also work in this case but is no shorter than either of the other methods and is not so sure a check. For this reason it is not often used in subtraction problems.

Subtraction is the reverse of addition. Hence, *only like numbers can be subtracted from each other.*

Drill by counting. Proficiency in addition, can only be attained by drill on the fundamental operations. This drill may be varied somewhat by "counting" by twos, threes, fours, and so on, starting with any number between 1 and 10. To drill on subtraction, start with any number in the nineties and count backwards by different numbers.

Counting by twos; 1, 3, 5, 7, ...
Counting by fives; 3, 8, 13, 18, 23, ...
Backward by sixes; 98, 92, 86, 80, 74, ...
Backward by nines; 95, 86, 77, 68, 59, ...

MULTIPLICATION.

Multiplication is the process of taking one number as many times as there are units in another.

The *multiplier* is the number with which one multiplies.

The *multiplicand* is the number multiplied.

The multiplier and the multiplicand are factors of the result of the process which is called the *product.*

The sign of multiplication is ×, read *times* or *"multiplied by."*

The multiplier is always considered as an abstract number. The multiplicand may be either abstract or concrete.

In multiplying two numbers together, either number may be taken as the multiplier and the other as the multiplicand.

To multiply two numbers together, write one number above the other as in the example, being careful to have units under units, tens under tens, etc.

Starting at the right, multiply by the units digit, writing the partial product so that its right hand figure will fall in the units column. Then multiply by the tens digit, writing this partial product so that its right hand figure will fall in the tens column. Continue till all the figures of the multiplier are exhausted.

Add the partial products to find the product.

EXAMPLE. Multiply **1024 by 564.**

1024 Multiplicand.
564 Multiplier.

4096 First partial product.
6144 Second partial product.
5120 Third partial product.

577536 Total product.

Interchanging the multiplier and multiplicand gives,

564 Multiplicand.
1024 Multiplier.

2256 First partial product.
1128 Second partial product.
564 Fourth partial product.

577536 Product.

The third partial product, obtained by multiplying the multiplicand by zero, is not written. The fourth partial product is written with its right hand number in the thousands place.

Tests of Multiplication.

1. *Multiply the multiplier by the multiplicand.* See above.

2. *Divide the product by either the multiplier or the multiplicand.* The result must be the other number.

3. *Casting out the nines.* Cast the nines out of the multiplicand, multiplier, and product. The excess of nines in the product of the excesses of the multiplier and multiplicand must equal the excess of nines in the product.

EXAMPLE.

1024 Excess = 7.
564 Excess = 6.

4096
6144
5120

42 Excess = 6.

577536 Excess = 6.

Short methods of multiplication.

1. To multiply a number by 10, 100, 1000, etc, annex one, two, three, etc., zeros to the number.

$48 \times 10 = 480.$ $48 \times 1000 = 48000.$

2. To multiply a number by 5, 50, 500, etc. annex one, two, three, etc., zeroes to the number and divide by 2.

$48 \times 50 = 4800$ divided by $2 = 2400.$

3. To multiply a number by 2.5, 25, 250, etc., annex one, two, three, etc., zeroes and divide by 4.

$48 \times 25 = 4800$ divided by $4 = 1200.$

4. To multiply by a number near 100, take 100 times the multiplicand and, if the multiplier is less than 100, subtract the product of the multiplicand and the difference between the multiplier and 100. If the multiplier is greater than 100, add the product obtained in this manner.

$$428 \times 97 = 42800 - 428 \times 3.$$
$$= 42800 - 1284.$$
$$= 41516.$$

Speed in multiplication depends upon a thorough knowledge of the 45 combinations in multiplication. This comes through drill and constant practice. Cards such as are used in teaching the combinations in addition can be used to great advantage. Drill at this work until the pairs of numbers with the thought of multiplication *means* the answer. In the applications of arithmetic, one should not need to stop to figure out simple problems in computation. The results should be ready for use when needed.

DIVISION.

Division is the process of finding how many times one number is contained in another num-

ber. It is also the process of dividing or separating a number into a certain number of equal parts.

The *dividend* is the number to be divided.

The *divisor* is the number by which to divide.

The *quotient* is the result obtained by division. It indicates how many times the divisor is contained in the dividend.

The *remainder* is the amount of the dividend that is left when the divisor is not a factor of the dividend. It is obviously less than the divisor.

The sign of division is ÷, read "divided by."

In division, the numbers may be either concrete or abstract. If both are concrete, they must be the same kind of number.

Division is indicated in several ways, as

$24 \div 6$; $6\overline{)24}$; $\frac{24}{6}$; etc.

EXAMPLE.

```
                 771 Quotient
          ------------
Divisor 758 ) 584676 Dividend
              5306
              ----
               5407
               5306
               ----
                1016
                 758
                ----
                 258 Remainder.
```

The first group of figures that will contain the divisor is 5846. 758 is contained in this number 7 times. This is a partial quotient and is to be written in the quotient over the last number in the dividend that is used, in this case over 6. The product of this partial quotient and the divisor is written under the part of the dividend used. Subtract, getting 540 as a remainder. Bring down the next number in the dividend. This gives 5407 as the new or partial dividend. The divisor is contained in this number 7 times with a remainder of 101. Write this partial quotient over the number brought down. Bring down the 6 and divide 758 into 1016. It is contained once, with a remainder of 258. Write this partial quotient over the 6 which was brought down, completing the quotient. The remainder, 258, is often written 258/758.

This process is repeated till all the digits in the dividend have been used.

If, at any time, after a figure is brought down, the partial dividend is still too small to contain the divisor, write 0 in the quotient over the number brought down and bring down another figure.

The above method of solution is called *long division.*

In dividing by a single number, the multiplication and subtraction is performed mentally. The process is called *short division.*

```
Divisor 7 ) 52486 Dividend
            -----
             7498 Quotient.
```

When there is no remainder, as in the above problem, one number is said to be contained *evenly or exactly* in the other.

Tests of Division.

1. *Multiply the quotient by the divisor and add the remainder to the product so found.* The result will equal the dividend if the division is correct.

2. *Casting out the nines.* Cast out the nines from the divisor, dividend, quotient and remainder. Multiply the excess in the quotient by the excess in the divisor. To the excess in this product add the excess in the remainder. The excess of this sum will be equal to the excess of the dividend if the division is correct.

In the example of long division above,

Quotient = 771.	Excess = 6.
Divisor = 758.	Excess = 2.
6 × 2 = 12.	Excess = 3.
Remainder = 258.	Excess = 6.
3 + 6 = 9.	Excess = 0.

Dividend = 584676. Excess = 0. The last two excesses are the same and the division is probably correct.

As mentioned under tests of addition, casting out the nines does not give an absolute test.

Short methods of division.

1. To divide a number by 10, 100, 1000, etc., point off as many places as there are zeros in the divisor. The number left will be the quotient and the number pointed off will be the remainder.

$$42861 \div 100 = 428 \text{ and } 61/100.$$

2. To divide by any number ending in zeros, point off as many places as there are zeros at the right of the number. Divide the number left by the divisor without the zeros. The quotient found will be the desired quotient. To get the remainder, annex the figures pointed off to the remainder left on dividing. This will be the desired remainder.

$$785436 \div 4000 = 785 \div 4 \text{ and } 436 = 196 \text{ and } 1436/4000.$$

3. To divide by 5, 50, 500, etc., multiply by 2 and divide by 10, 100, 1000, etc.

$$4856 \div 50 = 2 \times 4856 \div 100 = 97 \text{ and } 12/100.$$

4. To divide by 2.5, 25, 250, etc., multiply by 4 and divide by 10, 100, 1000, etc.

$$3728 \div 25 = 4 \times 3728 \div 100 = 149 \text{ and } 12/100.$$

For a further explanation of the special methods of multiplication and division, see multiplication and division of decimals and the section on aliquot parts.

FACTORING.

It is often necessary to determine the factors of a number. From the definition of a factor, it follows that *a number is exactly divisible by any of its factors.*

Factoring is the process of finding the factors of a number.

There are certain tests that make the work of factoring much simpler.

Tests of divisibility.

1. An even number is divisible by 2.

2. A number whose unit's figure is 0 or 5 is divisible by 5.

3. A number is divisible by 3 if the sum of its digits is divisible by three.

4. A number is divisible by 9 if the sum of its digits is divisible by 9.

Other tests are often given but like number 4, they are combinations of the first three.

To find the prime factors of a number, divide the number by its least prime factor, divide the quotient so found by its least prime factor, etc., till the last quotient so found is a prime number. The divisors and the last quotient are the prime factors of the number.

EXAMPLE. Factor 1428.

2)1428 By Test 1.
2)714 By Test 1.
3)357 By Test 3.
7)119 The next possible prime.
17 A prime number

The prime factors are 2, 2, 3, 7, and 17.

To find the greatest common factor of two or more numbers.

CASE 1. When the numbers can be factored easily.

Find the prime factors of each of the numbers. The product of all the factors common to all the numbers is the greatest common factor of the numbers.

This number is also called the *greatest common divisor* of the numbers. Written G. C. D.

EXAMPLE. Find the G. C. D. of 24, 60 and 210.

Factoring $24 = 2 \times 2 \times 2 \times 3$.
$60 = 2 \times 2 \times 3 \times 5$
$210 = 2 \times 3 \times 5 \times 7$
$\therefore$ G. C. F. $= 2 \times 3 = 6$.

CASE 2. When the factors are not immediately apparent.

Divide the greater by the smaller number. Divide the first divisor by the remainder. Repeat this process till a remainder is found that is contained evenly in the preceding divisor. This number is the required G. C. D. If the process continues till 1 is the remainder, the numbers are prime to each other.

EXAMPLE. Find the G. C. D. of 4656 and 10767.

4656) 10767 (2
9312
1455) 4656 (3
4365
291) 1455 (5
1455

$\therefore$ G. C. D. = 291.

If more than two numbers are given, find the G. C. D. of any two, then find the G. C. D. of this number and the third number, and so on.

To find the least common multiple of two or more numbers.

CASE 1. When the numbers can be factored readily.

First method. Find the prime factors of the numbers. The product formed by multiplying together all the prime factors, each factor being taken as many times as it occurs in any single number is the least common multiple. Written L. C. M.

EXAMPLE. Find the L. C. M. of 10, 15, and 24.

$10 = 2 \times 5$
$15 = 3 \times 5$
$24 = 2 \times 2 \times 2 \times 3$. L.C.M. $= 2 \times 2 \times 2 \times 3 \times 5 = 120$.

Second method. Arrange the numbers horizontally. Divide by any number common to two or more of the numbers. Bring down the quotients of all numbers divided, together with those numbers which are not divisible by the divisor being used. Continue in this manner until no two of the quotients have a common factor. The product of the divisors and last quotients is the L. C. M.

EXAMPLE. Find the L. C. M. of 10, 15, and 24.

2) 10 15 24
5) 5 15 12
3) 1 3 12
1 1 4

L. C. M. $= 2 \times 5 \times 3 \times 4 = 120$.

CASE 2. When the factors are not immediately apparent.

Find the G. C. D. of the numbers. Divide each number by the G. C. D. The product of these quotients and the G. C. D. is the L. C. M.

EXAMPLE. In the example under Case 2 for finding the G.C.D.,
$4656 \div 291 = 16$ and $10767 \div 291 = 37$.
L. C. M. $= 16 \times 37 \times 291 = 172272$

When there are only two numbers, it is not necessary to divide both numbers by the G. C. F. The L. C. M. may be found by multiplying one number by the quotient obtained by dividing the other number by the G. C. F.

In the above example, the L. C. M. $= 10767 \times 16 = 172272$.

The following statements may be readily verified.

1. In addition, multiplying or dividing each of the addends by a number, multiplies or divides the sum by the same number.

2. In subtraction, multiplying or dividing the minuend and subtrahend by a number, multiplies or divides the difference by the same number.

3. In multiplication, multiplying or dividing either the multiplier or multiplicand by a number, multiplies or divides the product by the same number.

4. In division, multiplying or dividing both the dividend and the divisor by the same number does not affect the quotient.

Other propositions of a similar nature can be verified without difficulty.

CANCELLATION.

The fourth proposition stated above furnishes a means of greatly shortening many computations.

Cancellation is the process of shortening computations in division by dividing out or cancelling equal factors from both dividend and divisor.

In cancellation, division is usually indicated by a horizontal line with the dividend written above and the divisor below it.

EXAMPLE. Divide $8 \times 24 \times 36 \times 50$ by $48 \times 75 \times 18$.

$$\frac{\overset{1}{\cancel{8}} \times \overset{4}{\cancel{24}} \times \overset{4}{\cancel{36}} \times \overset{2}{\cancel{50}}}{\underset{6}{\cancel{48}} \times \underset{3}{\cancel{75}} \times \underset{2}{\cancel{18}}} = \frac{16}{3} = 5 \text{ and } \frac{1}{3}$$

Cancel 8 from dividend and divisor, leaving 1 in place of 8 and 6 in place of 48. Cancel 6, leaving 4 in place of 24 and 1 in place of 6. Do not write the 1. Cancel 25, leaving 2 in place of 50 and 3 in place of 75. Cancel 9, leaving 4 in place of 36 and 2 in place of 18. Cancel 2. Multiply the factors in the dividend and divide by the product of the factors left in the divisor. This will give the required quotient and remainder.

In cancellation, many different plans can be followed. Smaller factors may be used, or if they are recognized, larger numbers may be cancelled. In the illustration, 18 could have been cancelled instead of 9. *Be sure and cancel the same factor in both dividend and divisor.*

FRACTIONS.

The second kind of number studied in arithmetic is called a *fraction.*

Anything that may be thought of as a whole may be considered as a unit.

A fraction is one or more of the equal parts of a unit.

A fraction is written by placing one number above and one below a horizontal line. One third $= \frac{1}{3}$, etc.

The *terms* of a fraction are the *numerator* and the *denominator.* The *numerator* is the number above the line. It indicates the number of parts of the unit taken. The *denominator* is the number below the line. It indicates into how many equal parts the unit is divided.

In the fraction $\frac{3}{4}$, the unit is divided into 4 equal parts and 3 of these parts are taken. The numerator is 3 and the denominator is 4. The fraction is read three fourths.

When two or more fractions have the same denominator, this denominator is called a *common denominator.* Fractions which have a common denominator are said to be *similar.*

The notation used in writing fractions suggests the idea of division. In fact, *a fraction is an expressed division.* The numerator of the fraction is to be divided by the denominator. The quotient of this division is the *value* of the fraction.

A *proper fraction* is a fraction whose value is less than 1; as $\frac{1}{2}$, $\frac{3}{4}$, $\frac{15}{16}$, etc.

An *improper fraction* is a fraction whose value is equal to or greater than 1; as $\frac{5}{5}$, $\frac{7}{4}$, $\frac{21}{16}$, etc.

A *mixed number* is a number composed of an integer and a fraction. Its value represents the sum of the integer and the fraction. Eg., $2\frac{3}{5}$, $15\frac{7}{16}$, etc.

REDUCTION OF FRACTIONS.

Reduction of fractions is the process of changing the terms of a fraction without altering its value. If the terms are increased, the fraction is reduced or raised to *higher* terms. If the terms are lessened, the fraction is reduced to *lower* terms.

A fraction is *raised to higher terms* by multiplying the numerator and denominator by the same number. From the laws of division it follows that this does not alter the value of the fraction.

EXAMPLE. $\frac{3}{4} = \frac{3}{4} \times \frac{6}{6} = \frac{18}{24}$.

A fraction is *reduced to lower terms* by dividing the numerator and denominator by the same number. This does not alter the value of the fraction.

EXAMPLE. $\frac{6}{8} = \frac{6 \div 2}{8 \div 2} = \frac{3}{4}$.

A fraction is *reduced to its lowest terms,* when the numerator and denominator have no common factor.

To reduce a fraction to its lowest terms, divide the numerator and denominator by their greatest common factor.

EXAMPLE. Reduce $\frac{24}{36}$ to its lowest terms.

$$\frac{\cancel{24}^{\,2}}{\cancel{36}_{\,3}} = \frac{2}{3}$$

Or,

G. C. D. of 24 and 36 = 12.

$$\frac{24 \div 12}{36 \div 12} = \frac{2}{3}.$$

Use the method of cancellation to take out common factors or find the G. C. F. and divide both terms by it.

To change a mixed number into an improper fraction. Any integer may be thought of as a fraction with the denominator 1. Reduce the integral part of the mixed number to a fraction with the same denominator as the fractional part by multiplying the numerator of 1 by the denominator of the fraction. Add the numerator so found to the numerator of the fractional part of the number.

EXAMPLE. Change $15\frac{7}{8}$ to an improper fraction.

$$15 = \frac{15}{1} = \frac{15 \times 8}{1 \times 8} = \frac{120}{8}$$

$$15\frac{7}{8} = \frac{120}{8} + \frac{7}{8} = \frac{127}{8}.$$

To change an improper fraction into a mixed number. Divide the numerator by the denominator. The quotient will be the integral part, and the remainder will be the numerator of the fractional part of the mixed number.

To reduce two or more fractions to similar fractions. Find a common multiple of the denominators and reduce each fraction to a fraction having this common multiple as its denominator. The case usually met with in practice is the following.

To reduce two or more fractions to their least common denominator. The least common denominator of two or more fractions is the least common multiple of their denominators.

Find the L. C. M. of the denominators. Reduce each fraction to a fraction having this L. C. M. as the new denominator.

EXAMPLE. Change to similar fractions having a least common denominator, $\frac{3}{7}, \frac{11}{14}, \frac{19}{28}$.

The L. C. M. of the denominators is 28.

$$\frac{3}{7} = \frac{3 \times 4}{7 \times 4} = \frac{12}{28}.$$

$$\frac{11}{14} = \frac{11 \times 2}{14 \times 2} = \frac{22}{28}.$$

$$\frac{19}{28} = \frac{19}{28}.$$

ADDITION OF FRACTIONS.

CASE 1. SIMILAR FRACTIONS.

Add the numerators and place the sum over the common denominator.

EXAMPLE. $\frac{3}{16} + \frac{7}{16} + \frac{11}{16} = \frac{3 + 7 + 11}{16}$

$= \frac{21}{16} = 1\frac{5}{16}.$

When the answer is an improper fraction, it is customary to reduce it to a mixed number.

CASE 2. FRACTIONS HAVING DIFFERENT DENOMINATORS.

Only like numbers can be added. In fractions, this means that only like parts of units can be added. If the parts are not the same, they must be expressed in terms of other parts which are. The rule follows.

Make the fractions similar by reducing them to fractions whose denominators are the L. C. M. of the given denominators. Add the resulting numerators and place the sum over the L. C. M.

EXAMPLE. $\frac{1}{3} + \frac{3}{10} + \frac{11}{15} = \frac{10}{30} + \frac{9}{30} + \frac{22}{30}$

$= \frac{10 + 9 + 22}{30}$

$= \frac{41}{30} = 1\frac{11}{30}.$

CASE 3. MIXED NUMBERS.

Add the fractional parts of the mixed numbers as explained in cases 1 and 2. Add this sum to the sum of the integral parts of the numbers.

EXAMPLE. Add $23\frac{2}{9}$, $36\frac{11}{15}$, and $50\frac{8}{45}$.

Add the fractions first.

$\frac{2}{9} + \frac{11}{15} + \frac{8}{45} = \frac{10 + 33 + 8}{45}$

$= \frac{51}{45} = 1\frac{6}{45} = 1\frac{2}{15}.$

$23 + 36 + 50 + 1\frac{2}{15} = 110\frac{2}{15}.$

$23\frac{2}{9}$

$36\frac{11}{15}$

$50\frac{8}{45}$

$110\frac{2}{15}$

Addition of mixed numbers is usually performed by placing the integral parts above each other as in addition of integers. The student should learn to add small fraction mentally and as readily as he adds integers. In many problems the reduction to a common denominator and the adding of the numerators can be carried out in this way with great saving in time. In the illustration, the fractions add to give $1\frac{2}{15}$. The whole part of this number, the 1, is carried to the digits column and added with the integers.

SUBTRACTION OF FRACTIONS.

In subtraction, as in addition, only like numbers can be subtracted. Hence if the fractions are not similar they must be reduced to a common denominator. Subtract the resulting numerators and place the difference over the common denominator.

In the case of mixed numbers, the fractions are subtracted and then the integers. It may be necessary to borrow 1 from the units place in order to make the fraction in the minuend greater than the fraction in the subtrahend. In this case the fraction in the minuend will be an improper fraction.

EXAMPLE. Subtract $54\frac{9}{15}$ from $82\frac{4}{9}$.

$82\frac{4}{9}$ Reducing $\frac{4}{9}$ and $\frac{9}{15}$ to their L. C. D.,

$54\frac{9}{15}$ gives $\frac{20}{45}$ and $\frac{27}{45}$. Since $\frac{20}{45}$ is the smaller

$27\frac{38}{45}$ number it is necessary to borrow 1 from 82 leaving 81 and adding $1 = \frac{45}{45}$ to $\frac{20}{45}$. This gives $\frac{65}{45} - \frac{27}{45} = \frac{38}{45}$. 4 from 11 leaves 7; 6 from 8 leaves 2

MULTIPLICATION OF FRACTIONS.

CASE 1. A FRACTION AND AN INTEGER.

Multiply the numerator of the fraction by the integer and place the product over the denominator. Reduce this fraction to its lowest terms.

EXAMPLE. Multiply $\frac{5}{12}$ by 14.

$\frac{5}{12} \times 14 = \frac{5 \times \cancel{14}^{7}}{\cancel{12}_{6}} = \frac{5 \times 7}{6} = \frac{35}{6} = 5\frac{5}{6}.$

In multiplication, the multiplier and multiplicand may be interchanged without changing the product. Hence, the multiplication of a fraction by an integer is the same as multiplying an integer by a fraction. This principle is called the *commutative law* for numbers.

CASE 2. TWO OR MORE FRACTIONS.

Multiply the numerators for the new numerator and multiply the denominators for the new denominator. Reduce the result to its lowest terms.

In multiplying fractions, cancel factors common to both numerator and denominator before multiplying when possible.

EXAMPLE. Multiply $\frac{21}{32}$ by $\frac{12}{35}$.

$\frac{21}{32} \times \frac{12}{35} = \frac{\cancel{21}^{3} \times \cancel{12}^{3}}{\cancel{32}_{8} \times \cancel{35}_{5}} = \frac{9}{40}.$

In multiplying fractions, the sign × is read *times* or *of*; for example, $\frac{1}{2} \times \frac{3}{4}$ is read one half *times* two thirds or one half *of* two thirds.

CASE 3. MIXED NUMBERS.

I. To multiply a mixed number by an integer, multiply each part of the mixed number by the integer and add the results. Reduce to lowest terms.

EXAMPLE. $9 \times 26\frac{5}{6} = 9 \times 26 + 9 \times \frac{5}{6}.$

$= 234 + \frac{\overset{3}{\cancel{9}} \times 5}{\underset{2}{\cancel{6}}}$

$$= 234 + \frac{15}{2} = 234 + 7\frac{1}{2}$$

$$= 241\frac{1}{2}.$$

II. **To multiply a mixed number by a fraction,** multiply each part of the mixed number by the fraction and add the results. Reduce to lowest terms.

EXAMPLE. $\frac{3}{4}$ of $14\frac{2}{9}$.

$$\frac{3}{\cancel{4}_{2}} \text{ of } \frac{\cancel{14}^{7}}{\cancel{9}_{3}} = \frac{21}{2}; \quad \frac{\cancel{3}}{\cancel{4}_{2}} \text{ of } \frac{\cancel{2}}{\cancel{9}_{3}} = \frac{1}{6}.$$

$$\frac{21}{2} + \frac{1}{6} = \frac{64}{6} = 10\frac{2}{3}.$$

III. **To multiply two mixed numbers.**

First method. Reduce the mixed numbers to improper fractions, multiply the numerators for the new numerator and the denominators for the new denominator, reduce to lowest terms.

EXAMPLE. $7\frac{1}{4} \times 11\frac{3}{7}$.

$$7\frac{1}{4} = \frac{29}{4}, 11\frac{3}{7} = \frac{80}{7}$$

$$\frac{29}{4} \times \frac{\cancel{80}^{20}}{7} = \frac{580}{7} = 82\frac{6}{7}.$$

Second method. When the integers in the mixed numbers are large it is often more convenient to perform the multiplication by the four step method. The following example will illustrate the rule.

EXAMPLE. Multiply $456\frac{3}{4}$ by $87\frac{2}{9}$.

$456\frac{3}{4}$

$87\frac{2}{9}$

$\frac{1}{6}$ First step. $\frac{\cancel{2}}{\cancel{9}_{3}} \times \frac{\cancel{3}}{\cancel{4}_{2}} = \frac{1}{6}$.

$101\frac{1}{3}$ Second step. $\cancel{456}^{152} \times \frac{2}{\cancel{9}_{3}} = \frac{304}{3} = 101\frac{1}{3}$.

$65\frac{1}{4}$ Third step. $87 \times \frac{3}{4} = \frac{261}{4} = 65\frac{1}{4}$.

3192 Fourth step. 87×456.
3648

$39838\frac{3}{4}$ Answer.

The four steps are as follows:

First step. Multiply the fractions.

Second step. Multiply the integer in the multiplicand by the fraction in the multiplier.

Third step. Multiply the integer in the multiplier by the fraction in the multiplicand.

Fourth step. Multiply the two integers.

Add these four products to obtain the required product.

It should be noticed that the method in case 2 for multiplying two fractions is the general rule. If one regards an integer as a fraction whose denominator is 1, case 1 and case 3 and even the multiplication of integers are covered by this rule. This is true for the rules for all the fundamental operations as worked out for fractions. They are a more general statement of the rules for integers.

DIVISION OF FRACTIONS.

Dividing the numerator of a fraction by a number, divides the value of the fraction by that number.

Multiplying the denominator of a fraction by a number, divides the fraction by that number.

These principles will be recognized as true from a consideration of the meaning of fractions. They are used in the process of division of fractions.

CASE 1. DIVIDING A FRACTION BY AN INTEGER.

Divide the numerator by the integer if it goes evenly and place the quotient over the denominator. Or multiply the denominator by the number and place the product under the original numerator.

EXAMPLE. $\frac{14}{15} \div 7 = \frac{14 \div 7}{15} = \frac{2}{15}$.

Or $\frac{14}{15} \div 7 = \frac{1}{\cancel{7}} \text{ of } \frac{\cancel{14}^{2}}{15} = \frac{2}{15}$.

CASE 2. TO DIVIDE ANY NUMBER BY A FRACTION OR MIXED NUMBER.

First method. Reduce both numbers to fractions having a common denominator. The quotient of the numerators will be the required number.

EXAMPLE. Divide $61\frac{1}{4}$ by $7\frac{7}{8}$.

L. C. D. is 8.

$$61\frac{1}{4} = \frac{490}{8}; 7\frac{7}{8} = \frac{63}{8}$$

$$63)490(7\frac{7}{9} \text{ Ans.}$$
$$441$$
$$\frac{49}{63} = \frac{7}{9}.$$

Second method. Reduce both numbers to fractional form, invert the divisor and multiply. Use cancellation whenever possible.

EXAMPLE. Divide $43\frac{3}{4}$ by $7\frac{7}{8}$.

$$43\frac{3}{4} = \frac{175}{4} \text{ and } 7\frac{7}{8} = \frac{63}{8}.$$

$$\frac{175}{4} \div \frac{63}{8} = \frac{\overset{25}{\cancel{175}}}{\cancel{4}} \times \frac{\cancel{8}^{2}}{\cancel{63}_{9}}$$

$$= \frac{50}{9} = 5\frac{5}{9}.$$

COMPLEX FRACTIONS.

A *complex fraction* is a fraction which has mixed or complex numbers in either the numerator or denominator or both.

To find the value of a complex fraction, reduce the numerator and denominator to fractional form, and multiply the numerator by the inverse of the denominator.

EXAMPLE.

$$\frac{12\frac{1}{2} + 3\frac{1}{3}}{10\frac{5}{6}} = \frac{\frac{95}{6}}{\frac{65}{6}} = \frac{\overset{19}{\cancel{95}}}{\cancel{6}} \times \frac{\cancel{6}}{\cancel{65}_{13}} = \frac{19}{13} = 1\frac{6}{13}$$

DECIMALS.

In actual experience with practical problems, fractions with denominators greater than 32 are seldom encountered. When fractions with larger denominators do occur, they are usually all reduced to fractions having some power of ten as a denominator. By a power of ten is meant 10, $10 \times 10 = 100$, $10 \times 10 \times 10 = 1000$, etc. The number of times ten is taken is indicated by a number called the exponent. Using this notation, $1000 = 10^3$.

Fractions whose denominators are powers of ten are called *decimal fractions or decimals.* They are written in a special way. The denominator is not expressed, the number of tens in it being indicated by the number of figures to the right of a dot called the *decimal point.* The integral part of a mixed number is written to the left of the decimal point and the fractional or decimal part is written to the right. As in the case of integers, the places to the right of the decimal point are named to enable them to be read easily.

The names assigned to each place are indicated in the accompanying chart.

Millions	Hundred Thousands	Ten Thousands	Thousands	Hundreds	Tens	Units	Decimal Point	Tenths	Hundredths	Thousandths	Ten Thousandths	Hundred Thousandths	Millionths	Ten Millionths	Hundred Millionths
3,	7	2	4,	1	9	0	.	1	0	7	2	9	3	1	4

Additional places to the right are named in a manner similar to that indicated in the notation and numeration of integers.

In reading a mixed decimal, the word and is used between the integral and fractional part of the number.

The above number is read: 3 million, 7 hundred 24 thousand, 1 hundred 90 *and* 10 million, 7 hundred 29 thousand, 3 hundred 14 hundred millionths.

Zeros between the decimal point and the first significant figure of the decimal do not affect the reading of the numerator of the decimal but they are counted in determining the number of zeros in the denominator. That is, .00143 is read 1 hundred 43 hundred thousandths.

A most important property of decimals is the ease with which decimals can be reduced to a common denominator. All that is required is to add zeros to the right of any of the numbers till all have the same number of figures to the right of the decimal point.

Because of this, addition and subtraction of decimal fractions is accomplished more easily than in the case of common fractions.

ADDITION OF DECIMALS.

To add decimals, set the numbers down so that the decimal points are directly under each other and add as in integers, the decimal point in the sum being placed directly below the other decimal points.

It is not necessary to add zeros at the right unless they are needed to help one to keep figures of like value under each other. It is important that the columns be kept straight.

The most common application of decimal fractions in the United States is in handling money. The unit in our money is One Dollar, written \$1.00. One tenth of a dollar is written \$.10. One one hundredth of a dollar or one cent is written \$.01.

EXAMPLES Add

\$ 5,095.76	28.9014
9,172.85	316.4823
8,763.76	7.92
\$23,032.37	18.015
	240.2
	611.5187

SUBTRACTION OF DECIMALS.

To subtract decimals, set the numbers down so that the decimal points are directly under each other and subtract as for integers, placing the decimal point in the difference directly below the other decimal points.

If there are more places to the right of the decimal point in the subtrahend than in the minuend, zeros are added to the minuend to make up the number.

EXAMPLES.

\$11,007.91	91.42600
7,892.83	37.02846
\$ 3,115.08	54.39754

MULTIPLICATION OF DECIMALS.

To multiply decimals, multiply the numbers exactly as if they were integers. Place the decimal point so that the number of decimal places in the product is equal to the sum of the decimal places in the numbers.

EXAMPLE. Multiply 41.08 by .093

```
  41.08
    .093
 -------
  12324
 36972
 -------
 3.82044
```

Short methods of multiplication.

1. To multiply by 10, 100, 1000, etc., move the decimal point one, two, three, etc., places to the right in the number.

EXAMPLE. $42.831 \times 100 = 4283.1$.

2. To multiply by 5, 50, 500, etc., move the decimal point one, two, three, etc., places to the right and divide the number by 2.

EXAMPLE. $37.423 \times 5 = 374.23 \div 2 = 187.165$.

3. To multiply a number by 2.5, 25, 250, etc., move the decimal point one, two, three, etc., places to the right and divide the number by 4.

EXAMPLE. $9.928 \times 250 = 9928. \div 4 = 2482$.

In multiplying decimals, it is a good plan to estimate the result mentally before multiplying. This will often furnish a valuable check on the position of the decimal point. To estimate a result, multiply the first significant figures of the numbers.

In the above example, $9 \times 200 = 1800$ and the answer will be larger than this number.

In multiplying two decimals, the number of places in the product is often more than is needed in practical problems. In fact, the data involved in the problem are often such that decimals after the first or second place are meaningless. For this reason, it is important to know what degree of accuracy is necessary or desirable in a problem. In measuring a farm, an error of .001 of an acre would not bother much. In this case, all figures after the third place may be dropped and the answer "rounded off" by taking the number to three places that is nearest to the number obtained. In case the product lies exactly between them, a good rule is to take the nearest even number.

Abbreviated multiplication. This rounding off process can be performed in connection with a form of multiplication known as abbreviated multiplication. An illustration will serve best to explain the method. The solution is shown in three ways, by the regular method, with the multiplier reversed, and with the partial products rounded off in each step.

Regular method

```
    41.26
    3.1416
 ---------
    24756
     4126
   16504
    4126
12378
 ---------
129.622416
```

Reversed method

```
    41.26
61416.3
 ---------
123786
   4126
  16504
     4126
    24756
 ---------
129.622416
```

Abbreviated method

```
    * * * *
    41.26
61416.3
 ---------
123.78   Locate dec. pt. in 1st partial product.
   413   Round off 4126, getting 413.
   165   Round off 16504.
     4
     2
 ---------
129.62
```

After multiplying by 3, place the decimal point and decide how many decimal points are wanted in the answer. Check the figure in the multiplicand which is multiplied by 3 to get the last number to be kept. In multiplying by the next digit, 1, multiply the starred number mentally, i.e. 6. This being greater than 5, 1 is carried and the multiplication goes on regularly. Again star the first number whose product by 1 was kept and in multiplying by the next digit do not write its product. 4×2 is 8 so carry 1. In the next multiplication, 1×1 is 1 and this number is dropped. In the last multiplication, the 4 is already starred. 6×4 is 24. The 4 is dropped and only the 2 is carried. There is nothing to go with it, so it is written in the right hand column.

In case the product of a starred number ends in 5, carry it as 1 if the preceeding number is odd and drop it if the preceeding number is even.

In the above problem, the answer is not apt to be correct to more than two decimal places since the multiplicand is given to only two places. The answer when rounded off is the same by the regular method as by the abbreviated method. It will sometimes vary in the last figure, but the result will be as satisfactory for practical purposes, as that obtained by the longer method.

DIVISION OF DECIMALS.

To divide decimals, divide the numbers exactly as if they were integers. There are several ways that are used in determining where the decimal point is to be placed in the quotient.

First method. Multiply the dividend and divisor by that power of ten which will make the divisor a whole number. This is done by moving the decimal point in the divisor and dividend as many places to the right as there are decimal places in the divisor. Divide the numbers as in the case of integers, placing the decimal point in the quotient directly above (in the case of short division, below) the new decimal point in the dividend.

EXAMPLE. Divide 4.2 3 1 6 by .0 0 8.
Move decimal point three places to the right.

```
  528.95
8)4231.60
```

Division may be continued indefinitely or until there is no remainder by adding zeros to the right of the last significant figure in the dividend.

EXAMPLE. Divide 2 5 0 0.6 by 7 5.4 3.
Move decimal point two places to the right.

```
          33.15
      ------------
7543)250060.00
     22629
     ------
      23770
      22629
      -----
       11410   Rem. = 955/7543 thousandths.
        7543
        ----
        38670
        37715
        -----
          955
```

In division of decimals it is customary to round off the remainder, taking the nearest number after the desired amount of accuracy has been reached. If the numbers in this example represented dollars and cents, the remainder would have no meaning in money and would be "dropped."

Second method. This method is based on the same principles as the first but it does not require the actual moving of the decimal points.

Instead, the first figure of the quotient is written as many places to the left of its normal position as there are decimal places in the divisor. The decimal point in the quotient is placed directly above the decimal point in the dividend.

EXAMPLE Divide 2.0 4 by .6 2 5.

```
          3.2 6 4
        ------------
.6 2 5 ) 2.0 4 0 0 0 0
         1 8 7 5
         -------
           1 6 5 0
           1 2 5 0
           -------
             4 0 0 0
             3 7 5 0
             -------
               2 5 0 0
               2 5 0 0
               -------
```

The natural place for the first figure of the quotient to be written is above the first zero after the 4 in the dividend. Counting three places to the left, it is written above the 2.

Third Method. Divide without regard to decimal points, and when the division is completed, point off as many places in the quotient as the number of decimal places used in the dividend is greater than the number of decimal places in the divisor. In this method, zeros added to the dividend to continue the division are counted as places in the dividend.

While the last method is probably more used than any of the others, many teachers prefer to use the first method in presenting the subject to their pupils for the first time.

In practice, it is cutomary to indicate in the dividend by a caret (∧) or some other mark, the same number of decimal places in the dividend as are present in the divisor, placing the decimal point in the quotient after the last number to the left of the caret has been used.

EXAMPLE. Divide 4 5.2 6 by 7.5 2 1.

```
                6.0 1 7 8
              ------------
7.5 2 1 ) 4 5.2 6 0∧0 0 0 0
          4 5 1 2 6
          ---------
            1 3 4 0 0
              7 5 2 1
              -------
              5 8 7 9 0
              5 2 6 4 7
              ---------
                6 1 4 3 0
                6 0 1 6 8
                ---------
                  1 2 6 2
```

Remainder = $\frac{1262}{7521}$ hundred thousandths.

The quotient can be rounded off by dropping the remainder or it may be written, $6.0178\frac{1262}{7521}$.

A quotient that has been rounded off is an *incomplete or approximate decimal.* If the remainder is dropped in the process, the sign + is added; eg., 6.0178 +. If, in the process, the next higher number is taken, the sign − is added; eg., rounding off the above after the second decimal gives 6.02−.

If the remainder is written as a part of the quotient the number is a *complex decimal.*

Short methods of division.

1. To divide by 10, 100, 1000, etc., move the decimal point, one, two, three, etc., places to the left in the number.

Other special rules can be stated similar to those in the work on multiplication.

Abbreviated Division. The work of division can often be greatly shortened when the degree of accuracy desired has been determined. By this method, the last example worked above would appear as follows.

Regular form

```
                6.0 1 7 8
              ------------
7.5 2 1 ) 4 5.2 6 0 0 0 0 0
          4 5 1 2 6
          ---------
            1 3 4 0 0 0
              7 5 2 1
              -------
              5 8 7 9 0 0
              5 2 6 4 7
              ---------
                6 1 4 3 0
                6 0 1 6 8
                ---------
                  1 2 6 2
```

Abbreviated form

```
                * * *
                6.0 1 7 8
              ------------
7.5 2 1 ) 4 5.2 6 0 0 0
          4 5 1 2 6
          ---------
            1 3 4 0 0
              7 5 2 1
              -------
              5 8 8 8
              5 2 6 4
              -------
                6 2 3
                6 0 1
                -----
                  2
```

All numbers are rounded off at a line under the desired number of decimal places in the quotient.

If the answer is desired to only two places, the work would appear as follows.

```
                  6 0 1
                * * *
              ------------
7.5 2 1 ) 4 5.2 6 | 7 8
          4 5 1 3 |
          -------
            1 3   |
              7   |
              ----
              6
```

The remainder is 6/7, and makes the quotient 6.02.

A mark is placed over the numbers in the divisor that are not used in the first partial division. After each division, one of the remaining numbers is checked. If it is desired to have a number correct to two places, round it off in the third place.

With practice, this method may be used to great advantage and is quite as accurate as the tables that are used to aid in work of this kind.

REDUCTION OF A FRACTION TO A DECIMAL.

To reduce a common fraction to a decimal, perform the indicated division, adding as many zeros to the numerator as may be needed.

EXAMPLE. Reduce $\frac{3}{8}$ to decimal form.

Divide 3 by 8: 8) 3.0 0 0

.3 7 5

Hence, $\frac{3}{8} = .375$.

Fractions are reduced to decimals to simplify many problems. When it is decided by the nature of the problem that a certain degree of accuracy is sufficient, the decimals express the values of several fractions in a satisfactory manner, stopping the division when this degree of accuracy is obtained.

The magnitude of fractions can be compared more readily when the fractions are in decimal form.

EXAMPLE. Which is the greater number, $\frac{7}{15}$ or $\frac{15}{31}$?

```
        .4 6 +                    .4 8 +
      ----------                ----------
15 ) 7.0 0              31 ) 1 5.0 0
     6 0                     1 2 4
     -----                   -----
       1 0 0                   2 6 0
         9 0                   2 4 8
         -----                 -----
           1 0                     1 2
```

Hence, $\frac{15}{31}$ is the greater number.

Any decimal may be written as a common fraction by writing the number without the decimal point as the numerator and 1 followed by as many zeros as there are places to the right of the decimal point in the given number.

EXAMPLE. $.2\,1\,6 = \frac{216}{1000} = \frac{27}{125}$.

ALIQUOT PARTS.

An *aliquot part* of a number is any part of the number which is contained an integral number of times in the given number.

By the use of aliquot parts, the work of multiplication and division by certain numbers is made much easier and the work can be performed much more rapidly. Some of the short methods of multiplication and division are based upon the methods of aliquot parts. For example, 25 is an aliquot part of 100, and to multiply by 25 multiply by 100 and divide by 4, i.e., number of times 25 is contained in 100.

Prices are very often fixed at aliquot parts of one dollar. This is equivalent to a certain number of units for one dollar, and makes it possible for the salesman to tell the price of any number of units very quickly.

Tables of aliquot parts are often furnished in stores and offices. In these cases, the number used is one dollar or 100 cents.

Below is a list of the more important aliquot parts of 100. In the first row, how many such parts there are in 100 is shown by the denominator of the fractions. The second row of the table shows the value of the aliquot parts.

ALIQUOT PARTS OF 100.

$\frac{1}{2}$	$\frac{1}{3}$	$\frac{1}{4}$	$\frac{1}{5}$	$\frac{1}{6}$	$\frac{1}{7}$	$\frac{1}{8}$	$\frac{1}{9}$	$\frac{1}{10}$	$\frac{1}{11}$	$\frac{1}{12}$	$\frac{1}{13}$	$\frac{1}{14}$	$\frac{1}{15}$	$\frac{1}{16}$	$\frac{1}{20}$	$\frac{1}{25}$	$\frac{1}{30}$	$\frac{1}{40}$	$\frac{1}{50}$
50	$33\frac{1}{3}$	25	20	$16\frac{2}{3}$	$14\frac{2}{7}$	$12\frac{1}{2}$	$11\frac{1}{9}$	10	$9\frac{1}{11}$	$8\frac{1}{3}$	$7\frac{9}{13}$	$7\frac{1}{7}$	$6\frac{2}{3}$	$6\frac{1}{4}$	5	4	$3\frac{1}{3}$	$2\frac{1}{2}$	2

There are other aliquot parts of 100 but these include all that are commonly met with in business.

To multiply and divide by aliquot parts of 100.

Multiplication. Multiply by 100 and divide by the number of times the aliquot part is contained in 100.

EXAMPLE. $54 \times 33\frac{1}{3} = \frac{5400}{3} = 1809$.

Division. Divide by 100 and multiply by the number of times the aliquot part is contained in 100.

EXAMPLE. $39420 \div 16\frac{2}{3} = \frac{39420}{100} \times 6$

$= 394.20 \times 6$

$= 2365.20$.

Multiples of aliquot parts may be used in a similar manner by using as many times 100 as the aliquot part is taken.

EXAMPLE. Multiply 14.28 by $37\frac{1}{2}$.

$37\frac{1}{2} = \frac{3}{8}$ of 100, hence multiply by 300 and divide by 8.

$\frac{14.28 \times 300}{8} = \frac{4284.00}{8} = 535.50$.

EXAMPLE. Divide 698.60 by $83\frac{1}{3}$.

$83\frac{1}{3} = \frac{5}{6}$ of 100, hence divide by 500 and multiply by 6.

$\frac{698.60}{500} \times 6 = \frac{4191.60}{500} = 8.3832$.

Combinations of aliquot parts. It is often possible to consider a number as the sum of two aliquot parts of a number or as the sum or difference of the number and an aliquot part of the number. Practice will develop skill and suggest many new methods. The pupil should endeavor to perform as much of the computation mentally as possible. The time spent in drill will save a great deal of work at a later period. Practice with the simpler aliquot parts first. A few additional examples will be suggestive.

EXAMPLE. $920 \times 7\frac{1}{2}$.

$7\frac{1}{2}$ is $\frac{3}{40}$ of 100.

Hence, $\frac{\overset{23}{\cancel{920}} \times 3 \times 100}{\underset{40}{\cancel{40}}} = 6900$.

EXAMPLE. $3090 \times 23\frac{1}{3}$.

$23\frac{1}{3} = 20 + 3\frac{1}{3} = \frac{1}{5}$ of $100 + \frac{1}{30}$ of 100

Hence, $\frac{3090 \times 100}{5} + \frac{3090 \times 100}{30} = 61800 + 10300$

$= 72100$

EXAMPLE. $1280 \times 133\frac{1}{3}$.

$133\frac{1}{3} = 100 + \frac{1}{3}$ of 100

Hence, $1280 \times 100 + \frac{1280 \times 100}{3} = 128000 + 42666\frac{2}{3}$

$= 170666\frac{2}{3}$.

EXAMPLE. $640 \times 87\frac{1}{2}$.

$87\frac{1}{2} = 100 - 12\frac{1}{2} = 100 - \frac{1}{8}$ of 100.

Hence, $640 \times 100 - \frac{\overset{80}{\cancel{640}} \times 100}{\underset{8}{\cancel{8}}} = 64000 - 8000$

$= 56000$.

DENOMINATE NUMBERS.

Measurement. Measurement is always a comparison of the thing being measured with something else of the same kind. For purposes of convenience, the elements that are used for comparison are fixed by law or custom. They are called the *units of measure*.

From these fundamental units, other elements are derived to facilitate the measurement of magnitudes of different sizes. The relation between different units of the same kind are set forth in what are called *tables of denominate numbers*.

A *denominate number* is a unit of measure whose value has been fixed by custom or by law.

Tables of denominate numbers are given in the Dictionary of Weights and Measures.

The kinds of denominate numbers depend upon the nature of the quantity to be measured.

There are two systems of denominate numbers that are in general use. One is *the English system* and the other is *the metric system.*

The fundamental unit of *length* in the English system is the foot. The inch, the yard, the mile and other linear units are derived from this. (See Long Measure.) The fundamental unit in the metric system is the *meter.* In the metric system only decimal parts of the meter are used as the millimeter, centimeter, decimeter, decameter, hectometer, and kilometer.

In measuring area, a square is used each side of which is equal to the unit of length. In the English system, the units are the square foot, square inch, square mile, etc. In the metric system, they are the square meter, the square centimeter, and the area which is equal to 100 square meters.

In measuring volume, a cube is used each side of which is equal to the unit of length. In the English system, the units are the cubic foot, the cubic inch, and the cubic yard. In the metric system, they are the cubic meter, the cubic decimeter and the cubic centimeter, etc.

In each of these cases there are other units that are sometimes used. The ones named are the more common ones.

In measuring *capacity,* the English system has one set of units for liquids and another for dry substances as grain, vegetables, etc. The unit of liquid measure is the *gallon.* (See gallon. Also, liquid measure.) The unit of dry measure is the *bushel.* (See bushel. Also, dry measure.) The unit of measure for capacity in the metric system is the *liter.*

In measuring *weight,* four kinds of units are in common use. 1. *Troy weight,* used in weighing gold, diamonds, and other precious minerals. (See grain, pennyweight, ounce, and pound.) 2. *Apothecaries weight,* used by druggists in preparing medicines. (See grain, scruple, dram, ounce, and pound.) 3. *Avoirdupois weight,* used to weigh all kinds of heavy articles. (See ounce, pound, and ton.) 4. The *metric system,* used almost entirely in scientific work and increasingly in general work. (See gram, kilogram, and quintal.)

Time is the measure of duration.

The unit of time is the second. (See time.)

Reduction of denominate numbers consists in changing the units of measure of a number without changing its value. A denominate number may be reduced from a lower to a higher or from a higher to a lower denomination.

The work of reducing or combining denominate numbers is of such a simple nature that no particular solution will be given for it. The principles are developed in the sections dealing with arithmetic in the third and fourth grades.

INVOLUTION AND EVOLUTION.

Involution.

The *power* of a number is the product obtained by multiplying the number by itself a certain number of times. If the number is multiplied by itself, the product is the *second* power of the number. If this product is multiplied again by the number, the resulting product is the *third* power of the number, and so on.

An *exponent* is a small number placed to the right and above the number to indicate the power of the number, i. e. the number of times the number is to be used as a factor.

The second power of 4 is written 4^2, and is equal to $4 \times 4 = 16$.

Similarly, $15^3 = 15 \times 15 \times 15 = 3375$.

$1.4^4 = 1.4 \times 1.4 \times 1.4 \times 1.4 = 3.8416$.

The process of finding the power of a number is called *involution.*

Evolution.

The *root* of a number is that number which multiplied by itself one or more times as a constant factor gives the number.

The square root of a number is that number which used twice as a factor will give the number.

The cube root of a number is that number which used three times as a factor will give the number.

Higher roots are defined in the same manner.

The root of a number is commonly indicated by the *radical sign,* $\sqrt{\ }$. Which root is meant is indicated by placing a small number just above and to the left of the radical sign. This number is called the *index.*

The square root of 16 is written $\sqrt{16} = 4$. The index is not written for square roots.

Similarly, $\sqrt[3]{125} = 5$.

$\sqrt[6]{64} = 2$.

It is not always possible to find the exact root of a number. The methods below will give the result to any desired degree of accuracy by carrying the operation on for additional steps. The nature of the problem will usually determine how much accuracy is desirable.

Any number of two digits may be thought of as the sum of the tens and units of the number. Actual trial with different numbers will convince one of the truth of the following statement.

The square of any number of two digits is equal to the square of the tens plus twice the product of the tens by the units plus the square of the units.

The rule for finding the square root of any number is based upon the above principle.

To find the square root of any number.

Beginning at the decimal point, point off the number into periods of two figures each.

Determine the largest perfect square in the left hand period. Write its root as the first figure of the required root. Subtract its square from the first period and bring down the second period with the remainder.

Use twice the root already found as a trial divisor. A zero is added to the trial divisor to make allowance for the next number in the root. Divide the remainder by this divisor, writing the quotient as the next number of the root. Add this number to the trial divisor. Multiply

this sum by the number in the root just found and subtract the product from the remainder. If the product is too large, try a smaller number in the root. Bring down the next period and proceed as above till all the periods have been used or, in the case of decimals, till the desired degree of accuracy has been reached.

There will be as many places to the left of the decimal point in the root as there are periods to the left of the decimal point in the number.

EXAMPLE. Find the square root of 265.294.

```
          *   *   *   *
        2 6 5.2 9 4 0   ( 1 6.2 8
        1
      -----
2 0 |   1 6 5
    6
  -----
2 6 |   1 5 6
      -------
    3 2 0 | 9 2 9
        2 |
      -------
    3 2 2 | 6 4 4
          -------
  3 2 4 0 | 2 8 5 4 0
        8 |
      -------
  3 2 4 8 | 2 5 9 8 4
          -----------
                2 5 5 6
```

If it is desired to continue the process, a period of two zeros would have to be added to the right of the number. This can be repeated indefinitely.

In the example, the first trial divisor, 20, is contained 8 times in the remainder, 165. But when 8 is added to 20 and the sum multiplied by 8 the product is too large. The same is true for 7. Hence 6 is used as the second number of the root.

The last period to the right of the decimal point is completed by the addition of a zero.

To find the cube root of a number.

Beginning at the decimal point, point off the number into periods of three figures each.

Determine the largest perfect cube in the first period. Write its root as the first figure of the required root. Subtract its cube from the first period and bring down the next period with the remainder.

The trial divisor is formed by taking three times the square of the root already found. Two zeros are added to make allowance for the next figure in the root. Divide the remainder by this divisor, writing the quotient as the next number in the root.

To the trial divisor, add three times the product of the first part of the root with a zero attached by the last number of the root plus the square of the last number. This sum is the complete trial divisor.

Multiply it by the last number of the root and subtract from the preceding remainder. If the product so found is too large, a smaller number must be used in the root.

Bring down the next period and repeat the process.

In pointing off the root, allow one place for every period in the number.

EXAMPLE. Find the cube root of 52486.

```
          *     *     *
        5 2 4 8 6.0 0 0   ( 3 7.4
        2 7
      -----
2 7 0 0 | 2 5 4 8 6
    6 3 0 |
      4 9 |
  -------
3 3 7 9 | 2 3 6 5 3
        -------------
              1 8 3 3 0 0 0
```

Repeat the process.

Tables are available which give the squares and cubes, and the square root and cube root of all numbers from 1 to 1000. They are so arranged that they give approximate values for the powers and roots of all numbers.

A small table of this kind is given below.

n	n^2	n^3	$\sqrt{n}$	$\sqrt{10n}$	$\sqrt[3]{n}$	$\sqrt[3]{10n}$	$\sqrt[3]{100n}$
1.	1.	1.	1.	3.162	1.	2.154	4.642
2.	4.	8.	1.414	4.472	1.260	2.714	5.848
3.	9.	27.	1.732	5.477	1.442	3.107	6.694
4.	16.	64.	2.000	6.325	1.587	3.420	7.368
5.	25.	125.	2.236	7.071	1.710	3.684	7.937
6.	36.	216.	2.449	7.746	1.817	3.915	8.434
7.	49.	343.	2.646	8.367	1.913	4.121	8.879
8.	64.	512.	2.828	8.944	2.000	4.309	9.283
9.	81.	729.	3.000	9.487	2.080	4.481	9.655
10.	100.	1000.	3.162	10.000	2.154	4.642	10.000

In the above table, the fifth column gives the square root of 10, 20, 30, and so on. The seventh and eighth columns give the cube root of 10, 20, 30, ... and 100, 200, 300 and so on. In larger tables of this kind, this arrangement makes it possible to look up the square root or cube root of any number by simply looking up the number as if the whole part was composed of the left hand period. Values between the numbers in the table can be estimated approximately. The process of finding values not given in the tables is called *interpolation.*

PERCENTAGE.

Percentage is an application of decimal fractions in which one one-hundredth or *one per cent* is used as the unit for computation. In decimal fractions any power of ten may be the denominator. In percentage, the denominator is always 100.

The words "*per cent*" come from the Latin words "per centum" and mean by the hundred.

One one-hundredth is called one per cent. The symbol for per cent is %. Four per cent is written 4%, and means .04 or 4/100 of the quantity.

Obviously, any per cent may be written as a decimal or as a common fraction. Also, any decimal or common fraction can be expressed in per cent and fractions of a per cent to any desired degree of accuracy.

EXAMPLES. $\frac{2}{3} = .6667 = 66.67\%$

$4\frac{1}{2}\% = .045 = \frac{45}{1000} = \frac{9}{200}$

$\frac{1}{4}\% = .0025 = \frac{25}{10000} = \frac{1}{400}.$

The principle numbers involved in percentage problems are the *base*, the *rate*, and the *percentage.* The terms *amount* and *difference* are also used.

The *base* is the number of which a certain number of per cents, or hundredths is taken.

The *rate* is the number of per cents, or hundredths taken.

The *percentage* is the amount of the number taken.

The *amount* is the sum of the base and the percentage.

The *difference* is the base minus the percentage.

When any two of the five numbers defined above are given, it is possible to find the others. Most problems deal only with the first three. The following rule is the basis of all computations in percentage.

Base × *rate* = *percentage.*

1. To find the percentage when the base and rate are given. Write the rate in decimal form and multiply the base by it.

EXAMPLE. A man bought a house for $6500 and sold it at a profit of 12%. What was his profit? What was the selling price?

$6500	Base
.12	Rate
$ 780.00	Percentage
6500.00	Base
$7280.00	Amount or selling price.

2. To find the rate when the base and percentage are given.

The use of percentage is so common that it is desirable to express the number of per cent one number is of an other. From the general rule, it follows:

Rate = Percentage ÷ base.

Hence, to find the rate per cent, divide the percentage by the base and express the resulting decimal as per cent.

EXAMPLE. A baseball team won 84 out of 156 games played in a season. What per cent of games did they win?

.5 3 11/13 Rate

Base 1 5 6) 8 4.0 0 0 Percentage
7 8 0
6 0 0
4 6 8
1 3 2

$$\frac{132}{156} = \frac{33}{39} = \frac{11}{13}$$

11

The team won $53\frac{11}{13}\%$ of their games.

3. To find the base when the rate and percentage are given.

From the general rule, it follows

Base = Percentage ÷ rate.

Hence, to find the base, express the rate as a decimal and divide the percentage by it.

EXAMPLE. The monthly income from an apartment house, is $640, which represents a gross annual income equal to $12\frac{1}{2}\%$ of the value of the property. What is the value of the property?

$640 × 12 = $7680 Annual income.

$12\frac{1}{2}\% = .125$ Rate in decimal form.

By aliquot parts,

$$\frac{\$7680}{.125} = \frac{\$7680 \times 8}{} = \$61{,}440.$$ Base or value.

4. Given the amount and rate to find the base and percentage.

The amount is equal to the base plus the percentage.

The base is equal to 100% and the percentage is equal to the base times the rate. Hence the amount is equal to 100% of the base plus the rate times the base. The base is found by dividing the amount by the sum of the rate and 100% expressed in decimal form.

EXAMPLE. The total sales in a department in December were $2416 which was an increase of 8% over the sales for November. What were the total sales in November? The increase?

November sales = 100%.
December sales = 100% + 8% = 108%
$2416 = 108% = 1.08

Hence, $$100\% = \frac{\$2416}{1.08}$$

= $2237.04 — November sales = base.
$2416 — $2237.04 = $178.96 Increase = percentage.

In a similar manner, rules may be developed that state how to find any of the quantities in percentage when two are given. If the amount and percentage are given, the base can be found by subtraction and the problem reduces to Case 2 above. If the difference and rate are given, the difference is set equal to 100% of the base minus the rate per cent, and the base is found by dividing the difference by the above per cent expressed as a decimal.

These processes are the same throughout all computations, though different names are used for the terms.

Base = Cost, capital, principal, valuation.
Rate = % of gain or loss, interest, commission.
Percentage = Gain or loss, discount, interest, premium.
Amount = Selling price with gain, total cost.
Difference = Selling price at a loss, net cost, proceeds.

Important Per Cents and Their Fractional Equivalents.

Per Cent.	Fractional Values.	Per Cent.	Fractional Values.
50%	1/2, .5	87-1/2%	7-8, .875
25%	1/4, .25	16-2/3%	1/6, .166
75%	3/4, .75	33-1/3%	1/3, .333
20%	1/5, .2	66-2/3%	2/3, .666
40%	2/5, .4	6-1/4%	1/16, .0625
100%	1, 1.	6-2/3%	1/15, .0666
12-1/2%	1/8, .125	8-1/3%	1/12, .0833
37-1/2%	3/8, .375	11-1/9%	1/9, .1111
62-1/2%	5/8, .625	14-2/7%	1/7, .1428

COMMERCIAL ARITHMETIC

PROFIT AND LOSS.

There are many applications of percentage in business. The whole theory of profit and loss, discount, bank discount, interest, commissions, taxes, stocks and bonds, insurance, exchange, and many other topics is based upon percentage. In some of these, the numbers used are the same as are used in percentage problems, in others the element of time enters into the problem and makes the computation more difficult. The simpler problems will be considered first.

In business, goods are bought and sold. The purpose of engaging in business is to make a profit from the transactions.

The *cost* is the price paid by a merchant for his goods. It is usually made to include freight and delivery charges. Sometimes additional items are charged against the purchase price and included in the cost. Individual concerns have different practices in this regard.

If goods are sold for more than cost, the amount over the cost is the *profit* or *gain* on the transaction.

If goods are sold at less than cost, the amount less than the cost is the *loss* on the transaction.

The *selling price* is the price at which goods are sold.

In figuring profit and loss, either the cost or the selling price may be taken as the base.

If the cost is taken as the base, the profit or loss is the percentage, the rate of gain is the per cent the profit is of the base, and the selling price is the amount or difference.

Many elements enter into the determination of the per cent of profit which the merchant needs to allow for in order to show a net profit. In large stores, the rent is pro-rated according to the area of floor space used by a department. The cost of heat, light, office expense, shipping expense, advertising, damaged goods, left overs, clerks salaries, and so on, must be allowed for in addition to a certain amount known as the *net profit* which is the real return on the money invested and the business itself. In order to guarantee a net profit of 10%, it is necessary to sell goods at a gross profit of much greater amount. In the case of seasonable or perishable goods, the per cent is much higher than in staples in which there is little or no loss due to handling.

A few illustrations of the type of problems met with in considering profit and loss are given below.

1. To find profit when cost and rate per cent of profit are given.

Multiply the cost by the rate per cent.

EXAMPLE. An article costing $5 was sold at a profit of 25%. What was the gain? What was the selling price?

$5 × .25 = $1.25, gain.
$5 + $1.25 = $6.25, selling price.

2. To find the rate per cent of profit when cost and selling price are given.

Subtract the cost from the selling price to find the profit, and divide the profit by the cost to find the rate per cent of profit.

EXAMPLE. Shoes were bought at $4.50 and sold for $6.00. What was the gain per cent?

$6.00 − $4.50 = $1.50

$1.50 ÷ $4.50 = $33\frac{1}{3}$% of gain.

3. To find cost, when selling price and per cent of profit are given.

The cost is 100%. The selling price is 100% plus the per cent of profit. *Divide the selling price in dollars by the selling price in per cent to get the cost in dollars.*

EXAMPLE. A grocer sells sugar at $7.60 per hundred pounds which gives him a gross profit on the transaction of 16%. What was the cost per hundred pounds?

Selling price = Cost + profit.
= 100% + 16%.
= 116%.
116% = $7.60
$100\% = \frac{\$7.60}{1.16} = \$6.55$ Cost price.

4. To find cost when profit and per cent of profit are given.

The profit is a per cent of the cost. *Divide the profit in dollars by the per cent of profit to get the cost in dollars.*

EXAMPLE. A merchant showed a gross profit of $13,650 for the year 1926. If this represents 26% of profit, what was the cost price of the goods handled?

$$\text{Cost} = \frac{\text{Profit}}{\text{\% of profit}}$$
$$= \frac{\$13,650}{.26} = \$52,500 \text{ Cost.}$$

These rules and many others may be expressed best by use of letters to represent the quantities being used. In all cases where multiplication or division by per cent of profit or loss is called for, the decimal form of the per cent is to be used.

This method of notation is explained in the section on algebra.

In the following brief rules or formulas,

c = Cost
g = Gain or profit
s = Selling price
l = Loss
% of g = Per cent of gain
% of l = Per cent of loss.

1. Given c and % of g; $g = c \times$ % of g.

2. Given c and s; % of $g = \frac{s - c}{c}$

3. Given s and % of g; $c = \frac{s}{100\% + \text{\% of g}}$

4. Given g and % of g; $c = \frac{g}{\text{\% of g}}$

5. Given c and % of l; $l = c \times$ % of l.

6. Given c and s; % of $l = \frac{c - s}{c}$

7. Given s and % of l; $c = \frac{s}{100\% - \text{\% of l}}$

8. Given l and % of l; $c = \frac{l}{\text{\% of l}}$

9. $s = c + g$ or $s = c - l$.

In case the selling price is taken as the base, these rules and formulas have to be changed slightly. The same principles determine the solution in this case and the problems are worked in a similar manner. It is necessary to remember that if the selling price is the base, it is taken as 100% and the cost is less than 100% in case profit is realized on the transaction.

MARKING GOODS.

In many lines of business, it is necessary to have the selling price of goods marked on them. It is also convenient to have the cost price marked on the goods. Even though the per cent of profit being taken may be entirely justifiable, it would occasion dissatisfaction on the part of many customers if these prices were known to them. When merchants desire to keep their cost or selling prices from the public, the price marks are written in letters or characters, the interpretation of which depends upon a knowledge of what is called the key word.

The key word may be any word or phrase composed of ten different letters. To this key certain letters called repeaters are added to allow the same figure to be repeated without disclosing the key.

If both the cost price and selling price are

marked on the goods in code, a separate key is used for each.

Cost Key.

C E N T U R Y B O K
1 2 3 4 5 6 7 8 9 0

Repeaters A and B

Selling Key.

S E L P R I C O D A
1 2 3 4 5 6 7 8 9 0

Repeaters X and Y.

Any word or phrase may be used. They are sometimes spelled backwards to make it more difficult for strangers to interpret the prices.

If the cost price is $4.25 and the selling price is $5.25, the price card would then be marked as follows:

Cost T EU — or — T EU / R ER
Sell R ER

If an article costs $6.66 and sells for $8.00, the marking is as follows:

Cost R AB — or — R AB / O AX
Sell O AX

Here, the two repeaters are used in the cost price to avoid showing R three times, while one repeater is used in the selling price to indicate the second zero. If the two prices are written above and below a horizontal line, as in the second form, the upper number is the cost and the lower the selling price.

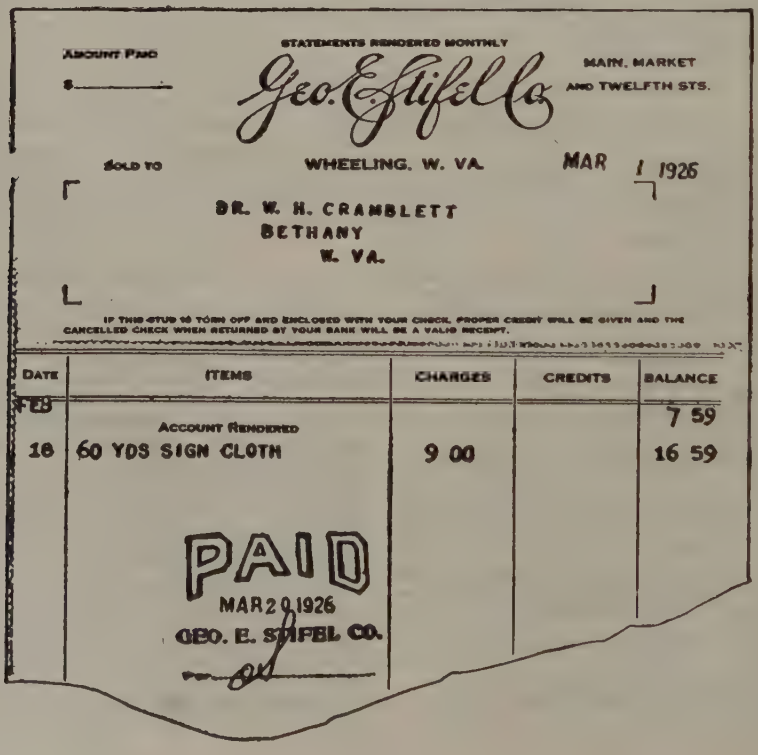
Many goods are bought from the wholesaler by the dozen and sold by the piece. In this case, the marking shows the wholesale price per dozen and the retail price per piece.

The person marking goods, is told to allow for a certain amount of profit. The retail or selling price is usually figured mentally and calls for a knowledge of the value in cents of the various twelfths of a dollar. In figuring the profit and selling price, the rate may be applied to the cost per dozen and then 1/12 taken, or the cost of a single article may be figured and the profit figured on this base.

BILLING AND TRADE DISCOUNT.

When goods are bought or sold, it is customary for the seller of the goods to furnish the buyer with a memorandum of the sale. This is called a *bill* or *invoice*. It contains a heading on which appears the buyer's name and address, the seller's name and address, the date of the bill; and an itemized statement of the goods purchased, the price of each item, and the total value of the entire bill. Somewhere on the bill the terms of the sale are stated. In case the purchase was with cash the bill should so state. If the buyer is to pay the shipping and delivery charges, this should appear on the bill and any part of this amount that is advanced by the seller is added to the total of the bill.

Goods are very often sold on terms and the terms are set out in the bill. Stores carry charge accounts for the convenience of their customers. These bills are due each month and are to be paid on or before the tenth of the month following that in which the purchase was made. Large stores usually furnish the buyer with a sales slip at the time of purchase and a monthly invoice or bill showing all goods purchased the preceding month.



Bills are often made out subject to certain reductions for prompt payment or other causes.

Discount is a deduction from an amount for any reason.

Cash discount is discount made because of prompt payment of an account. The amount of discount is usually stated in per cent. A ten day period is often allowed to enable the goods to be checked and the money received in what is called the cash period. Goods are billed with 2% discount allowed for cash in ten days or net in thirty days. This is indicated on the bill and the buyer is supposed to figure the discount he may take if the bill is paid within the time limits.

Commercial discount is a reduction from the price of anything. It occurs often in special sales where the merchant desires to move left over or damaged stocks quickly. A flat twenty or twenty-five per cent reduction is made on the selling price of all goods in the sale.

Trade discount is a reduction from a trade list. It is made to enable the retailer to buy from a wholesaler at a price which will enable him to resell at a fair price and with a reasonable profit. The catalogue can then be used by the retailer with his customers without letting them know the cost price of the article. The discount allowed by the wholesaler may vary from time to time. It often happens that rather than publish a new catalogue, a new or an additional discount is allowed on goods bought between certain dates.

Trade discounts are figured by the seller and appear on the bill as a credit. Additional credits for cash etc., are figured by the buyer

When several discounts are allowed on a bill, they are called a *discount series.* In a discount series, the first discount is figured and the reduction made and then the second discount is figured on the remainder, and so on. Or the first per cent of discount is subtracted from 100%, and the per cent of the whole which is equivalent to the second per cent of discount is figured and subtracted, and so on till all the series have been used. The resulting per cent is called the net cost rate factor. The product of the list price and the net cost rate factor (N. C. R. F.) is the net cost price.

EXAMPLE. Electric light bulbs are sold with 40% and 10% trade discounts and a 2% cash discount. The list price of an order is $160. Find the net cash cost.

FIRST METHOD.

40% of $160 = $64.00 First discount.
$160 — $64 = $96.
10% of $96 = $ 9.60 Second discount.
$96 — $ 9.60 = $86.40 Net price.
2% of $86.40 = $ 1.73 Cash discount.
$86.40 — $ 1.73 = $84.67 Net cash price.

SECOND METHOD.

100% − 40% = 60%
10% of 60% = 6%
60% − 6% = 54% N. C. R. F.
54% of $160 = $86.40 Net price.

Since the cash discount is always figured by the buyer when he pays the bill or invoice, it is not figured as a part of the series when the seller makes out the bill for the goods.

This method is especially valuable when the discounts to be figured are aliquot parts of 100.

A third method is also used for figuring discount series. The N. C. R. F. is found by subtracting each discount in the series from 100% and multiplying the remainders.

EXAMPLE. On a radio listed at $250.00, discounts of 33-1/3%, 10%, and 5% are allowed. What is the net price of the set?

100%	100%	100%	
33-1/3%	10%	5%	
66-2/3%	× 90%	× 95%	= 57% N. C. R. F.

$$\$250 \times .57 = \frac{.57 \times 1000}{4} = \$142.50 \text{ Net price.}$$

Tables showing the N. C. R. F. for the more common discount series are published and are a great convenience when much work of this kind is to be done.

Some Rate Per Cents, Their Equivalents, and the Net Price.

N. C. R. F.	N. P. %	N. C. R. F.	N. P. %
2-1/2, 2-1/2 = .0494	.9506	2-1/2, 5, 2-1/2 = .0969	.9031
2-1/2, 10 = .1225	.8775	5, 5, 2-1/2 = .1201	.8799

32-1/2, 10 = .3925	.6075	25, 7-1/2, 2-1/2 = .3236	.6764
35, 5 = .3825	.6175	30, 7-1/2, 5 = .3849	.6151
37-1/2, 7-1/2 = .4219	.5781	35, 5, 5 = .4134	.5866
40, 2-1/2 = .415	.585	37-1/2, 10, 5 = .4656	.5344

COMMISSION AND BROKERAGE.

A large part of the business today is carried on by middle men called commission merchants, brokers, or agents. This is especially true of such businesses as the selling or buying of farm products, insurance, real estate, stocks and bonds, etc.

The *principal* is the person or firm for whom the business is transacted.

The *commission* or *brokerage* is the rate per cent on the volume of business charged by the *commission merchant* for his services in the transaction. In some cases, a flat amount per unit of goods is agreed upon instead of a per cent.

Material forwarded by the principal to his agent is called a *consignment*. The person or firm shipping the goods is the *consignor*. The person or firm to whom the goods are shipped is called the *consignee*.

The *gross proceeds* of a sale is the total amount for which the goods are sold.

The *net proceeds* is the amount left from the gross proceeds after the commission and all expenses have been deducted.

The *prime cost* of a purchase is the net cost or first price paid by the agent for the merchandise.

The *gross price* is the net price plus the commission and all expenses of the transaction.

When goods are sold, the agent furnishes the principal an *account sales* showing all the details of the transaction and remits the net proceeds to him.

When goods are bought, the agent sends the principal an *account purchase* showing all details of the transaction and the principal remits the gross price to the agent.

Problems in commission and brokerage are problems in percentage where the elements considered are as follows;

The gross sales or prime cost is the base.

The rate of commission is the rate.

The amount of commission is the percentage.

Since other factors than these enter into the net proceeds, or the gross price, the terms amount and difference have little significance.

1. To find the amount of commission when the rate of commission and the gross proceeds or the net price are given.

EXAMPLE. A commission merchant sells a consignment of goods for $2,400. His commission is at the rate of 6%. How much did he receive and how much did he remit to the principal.

6% of $2,400 = $144 Commission to agent.
$2,400 − $144 = $2,256 Remitted to principal.

The commission is found by multiplying the gross proceeds, or the net price, by the rate of commission.

2. *To find the gross proceeds* when the rate of commission and commission are given.

EXAMPLE. A trust company charges 3% on the income from an estate for handling the investments of its funds. If the trust company receives $1,692.66 in one year, what was the gross income and what was the net income to the estate.

The commission is figured on the gross income.
3% of the gross income = $1,692.66

$$\text{Gross income} = \frac{\$1692.66}{.03} = \$56{,}422.00 = \text{Gross income.}$$

$56,422.00 − $1692.66 = $54,729.34 Net income.

The gross proceeds, or the prime cost, is found by dividing the commission in dollars by the rate of commission in per cent.

3. *To find the rate of commission* when the commission and gross income are given.

EXAMPLE. An agent collected a gross rental of $7,240 from the tenants of an apartment house. His commission amounted to $362. What was his rate of commission?

$$\frac{\$362}{\$7240} = .05 \text{ Rate of commission.}$$

The rate of commission is found by dividing the amount of the commission by the gross proceeds or the prime cost.

Let g = gross proceeds. p = prime price.
n = net proceeds. t = total or gross price.
c = commission. r = rate of commission.

The following formulas may be stated.

1. Given g and r; $c = g \times r$.
2. Given p and r; $c = p \times r$.
3. Given c and r; $g = \frac{c}{r}$, or $p = \frac{n}{r}$.
4. Given g and c; $r = \frac{c}{g}$.
5. Given p and c; $r = \frac{c}{n}$.

INSURANCE.

Insurance is an agreement wherein one party, for a consideration, guarantees to indemnify another in the event of certain events or happenings.

The agreement between the parties is called the *policy*. It is usually issued by the insurance company through its authorized agents and when properly signed is binding upon the company and the insured.

Many new forms of insurance are now being offered to the public. In some lines of insurance, the field is so new that the prices vary widely. In others, where there is much experience to determine probable hazards, the business is well established. The companies are carefully inspected by the authorities and the rates that may be charged are usually either fixed by law, or are determined by a board appointed under state control.

The consideration paid the insurance company by the insured is called the *premium*. The premium may be a certain per cent of the face of the policy, or it may be figured as a certain amount per $100 or per $1000.

There are two general kinds of insurance; namely *property insurance* and *personal insurance*.

Property insurance is of many kinds; as fire, theft, collision, rain, hail, tornado, cyclone, flood, transportation and baggage, live stock, crops, etc. In fact, some of the large companies advertise that they will insure anything.

The most common kind of property insurance is fire insurance. This kind of insurance guarantees the owner of property against loss by fire.

Fire insurance policies in the various states are quite similar. It is important that one understand the terms of his policy or he may unintentionally violate some of its conditions.

The rate of fire insurance is usually a certain amount per $100 for one year's insurance. The rate for two years is 1¾ times the one year rate. The rate for three years is 2½ times the one year rate. If a policy is written for less than one year, a "short rate" table is used to determine the percentage of the annual rate that should be charged. When a policy is cancelled, the amount to be refunded to the insured is sometimes figured "pro-rata" and at other times it is figured from the "short rate" table.

SHORT RATE TABLE FOR ONE YEAR POLICIES.

Time, days	Percentages to be charged or retained	Time, Days	Percentages to be charged or retained
1	2%	20	17
2	4	25	19
3	5	30 (1 mo.)	20
4	6	35	23
5	7	40	25
6	8	45	27
7	9	50	28
8	9	55	29%
9	10	60 (2 mo.)	30
10	10	65	33
11	11	70	36
12	11	75	37
13	12	80	38
14	13	85	39
15	13	90 (3 mo.)	40
16	14	105	46
17	15	120 (4 mo.)	50
18	16	135	56
19	16	150 (5 mo.)	60
165	66	270 (9 mo.)	85
180 (6 mo.)	70	285	88
195	73	300 (10 mo.)	90
210 (7 mo.)	75	315	93
225	78	330 (11 mo.)	95
240 (8 mo.)	80	345	98
255	83	360 (12 mo.)	100

Problems in insurance make use of the principles of percentage.

The value of the policy is the base.

The premium is the percentage.

The rate of premium per $100. is the rate.

1. EXAMPLE. The annual rate for a frame dwelling is published by the inspection bureau as .40 per $100. What is the premium on $3500 for three years?

$$2\frac{1}{2} \times .40 = 1.00 \text{ per } \$100 = 1\% \text{ Rate.}$$

1% of $3500 = $35.00 Premium.

The premium is equal to the value of the policy multiplied by the rate per cent.

2. A company spends $2000 per year on insurance written at the three year rate. If the annual rate is .6%, how much insurance will the company be carrying after three years?

$$2\frac{1}{2} \times .6\% = 1.5\% \text{ 3 year rate.}$$

$$\frac{\$2000}{.015} = \$133{,}333.33 \text{ Insurance written per year.}$$

$133,333.33 × 3 = $400,000.00 Total insurance after 3 years.

The premium divided by the rate equals the value of the insurance.

3. The annual rate is .32 per $100. How much will a policy for $7400 cost for 64 days?
Use the short rate table.
Annual premium = $23.68.
64 days takes 65 days charge.
Percentage to be charged is 33.
33% of $23.68 = $7.81 cost for 64 days.

Personal insurance includes all kinds of insurance on the life or person of an individual. One may insure his own life for any amount. The right of a person to take out insurance on the life of another is an unsettled question. Various decisions have been rendered by the courts and it seems from them that actual interest in the life of the person covered by the policy must be shown.

Among the common forms of personal insurance, may be mentioned life insurance, accident insurance, health insurance, disability insurance, and insurance against liability for injury to the person of others or personal liability insurance.

There are three general forms of life insurance:

1. *Life policies.* In policies of this kind, the policy is payable only at death of the insured. The premium may be made payable annually, in which case the policy is called *a straight life policy.* The premium may be paid entirely in advance, or in 5, 10, 15, or 20 annual payments. When these payments have been made, the policy becomes a *paid up policy.*

2. *Term policies.* In policies of this kind, the policy is payable only in the event of the death of the insured during the term of the policy. At the expiration of the term the insurance ceases.

3. *Endowment policies.* Policies of this kind represent both insurance and investment. They are payable in the event of the death of the insured at any time or at a fixed date if he is then living.

Policies are made payable to one's estate or to some person named in the policy. The person to whom the policy is to be paid is called *the beneficiary.*

Insurance is based upon certain vital statistics. Perhaps the most well known is the American experience table of mortality. From this table, the probable life expectancy is calculated. A portion of every premium is required by law to be set aside and invested in approved securities. The amount set aside is such that it will at stated interest rates amount to the value of the policy at the end of the period of life expectancy.

This reserve really belongs to the insured and determines the cash or loan value of the policy at any time. If the insured cancels a policy, he may receive this cash value or he may elect to take the value of the policy in paid up insurance. The various values of these options are printed on and made a part of the policies.

Since the life expectancy varies with the age of the individual, the cost of the same kind of insurance also varies. The amount charged by the company for a policy of $1000 for any age is printed in a rate book furnished the agent by the company. This amount is called the rate.

The rate per thousand dollars is multiplied by the number of thousands covered by the policy to find the annual premium.

The mathematics of life insurance goes beyond the limits of arithmetic. However, the computations involved in the buying and selling of insurance are all simple problems in percentage.

INTEREST.

Interest is money charged for the use of money.

The *principal* is the sum of money borrowed or used.

The *amount* is the sum of the principal and the interest.

The amount of the interest on a sum of money is determined by the *rate of interest.* The *rate of interest* is that part of $1, expressed as per cent, which is charged for the use of $1 for one year. The maximum rate of interest which may be charged is usually fixed by law. This varies in different states but is commonly from 6 to 8 per cent. The charging of a higher rate than that allowed by law is called *usury.*

The *time* is an important element in the figuring of interest. The rate of interest is usually stated for one year.

Simple interest is interest calculated on the principal only.

Compound interest is interest calculated on the sum of the principal and unpaid interest, the calculation being made at stated intervals.

Ordinary interest is figured on the basis of 360 days in a year.

Exact interest is figured on the exact number of days.

The principles of percentage are used in the solution of all interest problems.

The principal is the base.

The interest is the percentage.

The rate of interest is the rate.

When the interest is for a period other than one year, the time is expressed as a fraction of a year. The interest for one year multiplied by this fraction gives the interest for the period. In practice this general method is modified in different ways to secure a rapid solution.

SIMPLE INTEREST.

There are many ways in which the work of computing interest can be materially shortened.

1. Ordinary interest by the 60 day method. Since, in ordinary interest, 60 days or 2 months equals 1/6 of 360 days or one year; the interest for 60 days is 1/6 of the interest for one year.

Hence, if the rate is 6%, the interest for 60 days is 1/6 of 6% or 1% of the principal.

RULE. *To find the interest at 6% for 60 days, move the decimal point two places to the left in the principal.*

Also, *to find the interest at 6% for 6 days, move the decimal point three places to the left in the principal.*

To find the interest at 6% for one day, take 1/6 of the interest for 6 days.

Any period of time may be expressed as a certain number of 60 day periods plus a certain number of 6 day periods plus a certain number of days. The interest for these various times are found and added separately.

In practice, the use of the aliquot parts of 60 will be found helpful.

30 = 1/2 of 60.
20 = 1/3 of 60.
15 = 1/4 of 60.
12 = 1/5 of 60.
10 = 1/6 of 60.
6 = 1/10 of 60.
5 = 1/12 of 60.
3 = 1/2 of 1/10 of 60.
2 = 1/3 of 1/10 of 60.
1 = 1/6 of 1/10 of 60.

RULE. *To find the interest at any rate, divide the amount of the interest at 6% by 6 and multiply the quotient by the given rate.*

EXAMPLE. What is the interest on $890.50 at 6% for 11 months 10 days?

11 mo. 10 da. = 10 mo. + 1 mo. 10 da.
= 5 × 2 mo. or 60 da. + 40 da.

$ 8.9050 = Interest for 2 mo. or 60 da.
5

$44.5250 = Interest for 10 mo.
4.4525 = Interest for 30 da. (1/2 of Int. for 60 da.)
1.4842 = Interest for 10 da. (1/3 of Int. for 30 da.)

$50.4617 = Interest for 11 mo. 10 da.

EXAMPLE. What is the interest on $450 for 7 mo. 17 da. at 4-1/2%?

7 mo. 17 da. = 3 × 60 da. + 47 da.

$4.50 = Interest for 60 da.
3

$13.50 = Interest for 3 × 60 da.
2.25 = Interest for 30 da.
1.125 = Interest for 15 da.
.15 = Interest for 2 da.

$17.025 = Interest for 7 mo. 17 da. at 6%.

Custom determines whether this amount is called $17.02 or $17.03. The number is not rounded off till all computation is completed.

6)$17.025 Interest at 6%.
2.8375 Interest at 1%.
4-1/2 given rate.
1.41875
11.3500
$12.76875 or $12.77 = Interest for 7 mo. 17 da. at 4-1/2%.

2. Exact interest by the cancellation method.

In exact interest, the time is expressed in days and divided by 365, the number of days in one year.

When the interest is for a period other than one year, the interest is found by the following relation:

Interest = Principal × Rate × Time,

where interest and principal are expressed in dollars, the rate as a decimal fraction and the time as a fraction of one year of 365 days.

In the above relation any one of the elements can be determined if the other three are given.

The number of days between two dates can be figured out for each case but it is customary to refer to a table that tells at a glance the number required. Such a table is given under the heading of time in the dictionary of weights and measures. When the period of time includes the extra day of leap year or Feb. 29, one must be added to the figures in the table.

EXAMPLE. What is the exact interest on $890.50 from Mar. 10, 1925 to Feb. 20, 1926 at 6%?

From the table, the number of days between the given dates are 416 − 69 = 347.

$$\$890.50 \times .06 \times \frac{347}{365} = \frac{178.10}{\cancel{\$890.50}} \times \frac{\cancel{6}}{100} \times \frac{347}{\cancel{365}\ 73}$$

= $50.79 Exact int. at 6%.

EXAMPLE. What principal invested at 4% will bring in a return of $90.00 every 6 months?

From the interest relation.

$$\text{Principal} = \frac{\text{Interest}}{\text{Rate} \times \text{Time}}$$

$$= \frac{\$90.00}{.04 \times 1/2}$$

$$= \frac{\$90.00}{.02}$$

= $4500.00 Principal.

EXAMPLE. How long will it take for $1000 to double itself at simple interest at 5%.

From the interest relation.

$$\text{Time} = \frac{\text{Interest}}{\text{Principal} \times \text{Rate}}$$

$$= \frac{\$1000}{\$1000 \times .05}$$

= 20 years.

3. By the use of tables.

Many tables for computing simple interest have been developed. These are much used as they reduce the amount of work very materially. The following table is for ordinary interest from one to ten dollars. The times given may be readily combined to total any required time. The principal is broken up into the sum of units, tens, hundreds, etc. and the interest on each part is figured separately.

INTEREST TABLE AT 6%.

Time.	$1	$2	$3	$4	$5	$6	$7	$8	$9	$10
1 da.	.00017	.00033	.0005	.00067	.00083	.001	.00117	.00133	.0015	.00167
2 da.	.00033	.00067	.001	.00133	.00167	.002	.00233	.00267	.003	.00333
3 da.	.0005	.001	.0015	.002	.0025	.003	.0035	.004	.0045	.005
4 da.	.00067	.00133	.002	.00267	.00333	.004	.00467	.00533	.006	.00667
5 da.	.00083	.00167	.0025	.00333	.00417	.005	.00583	.00667	.0075	.00833
6 da.	.001	.002	.003	.004	.005	.006	.007	.008	.009	.01
7 da.	.00117	.00233	.0035	.00467	.00583	.007	.00817	.00933	.0105	.01167
8 da.	.00133	.00267	.004	.00533	.00667	.008	.00933	.01067	.012	.0133
9 da.	.0015	.003	.0045	.006	.0075	.009	.0105	.012	.0135	.015
10 da.	.00167	.00333	.005	.00667	.00833	.01	.01167	.01333	.015	.01667
20 da.	.00333	.00667	.01	.01333	.01667	.02	.02333	.02667	.03	.03333
1 mo.	.005	.01	.015	.02	.025	.03	.035	.04	.045	.05
2 mo.	.01	.02	.03	.04	.05	.06	.07	.08	.09	.10
3 mo.	.015	.03	.045	.06	.075	.09	.105	.12	.135	.15
4 mo.	.02	.04	.06	.08	.10	.12	.14	.16	.18	.20
5 mo.	.025	.05	.075	.10	.125	.15	.175	.20	.225	.25
6 mo.	.03	.06	.09	.12	.15	.18	.21	.24	.27	.30
7 mo.	.035	.07	.105	.14	.175	.21	.245	.28	.315	.35
8 mo.	.04	.08	.12	.16	.20	.24	.28	.32	.36	.40
9 mo.	.045	.09	.135	.18	.225	.27	.315	.36	.405	.45
10 mo.	.05	.10	.15	.20	.25	.30	.35	.40	.45	.50
11 mo.	.055	.11	.165	.22	.275	.33	.385	.44	.495	.55
1 yr.	.06	.12	.18	.24	.30	.36	.42	.48	.54	.60
2 yr.	.12	.24	.36	.48	.60	.72	.84	.96	1.08	1.20

Tables are also published for other rates though they can readily be computed from the 6% table.

EXAMPLE. What will be the interest at 6% on $456.00 for 3 mo. 26da.?

$6.00 = .06 × 100 = Int. on $400 for 3 mo.
1.333 = .01333 × 100 = Int. on $400 for 20 da.
.40 = .004 × 100 = Int. on $400 for 6 da.
.75 = .075 × 10 = Int. on $50 for 3 mo.
.1667 = .01667 × 10 = Int. on $50 for 20 da.
.05 = .005 × 10 = Int. on $50 for 6 da.
.09 = Int. on $6 for 3 mo.
.02 = Int. on $6 for 20 da.
.006 = Int. on $6 for 6 da.
$8.8157 = $8.82 = Int. on $456 for 3 mo. 26 da.

COMPOUND INTEREST.

In many lines of business, the interest is allowed to remain with the principal to become a part of the investment. Compound interest is used to determine the value of a savings bank deposit at any time. The same is true of the value of life insurance policies. Again, in order to have the proper amount of money in a sinking fund at some future date, certain sums must be laid aside each year. This also requires the use of compound interest.

Compound interest can not be collected at law. However it is not against the law to charge compound interest and to collect the same.

When the payments run over a long period of time and involve additions to the principal other than the accumulated interest, the solution of the problem becomes both tedious and complicated. To avoid making the problem too difficult, savings banks usually fix a day on

which the interest will be computed and make no allowance for fractional periods of less than one month.

Compound interest is always greater than simple interest after the first interest period. This is due to the fact that the interest on the interest is added at the end of the second and succeeding periods.

EXAMPLE. Compare the value of $500 at the end of 1, 2, 3, and 4 years at simple and at compound interest at the rate of 6%

SIMPLE INTEREST	COMPOUND INTEREST
$500.00 Principal.	$500.00 Principal.
30.00 Simple int. 1 yr.	30.00 Compound int. 1 yr.
$530.00 Value end 1st yr.	$530.00 Value end 1st yr.
30.00 Simple int. 2nd yr.	31.80 Compound int. 2nd yr.
$560.00 Val. end 2nd yr.	$561.80 Val. end 2nd yr.
30.00 Simple int. 3rd yr.	33.71 Compound int. 3rd yr.
$590.00 Val. end 3rd yr.	$595.51 Val. end 3rd yr.
30.00 Simple int. 4th yr.	35.73 Compound int. 4th yr.
$620.00 Val. end 4th yr.	$631.24 Val. end 4th yr.

The relative value of money at simple and compound interest at various rates of interest may be seen by a comparison of the amounts.

The times in which money will double itself at simple and compound interest are shown in the following table.

Time in Which Money Doubles at Several Rates.

Rate.	Simple Interest.	Compound Interest.
1%	100 yrs.	69 yrs. 245 da.
2%	50 yrs.	35 yrs.
2½%	40 yrs.	28 yrs. 26 da.
3%	33 yrs. 4 mo.	23 yrs. 164 da.
3½%	28 yrs. 208 da.	20 yrs. 54 da.
4%	25 yrs.	17 yrs. 246 da.
4½%	22 yrs. 81 da.	15 yrs. 273 da.
5%	20 yrs.	14 yrs. 75 da.
6%	16 yrs. 243 da.	11 yrs. 327 da.
7%	14 yrs. 114 da.	10 yrs. 89 da.
8%	12 yrs. 183 da.	9 yrs. 2 da.
9%	11 yrs. 40 da.	8 yrs. 16 da.
10%	10 yrs.	7 yrs. 100 da.

If the interest is computed once a year and added to the principal, the interest is said to be *compounded annually*. It may be done more often than this, in which case it is said to be *compounded semi-annually* or twice a year, *compounded quarterly* or four times a year, and so on. It will be seen that the oftener the interest is compounded the greater the value of the amount will be.

In order to solve problems in compound interest easily and accurately, tables which show the amount of $1 compounded annually for any number of years at different rates are used. The following is an example of such a table.

Table Showing Amounts of $1 at Compound Interest. Compounded Annually.

Years	2%.	2½%.	3%.	3½%.	4%.	4½%.	5%.	6%.	7%.	Years
1	1.0200	1.0250	1.0300	1.0350	1.0400	1.0450	1.0500	1.0600	1.0700	1
2	1.0404	1.0506	1.0609	1.0712	1.0816	1.0920	1.1025	1.1236	1.1449	2
3	1.0612	1.0769	1.0927	1.1087	1.1249	1.1412	1.1576	1.1910	1.2250	3
4	1.0824	1.1038	1.1255	1.1475	1.1699	1.1925	1.2155	1.2625	1.3108	4

EXAMPLE. Find the value of $4500 compounded annually at 4-1/2% after 12 years.

From the table, $1 at 4-1/2% amounts to $1.6959 after 12 years.

$4500 × 1.6959 = $7631.55 amount after 12 yrs.

If the interest is compounded semi-annually, use half the rate and twice the number of years to find the amount of $1. If it is compounded quarterly, use one-fourth the rate and four times the number of years.

EXAMPLE. Find the value of $512 after 8 years, interest at 5%, compounded semi-annually.

From the tables, $1 at 2-1/2% for 16 years amounts to $1.4845.
$512 × 1.4845 = $760.06 Amount after 8 years.

A compound interest problem closely connected with the problems of insurance is to find the value of any amount deposited annually for any number of years with interest compounded at regular intervals at a given rate. The premium on a life insurance policy is this kind of annual payment. The following table will show the value of $1 deposited annually for any number of years up to 30 at various rates of interest.

YEARS	ONE DOLLAR PER ANNUM PAID IN ADVANCE AT THE BEGINNING OF EACH YEAR						
	3%	3½%	4%	4½%	5%	5½%	6%
1							
2	1.030	1.035	1.040	1.045	1.050	1.055	1.060

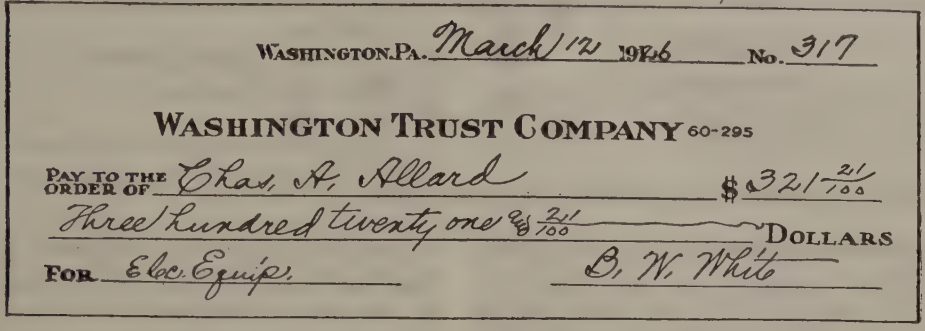
NEGOTIABLE PAPER.

A *negotiable paper* is the written promise or order for the payment of money which may be transferred by indorsement and delivery, or by delivery only, the indorser in turn guaranteeing the payment of the same.

The more common forms of negotiable paper are checks, notes, drafts, certificates or deposit, money orders, and bonds.

A *check* is an order drawn on a bank calling for payment in cash on demand. The individual signing the check must have deposited with the bank subject to check, an amount sufficient to cover it.

The person whose name is signed to the check is called the *drawer;* the bank on which it is drawn is called the *drawee;* the person to whom it is to be paid is called the *payee.*



WASHINGTON, PA. March 12 1926 No. 317

WASHINGTON TRUST COMPANY 60-295

PAY TO THE ORDER OF Chas. A. Allard $321 21/100

Three Hundred twenty one 21/100 DOLLARS

FOR Elec. Equip. B. W. White

When checks are transferred or paid, the payee writes his name across the back of the check, thereby *indorsing* it. Each person through whose hands the check passes adds his indorsement till it is finally stamped paid by the bank on which it is drawn.

If a check is drawn on a bank and there are not sufficient funds on deposit to cover it, it may be protested; in which case, each indorser is called upon in turn for the payment of the check.

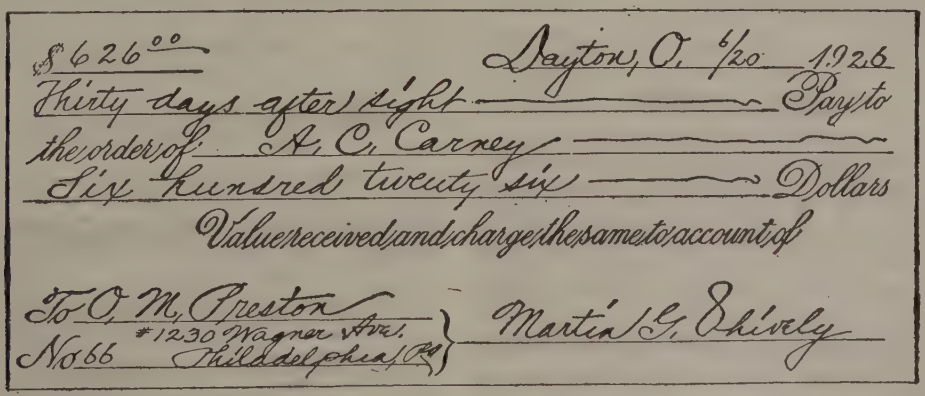
A *draft,* or *bill of exchange,* is a written order by one person on another, requiring the person to whom it is addressed to pay on demand, or at a certain fixed time, a certain sum of money to a person named therein, or to bearer.

The person or firm whose name is signed to the draft is called the *drawer;* the person or firm ordered to pay the amount is called the drawee; the person to whom the money is to be paid is called the *payee.*

A draft payable at sight is called a *sight draft.* Sight drafts are often attached to the bill of lading and they must be paid before the goods are delivered.

A draft payable a certain time after date or after sight is called a time draft.

A draft must be accepted by the drawee before it is binding upon him. In a time draft, "after sight," means after the date of acceptance.



$626 00 Dayton, O. 6/20 1926

Thirty days after sight Pay to

the order of A. C. Carney

Six Hundred twenty six Dollars

Value received and charge the same to account of

To O. M. Preston
#1230 Wagner Ave.
No 66 Philadelphia, Pa.

Martin G. Shively

A *trade acceptance* is a time draft drawn by the seller of goods on the buyer for the amount of the purchase price of the goods which has been accepted by the buyer. It is as binding as a note after his acceptance is written on it. If an oral acceptance can be established, it is as binding as a written acceptance.

A *bank draft* is a draft drawn by one bank on another payable to a third party.

A *promissory note* is the written promise to pay a certain sum of money to a person named in the note, to order or to bearer, on a certain date.

The person who signs the note is called the *maker;* the person to whom the note is to be paid is called the *payee.*

A promissory note is without interest unless the rate of interest is stated in the note.

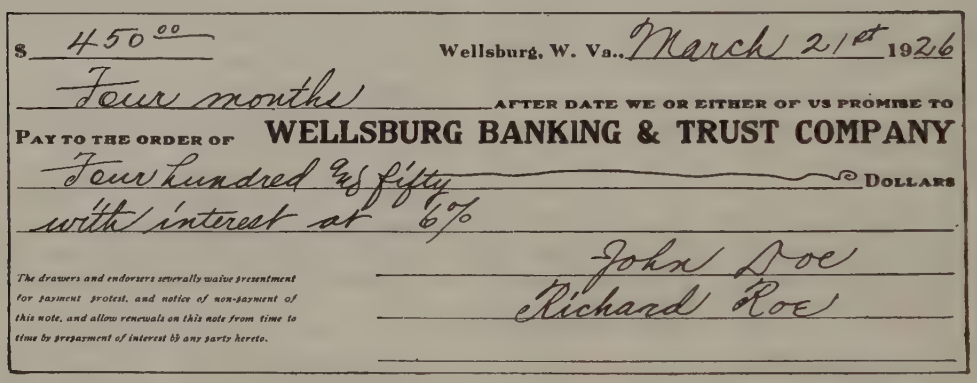
An ordinary note signed by one or two persons is called a *several note.* A note reading "we or either of us" is called a *joint and several note.*

An indorsement is anything written on the back of negotiable paper. An indorsement may add to the security of the paper; it may serve to transfer the paper to another; or it may record the payments made, thereby reducing the face value of the paper.



$ 450 00/100 Wellsburg, W. Va., March 21st 1926

BANK DISCOUNT.

Bank discount is the amount charged by a bank for cashing a note or draft before maturity. The amount of the discount is determined by reckoning the simple interest on the amount of the note from the day it is discounted to the date of maturity. This period is called the *term of discount.* The rate of interest charged is called the rate of discount. Exact interest is used in computing discount.

Problems in bank discount involve the principles of simple interest.

The principal is the value of the note at maturity.

The rate of discount is the rate.

The discount is the interest.

The period of discount is the time.

EXAMPLE. A time draft, 90 days after sight, for $1240 was accepted Feb. 24, 1925, and discounted by a bank on March 13, 1925. What were the proceeds from the note, if the rate of discount was 8%?

From the table for days between dates, 90 days after Feb. 24 would make the draft due May 25. The number of days between March 13 and May 25 is 145 − 72 = 73, the period of discount.

$$\frac{\cancel{\$1240}^{248} \times .08 \times \cancel{73}}{\cancel{365}_{5}} = \$19.84 \text{ Bank discount.}$$

$1240 − $19.84 = $1220.16 Proceeds.

EXAMPLE. A note for $3500, bearing 6% interest, dated Oct. 1, 1924, and payable in 4 months was discounted at 7%, Dec. 29, 1924. What was the proceeds and the bank discount?

4 mo. = 1/3 year.

$3500 × .06 × 1/3 = $70.00 Int. on note.

$3500 + $70 = $3570 Principal at maturity.

From Dec. 29 to Feb. 1 = 397 − 363 = 34 days.

$$\frac{\$3570 \times .07 \times 34}{365} = \$23.28 \text{ Bank discount.}$$

$3570 − $23.28 = $3546.72 Proceeds.

EXAMPLE. A firm needs $4286 to meet its payroll April first. What must be the face value of a note that will realize this amount if the note is payable in 60 days and the discount rate is 6%?

There is a discount of $.01 on each $1 of the face of the note. Hence the proceeds of each $1 is $.99.

$$\frac{\$4286}{.99} = \$4329 \text{ Face of note.}$$

Discount for 60 da. = 1% of face

= $43.29.

TAXES.

The expenses of the various branches of the government are met by funds collected from the people of the country through a system that attempts to distribute this expense equitably. Money collected in this way is called a *tax.*

Taxes are of two kinds; *direct* and *indirect.*

A *direct tax* is a tax levied directly upon a person or his property, or his business. This tax is to be paid by him from his own income. Examples of taxes of this kind are poll taxes, property taxes, income taxes, license fees, etc.

An *indirect tax* is a tax charged upon certain goods when they are imported into the country, or it is a tax on the manufacture or sale of certain commodities. In a tax of this kind, while the money is collected from some firm or individual, the actual burden of the tax is passed on in the price of the goods to be paid by the consumer. During the World War, many forms of indirect taxation were used to help raise the money needed for the unusual expenses of the Federal government. Examples of taxes of this kind are duties collected by the Bureau of U. S. Customs, sales taxes, excise taxes, etc.

Federal taxes are collected by the Federal government through the customs offices or through the department of internal revenue.

Some state taxes are collected by the state itself. The state personal and property taxes are collected for the state by the counties along with their own taxes.

Counties and incorporated towns and cities levy and collect their own taxes.

For purposes of taxation, property is of two kinds; real and personal.

Real property or *real estate* is immovable property, as houses and lands.

Personal property is movable property, as household furnishings, automobiles, machinery, stocks, bonds, mortgages, notes, cash, etc.

The *rate of taxation* is determined by the ratio between the needs of the government and the total value of the property subject to the tax.

In order to determine the total value of the property, *assessors* are elected or appointed who determine the taxable value of each person's property. The value placed upon property by the assessors is the *assessed valuation* of the property.

The total tax is levied upon the total assessed valuation of the property subject to the tax. Each person owning property is charged his proportionate share of the total tax.

The person who collects the tax is called a *collector.*

Problems in taxation are solved by the principles used in percentage.

The assessed valuation is the base.

The tax rate is the rate.

The tax is the percentage.

The tax rate is expressed in mills per dollar, or cents per hundred dollars. The rate per cent is found from the rate in mills by moving the decimal point one place to the left. The rate per cent is found from the rate in cents by moving the decimal point two places to the left. This is the same as thinking of the rate as so many dollars, usually a fraction, per hundred dollars.

1. To find the tax, when the assessed valuation and tax rate are given.

Assessed valuation × *rate* = *tax.*

EXAMPLE. Find the tax on property assessed at $15,000 if the tax rate is $1.845 per $100.

$1.845 per $100 = 1.845% = .01845

$15,000 × .01845 = $276.75 Amount of tax.

2. To find the tax rate, when the total assessed valuation and the estimated expense of the government are given.

Estimated expense ÷ *total valuation* = *tax rate.*

EXAMPLE. The assessed valuation of the property in a school district is $7,460,000. The estimated expense of the schools for the coming year is estimated at $56,700. Find the school levy.

$$\frac{\$56,700}{\$7,460,000} = .0076+ = \$.76 \text{ per } \$100. \text{ Tax rate}$$

In this example, no allowance is made for uncollected taxes. In actually levying the tax, the board might ask for $.77 per $100 or more.

3. To find the assessed valuation, when the tax and rate are given.

Tax ÷ *rate* = *assessed valuation.*

EXAMPLE. The tax levy is $1.82 per $100. Find the assessed valuation of property if the tax on it is $121.94.

$$\frac{\$121.94}{.0182} = \$6,700 \text{ Assessed valuation.}$$

STOCKS AND BONDS.

A *corporation* is a group of individuals authorized by a charter from the state to transact business as an individual. Its rights and powers are set forth in its charter and it can transact only such business as is allowed by its charter.

The money used in carrying on a business is called *capital.* The capital of a corporation is generally called *stock* or *capital stock.*

The *capital stock* of a corporation is divided into *shares.* These shares may have a definite par value, usually $100 per share. Par value of shares varies from 10 cents to $500. Some stocks have no par value.

The *market value* of stock is the value for which it can be sold. This varies above and below par, in which case the stock is said to be selling at a premium or at a discount.

Any person who holds one or more shares of stock is a *stockholder* in the corporation. A certificate of stock is issued to all stockholders.

The profits of the business are distributed to the stockholders of the corporation. These profits when they are distributed are called *dividends.* A dividend is usually declared as a certain per cent of the par value of the stock.

Capital stock is of two kinds, common and preferred. *Preferred stock* is stock on which a certain dividend must be paid before any dividend can be declared on the common stock. Common stock has no specified dividend.

The control of the corporation is in the hands of the stockholders who elect a group of men, called the directors to represent them in carrying on the business.

An *assessment* is sometimes levied against the stockholders to pay losses, special expenses, etc.

A *bond* is a written obligation, promising to pay, for value received, a certain sum of money,

called the face value, at a certain time, with interest at a stated rate to be paid at regular intervals during the life of the bond.

Bonds are issued by the government, by corporations, firms or individuals. They are secured by a first mortgage upon the property of the person issuing them. Federal bonds are guaranteed by all the resources of the federal government. Because of this security, the interest rate is lower than on some other bonds.

Many things enter into a determination of the value of bonds. Among the more important elements are the reputation of the government, municipality, or corporation issuing them, the rate of interest they bear, the date of maturity, the purpose for which they were issued, freedom from taxation and the type of security back of them.

Coupon bonds have interest coupons attached which are to be clipped and presented for payment in order on or after the date printed on them. Coupon bonds and coupons are payable to bearer.

Registered bonds are so called because the name of the owner is registered with an agent of the parties issuing the bonds. Interest on registered bonds is sent direct to the owner of the bonds on the interest dates. Such bonds are payable only to the owner or to some one legally appointed to act for him.

Stocks and bonds are bought and sold through agents called *brokers*. The fee or compensation paid him for his services is called *brokerage*.

When a broker buys stocks or bonds, the brokerage is added to the net cost to determine the actual cost to the customer. When a broker sells stocks or bonds, the brokerage is deducted from the actual selling price to determine the net proceeds of the sale to the customer. The amount of the brokerage is sometimes calculated as a certain per cent of the par value of the stocks or bonds. At other times, a fixed charge is made for bonds of different denominations and for shares of different par values. The problems of brokerage are similar to the problems of commission.

1. To find the cost of a purchase or the proceeds of a sale.

EXAMPLE. For stock selling below $10 per share the brokerage is $.075. Find the cost of buying 750 shares of stock quoted at $7-3/8.

$$\$7\frac{3}{8} = \$7.375$$

$7.375 + $.075 = $7.45 Actual cost per share.
$7.45 × 750 = $5587.50 Total cost.

2. To find the number of shares.

EXAMPLE. How many shares quoted at $108.50 must be sold to realize $33,700, if the brokerage charge is .15 per share? How much money will be left over?

$108.50 − $.15 = $108.35 Proceeds per share.
$33,700 ÷ $108.35 = 311 shares + $3.15 still needed
= 312 shares + $105.20 money left over.

3. To find the amount of dividend, when the rate and number of shares are given.

EXAMPLE. Find the dividend due on 75 shares, par value $100 per share, when the company declares a 7% dividend.

75 × $100 × .07 = $525.00 dividend.

4. To find the actual income on an investment.

EXAMPLE. Find the annual income on $24,000 invested in 5% bonds purchased at $83-1/3, par value $100. This is equivalent to what rate of interest on the cash invested?

$$\$24{,}000 \div \$83\frac{1}{3} = 288 \text{ No. of \$100 bonds.}$$

$28,800 × .05 = $1440 Annual income.
$1440 ÷ $24,000 = .06 = 6% on the investment.

PRACTICAL MEASUREMENTS.

Most persons are called upon at one time or another to find by measurement or otherwise, the length of lines, the area of surfaces and the volume of solids.

In this section, the general rules and formulas needed in the solution of problems of this kind are stated and their use explained. Following the general statement of the rules, many of the more common applications are explained as they occur in the home, in construction work, in business, and elsewhere.

Most readers are already familar with the terms used in measurements as well as many of the elementary rules. Simple problems of this kind are introduced into the course of arithmetic in the early grades. In the work which follows, informal definitions are given of all terms likely to cause difficulty.

The rules and formulas stated here are proved in the higher branches of mathematics, as geometry, algebra, trigonometry and calculus. All that is necessary, for one to be able to use them readily, is a satisfactory knowledge of the fundamental operations of arithmetic.

Wherever possible, two methods of solution should be used.

1. Graphical solution. Draw a figure to scale showing the relations between the given dimensions. Construct and measure to the same scale the required dimensions.

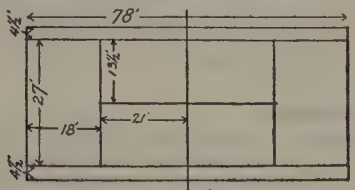
This method is much used by engineers and others in many practical problems; as in finding the load part of a bridge will carry.

2. Mathematical or analytical solution. Study the figure explained in (1) or draw a sketch showing the relation between the several dimensions. Determine the rule or formula that will express the unknown dimensions in terms of known magnitudes. Substitute in this formula, being careful to use numbers of like denomination.

DRAWING TO SCALE.

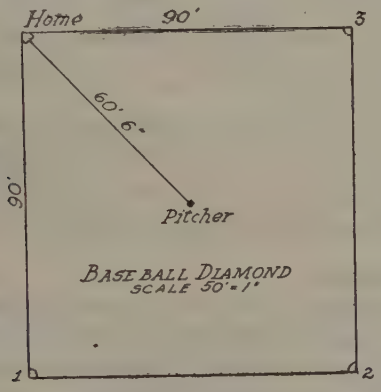
It is often impracticable to draw a picture of an object as large as the object itself. They are drawn, however, in such a way that each dimension of one figure will have a constant ratio to the corresponding dimension of the original object. To do this, a certain unit of length, such as one inch, in the drawing is made to correspond to some definite distance, such as 1 foot, 50 feet, 200 feet, 1 mile, or any convenient amount, in the original object. The ratio between these two distances is the *scale* of the drawing.

In the accompanying figure, the scale is 1" to 50', or 1 : 600". The figure represents a tennis court. The actual dimensions are marked on the sides.



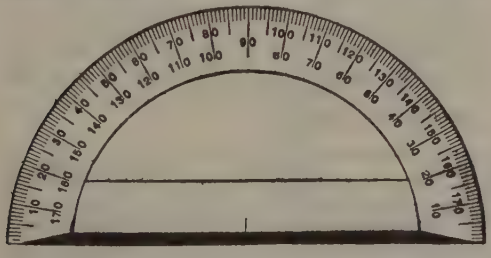
TENNIS COURT
SCALE 50' = 1"

Using the same scale, the drawing of a baseball field is a square. Each side is 1⅜ inches long. The pitchers box is located on a line between the home plate and second base. The actual distance from the pitchers box to home plate is 60' 6", represented on the drawing by a line 1⅛ inches long.



BASE BALL DIAMOND
SCALE 50' = 1'

The angles of a figure drawn to any scale must be equal to the corresponding angles of the original figure. In order to draw figures with the proper angles, an instrument called a *protractor* is used.



In measuring angles, the unit used is the *degree*.

The *degree* is defined to be 1/360th of the total of the angles at a point, or 1/90th of a right angle.

The protractor is a semi-circle which is divided into degrees from 0° to 180°. By placing the center of the circle at the vertex of the angle to be constructed or measured with the zero point of the circle falling over some point on one side of the angle, the location of a point on the other side may be determined or the value of the angle read directly from the protractor.

To construct an angle of 60°, draw a line from a point 0. Place the center of the protractor at 0, letting the zero of the protractor fall on the line. Mark the point where 60° on the protractor falls on the drawing. The line through 0 and this point is the other side of the angle.

GRAPHS.

A *graph* is a picture or diagram that illustrates relationship between the elements represented on the graph. It is in many cases a drawing to scale of the elements being studied.

Graphs are being used more and more to show the significance of statistical information. Formerly the graph was used mainly in the study of higher mathematics and economics. Now it is used in all the sciences. In addition to these technical uses, an examination of the daily and monthly publications in any locality will furnish one with examples of the many ways in which graphs are now being used.

To mention only a few of the more common uses to which graphs are being put at the present time, one lists the following, temperature, interest, receipts and disbursements, height and weight, distribution of expenditures, industrial statistics, etc.

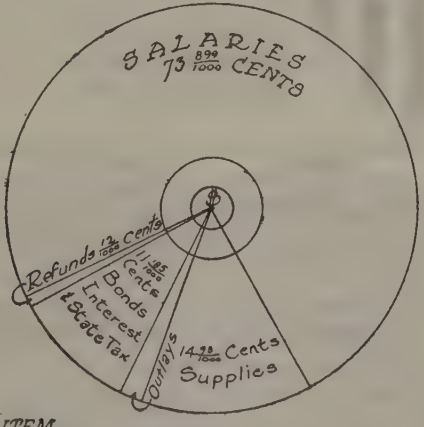
The graph is also used as a means of rapid calculation. Price-scales are really a form of this kind of graph.

The graph is usually presented in one of the three following forms.

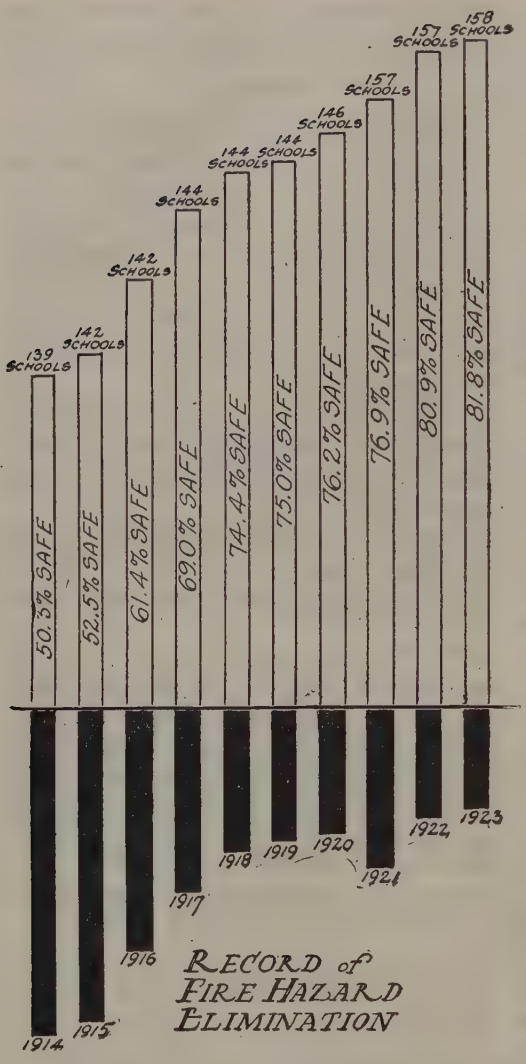
The area graph.

In graphs of this kind, the circle is usually used. This is divided into parts by lines drawn from the center to the circumference. The areas of these divisions are in the same proportion as are the quantities which they represent. This is accomplished by measuring the angles at the center of the circle and making each angle bear the same relation to 360° that the quantity represented by its division bears to the entire amount under consideration.

Distribution of payment of each dollar from JANUARY 1, 1923 to DEC. 31, 1923



ITEM NUMBER			
1a	Teachers' salaries	6198984.09	
1c	Other salaries	1353427.20	7552,411.29
2	Supplies		1440,263.03
3	Outlays		82,893.29
4	Bonds, Interest & State Tax		1143122.91
6	Refunds		1176.18
	TOTAL PAYMENTS		10219866.70



This graph shows the way in which each dollar received by the Board of Public Education of Pittsburgh was spent. The area of each part of the circle is to the area of the circle as the amount of money spent for the items indicated is to the whole amount.

The bar graph.

In graphs of this kind, lines of different lengths are placed side by side, vertically or horizontally, showing at a glance the relative value of the statistics they represent.

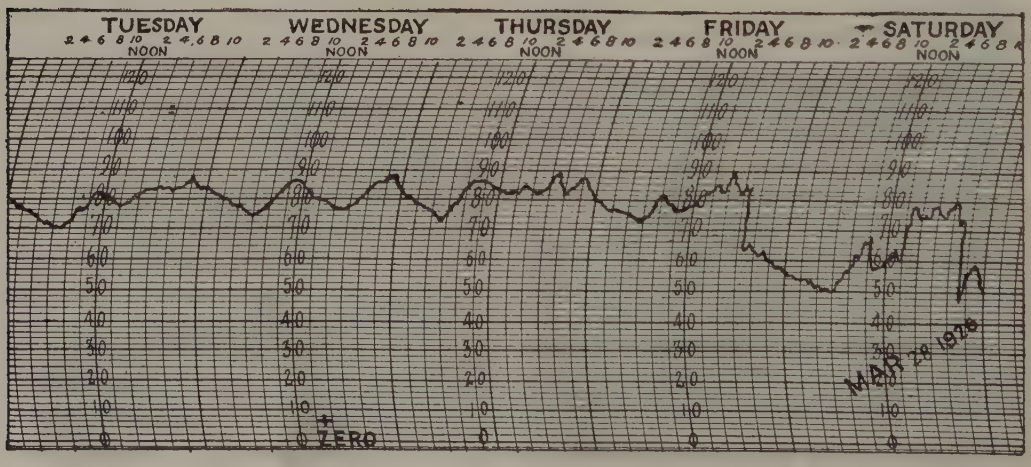
The black part of the bars represents the percentage of schools that did not have adequate means of taking care of the children in case of fire. This is the story of the progress that has been made by one city over a period of several years. Their program calls for the elimination of the unsafe school buildings by 1926. The effect of the World War and the high prices of 1921 are shown by an actual increase of unsatisfactory buildings. The original program called for the modernizing of the buildings by the end of 1920.

Very often, in practice, the bars are replaced by men of different heights to represent population at different times, by ships of different lengths to indicate the volume of shipping, by cigars of different lengths to indicate comparative consumption in certain years, and so on.

Rate graphs.

Graphs of this kind show, by means of straight lines or curves the way in which one quantity varies with respect to another. From the point of view of mathematics, it is much more valuable that any of the other methods.

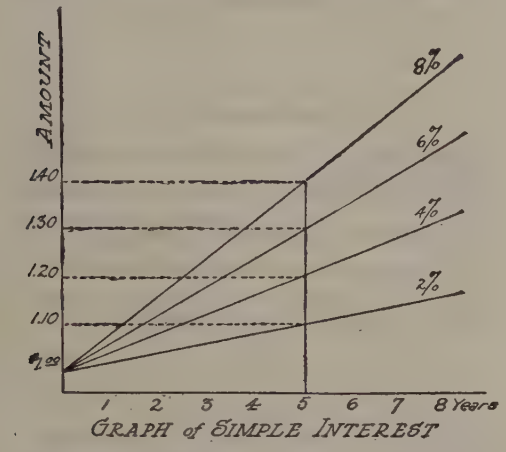
The direction of the lines or curves tells at once whether one quantity is increasing or decreasing as the other quantity increases. Curves of this kind may be drawn mechanically. An example of this kind of graph is seen in connection with the recording thermometer. It tells us at a glance when the temperature was increasing, when it was decreasing, what the temperature was at any time, when it was coldest, and when it was warmest during the interval covered by the graph.



Of especial interest here is the *straight line graph.* It is used when one quantity changes *uniformly* with respect to another.

THE GRAPH OF SIMPLE INTEREST.

The accompanying graph shows the value of $1 at various rates of simple interest over a period of 8 years. It will be noticed that the greater the rate of interest, the steeper the graph.

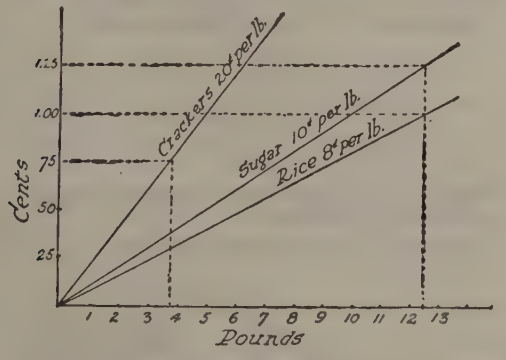


GRAPH of SIMPLE INTEREST

THE PRICE GRAPH.

Graphs of this kind are used to show the price of any number of units, when the price per unit is given. They are also valuable as showing how many units can be purchased for any given amount of money.

The following graph is drawn for rice @ 8c per lb., sugar @ 10c per lb., and crackers @ 20c per lb.



From the graph, the answers to the following questions can be read at once.

How many pounds of rice can be bought for $1? Ans. 12½ lbs.

How many pounds of sugar can be bought for $1.25? Ans. 12½ lbs.

How many pounds of crackers can be bought for $.75? Ans. 3¾ lbs.

In these problems, the amount is found on the vertical line at the left. Follow out along a horizontal line till the line representing the commodity is reached. From this point, follow a vertical line down to the horizontal line where the number of pounds is read immediately. In the following problems, this process is just reversed.

How much will 5½ lbs. of sugar cost? Ans. $.55.
How much will 7¼ lbs of rice cost? Ans. $.58.
How much will 5 lbs. of crackers cost? Ans. $1.

A modification of this kind of graph is used on all those scales which tell at a glance the price of any number of pounds at any price per pound.

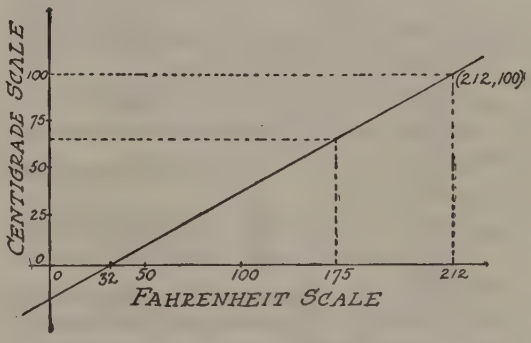
THE TEMPERATURE SCALE.

Temperature is measured by the *Fahrenheit system* in which freezing is 32° and boiling is 212°, and also by the *Centigrade system* in which freezing is 0° and boiling is 100°.

The relation between them is expressed by the formula,

$$C = \frac{5}{9}(F - 32°) \text{ or } F = \frac{9}{5}C + 32°.$$

The conversion of temperature Fahrenheit into temperature Centigrade and vice versa can be performed rapidly by the following graph.



Temperature Fahrenheit is measured on the horizontal line. Below zero is represented to the left of the point 0.

Temperature Centigrade is measured on the vertical line. Below zero is represented below the point 0.

The graph is drawn through the two known common points in the two systems, i.e., freezing and boiling.

To express 77° Fahrenheit in degrees Centigrade. Go up vertically from 77° F to the graph, then to the left horizontally to the Centigrade scale where the number of degrees Centigarde is read, namely 25°.

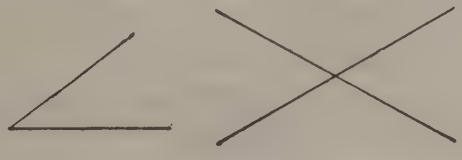
By reversing the process, it is seen that 40° C is equal to 104° F.

In all straight line graphs, increased accuracy may be secured by increasing the size of the scales.

MENSURATION.

LINES AND ANGLES.

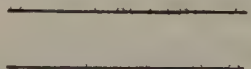
A line has only one dimension; *length.*



An *angle* is formed when two lines meet. If the lines are allowed to extend on both sides of their point of intersection, they form four angles at the point.

When two lines meet so that the four angles formed at their intersection are equal, the angles are called *right angles* and the lines are said to be *perpendicular*.

Two lines which will not meet even if they are extended indefinitely are equally distant everywhere and are said to be *parallel*.



PLANE FIGURES.

A plane figure bounded by straight lines is called a *polygon*. Polygons are named according to the number of their sides.

A *quadrilateral* is a plane figure bounded by four straight lines. It has four angles.

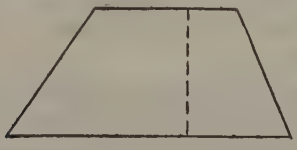
The side on which a figure may be thought of as resting is called the *base*.

The intersection of any two adjacent sides is called a *vertex*.

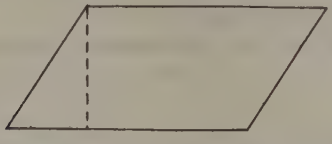
The *altitude* of a figure is the distance from the highest vertex to the base measured along the perpendicular drawn from this vertex to the base.

When certain relations exist between the sides and angles of a quadrilateral, the figure is given special names.

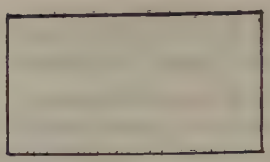
A *trapezoid* is a quadrilateral two of whose sides are parallel. The parallel sides are called *the bases*. The non-parallel sides are called *legs*. The altitude of a trapezoid is the perpendicular distance between the bases.



A *parallelogram* is a quadrilateral whose opposite sides are parallel. The opposite sides are also equal. Either pair of parallel lines may be taken as the *bases*. The other two are called *sides*. The altitude of a parallelogram is the perpendicular distance between the bases.



A *rectangle* is a parallelogram all of whose angles are right angles. The altitude of a rectangle is equal to the sides.



A *square* is a rectangle all of whose sides are equal.

A *diagonal* is a line joining two opposite vertices of a figure.

The following facts are stated for reference.

The diagonals of a parallelogram bisect each other.

The diagonals of a rectangle are equal.

A figure bounded by three straight lines is called a *triangle*. It has three angles.

A triangle is named from the nature of its angles:

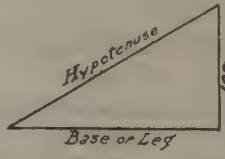
Acute, if all its angles are acute angles,
Obtuse, if one of its angles is an obtuse angle,
Right, if one of its angles is a right angle,
Equiangular, if all its angles are equal.

A triangle is named from the nature of its sides:

Scalene, if the sides are unequal,
Isosceles, if two of its sides are equal,
Equilateral, if all of its sides are equal.

The *hypotenuse* of a right triangle is the side opposite the right angle.

The other two sides are called *legs*.



In a triangle, any side may be taken as the base, and the vertex opposite the base is the vertex of the triangle.

The *altitude of a triangle* is the length of the perpendicular from the vertex to the base. If necessary, the base is extended so that the perpendicular from the vertex will meet it.

The following statements are given for reference.

The sum of the angles of any triangle is two right angles or 180°.

The angles opposite the equal sides in an isosceles triangle are equal.

Equilateral triangles are also equiangular. Each angle is equal to 60°.

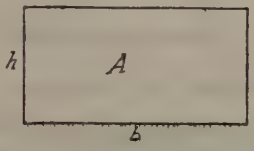
AREA.

The *area of a surface* is the ratio that the total surface bears to some surface taken as the unit of surface measure. (See Denominate Numbers and Dictionary of Weights and Measures.)

Many of the areas met with in common experience are made up of combinations of the plane forms just defined.

The rules for finding the areas of these figures will now be stated, following which many practical problems will be solved to indicate how these rules and formulas are used.

The area of a rectangle is equal to the product of its base and altitude.



The truth of this statement can be readily seen by dividing the rectangle into unit squares and counting the squares.

Let A = area, b = base, h = height or altitude.
Then $A = b \times h$.
Also, $h = A \div b$.
And $b = A \div h$.

EXAMPLE. The two adjacent sides of a rectangle are 4.8 inches and 7.5 inches. Find the area.

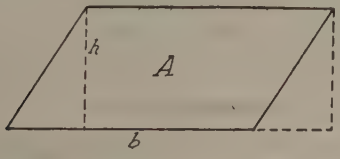
Multiplying by aliquot parts, $7.5 = \frac{3}{4}$ of 10.

$A = 4.8 \times 7.5 = \frac{3}{4}$ of $10 \times 4.8 = 36$ sq. in.

EXAMPLE. The area of a rectangle is 624 sq. ft. and the base is 26 ft. Find the altitude.

$$h = \frac{624}{26} = 24 \text{ ft.}$$

The area of a parallelogram is equal to the product of its base and altitude.



The truth of this statement can be seen by noticing that the triangle at the left may be moved to the right hand end of the parallelogram thus forming a rectangle having the same base and altitude.

Using the same notation as before.

$A = b \times h$.
$h = A \div b$.
$b = A \div h$.

EXAMPLE. Find the area of a field in the form of a parallelogram, the base equal to 17.4 rods and the altitude equal to 4.5 rods.

Sketch such a field. Notice that the area of the field does not depend upon the length of the sides of the figure.

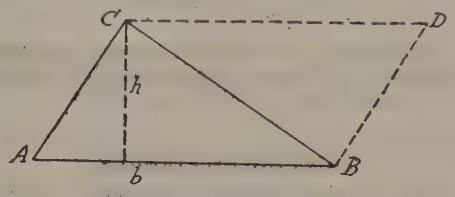
Area = 17.4 rd. × 4.5 rd.
= 78.3 sq. rd.

EXAMPLE. The area of a parallelogram is one-half acre. The base is 330 feet. Find the altitude.

Reducing to units of the same denomination, 1 Acre = 43,560 sq. ft.

$$h = \frac{21780}{330} = 66 \text{ ft.}$$

The area of a triangle is equal to one half the product of its base and altitude.



In the figure, the triangle, ABC, is obviously the same size as the triangle BDC. The two triangles together form a parallelogram. Hence, the area of any triangle is half the area of a parallelogram having the same base and altitude.

$$A = \frac{1}{2} \times b \times h.$$

$$b = \frac{2 \times A}{h}.$$

$$h = \frac{2 \times A}{b}.$$

EXAMPLE. Find the area of a triangle whose base is 4 feet 3 inches and altitude is 2 feet 8 inches.

4 ft. 3 in. $= 4\frac{1}{4}$ ft.

2 ft. 8 in. $= 2\frac{2}{3}$ ft.

$$A = \frac{1}{2} \times \frac{17}{4} \times \frac{2}{3} = 5\frac{2}{3} \text{ sq. ft.}$$

$= 5$ sq. ft., 96 sq. in.

EXAMPLE. Find the base of a triangle if its area is 426.8 square meters and its altitude is 12.8 meters.

$$b = \frac{2 \times 426.8}{12.8} = 66.687 \text{ meters.}$$

Area of a triangle in terms of its sides.

Let the sides of a triangle equal a, b, and c,

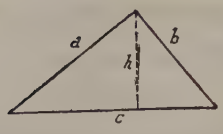
$s = \frac{1}{2}(a + b + c)$, h = altitude, A = area.

$$h = 2\frac{\sqrt{s\,(s-a)\,(s-b)\,(s-c)}}{b}$$

$$A\sqrt{s\,(s-a)\,(s-b)\,(s-c)}$$

$h = 2\,A \div b$

Fig. on page 424



EXAMPLE. Find the altitude and area of a triangle if a = 120′; b = 296′. and c = 186′.

$$s = \frac{1}{2}(120 + 296 + 186) = 301.$$

$$A = \sqrt{301 \times 181 \times 5 \times 115}$$

$$= 5597 \text{ sq. ft. nearly.}$$

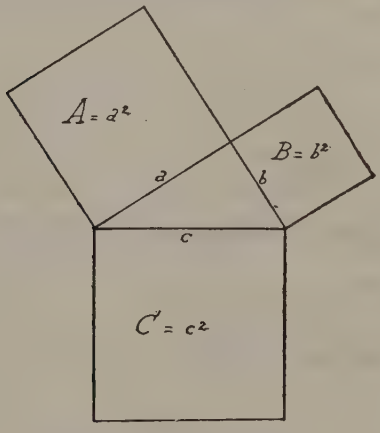
$$h = \frac{2 \times 5597}{296} = 37.8 \text{ nearly.}$$

Computations of this kind involve very large numbers. The work is greatly simplified by the use of special tables called *logarithms.*

THE RIGHT TRIANGLE.

One of the most famous theorems of mathematics is known as the Pythagorean theorem.

The area of the square on the hypotenuse of a right angle is equal to the sum of the areas of the squares on the two legs.



If a represents the hypotenuse, and b and c the legs of a right triangle.

$$a^2 = b^2 + c^2$$
$$a = \sqrt{b^2 + c^2}$$
$$b = \sqrt{a^2 - c^2}$$
$$c = \sqrt{a^2 - b^2}$$

Actual measurement of the areas of the squares will convince one of the truth of the theorem.

By the above theorem, the length of the diagonals of rectangles and the altitude of isosceles triangles can be found.

In a rectangle or square, if d = the diagonal.

$$d = \sqrt{b^2 + h^2}$$
$$h = \sqrt{d^2 - b^2}$$
$$b = \sqrt{d^2 - h^2}$$

EXAMPLE. Find the hypotenuse and area of a right triangle whose legs are 2′ 4″ and 1′ 7″ respectively.

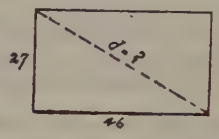
$$b = 2' 4'' = 28'', \; c = 1' 7'' = 19''.$$

$$a = \sqrt{28^2 + 19^2} = 33.84'' \text{ nearly.}$$

$$A = \tfrac{1}{2} \times 28 \times 19 = 266 \text{ sq. in.}$$

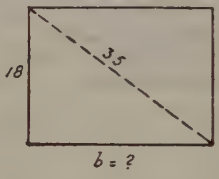
$$= \frac{266}{144} = 1 \text{ sq. ft., } 122 \text{ sq. in.}$$

EXAMPLE. A rectangular field has its two adjacent sides equal to 46 rd. and 27 rd. respectively. Find the length of the diagonal.



$$d = \sqrt{46^2 + 27^2} = \sqrt{2845} = 53.34 \text{ rd. nearly.}$$

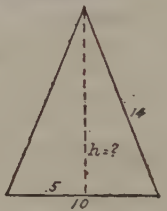
EXAMPLE. One side of a room is 18′ and the diagonal is 35′ Find the length of the other side.



$$b = \sqrt{35^2 - 18^2} = \sqrt{901} = 30' +.$$

EXAMPLE. Find the altitude of an isosceles triangle whose sides are equal to 14″ and whose base is 10″.

Note. This problem can be worked by the three side method but its solution is much simplified by the fact that the altitude of an isosceles triangle bisects the base and is perpendicular to it.

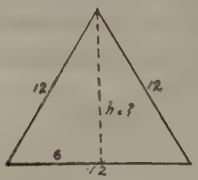


The problem is to solve the right triangle with hypotenuse equal to 14 and one leg equal to 5.

$$h = \sqrt{14^2 - 5^2} = \sqrt{171} = 13.07'.$$

EXAMPLE. Find the altitude and area of an equilateral triangle whose sides are equal to 12 inches.

NOTE.—An equilateral triangle is also isosceles.



$$h = \sqrt{12^2 - 6^2} = \sqrt{108} = 10.39'' \text{ nearly.}$$

$$A = \frac{1}{2} \times 12 \times 10.39 = 62.34 \text{ sq. in. nearly.}$$

APPLIED PROBLEMS.

Painting.

In figuring the price of painting, it is customary to calculate the number of square yards of surface to be painted. This is multiplied by the price per yard. In calculating the area of the surface no allowance is made for openings.

EXAMPLE. Find the cost of painting a wall 30′ long by 9′ high at 24c. per square yard.

$$\frac{30 \times 9}{9} = 30 \text{ sq. yd. of surface.}$$

$.24 \times 30 = \$7.20$ cost of painting.

Lathing and Plastering.

In lathing and plastering the unit of measure is the square yard. Allowance is made in the contract for openings. It is not often that the full opening is allowed. The lathing and plastering may be contracted for separately or as a single job.

EXAMPLE. Find the cost of lathing and plastering a room 16′ long by 12′ wide by 9′ high at 75c., per square yard, allowing 10 sq. ft. for each of three windows and 12 sq. ft. for each of two doors.

Area of walls $= 2 \times 16 \times 9 + 2 \times 12 \times 9 = 504$ sq. ft.

Area of ceiling $= 16 \times 12 = 192$ sq. ft.

Total allowed for openings $= 3 \times 10 + 2 \times 12 = 54$ sq. ft.

Net area $= 504 + 192 - 54 = 642$ sq. ft.

$$= 71\frac{1}{3} \text{ sq. yd.}$$

$71\frac{1}{3} \times .75 = \$53.50$ cost.

Papering.

Paper is bought by the single or double roll. A single roll is 18 inches wide and 8 yards long. In estimating the number of single rolls, the total width of all openings is deducted from the perimeter of the room. (It is estimated that the ends of the rolls, etc., will be sufficient to paper above and below all openings.) Divide this net perimeter by 18″ to find the number of strips required. Divide this quotient by the number of strips that can be cut from a double roll, being sure to make allowance for matching patterns. Many stores sell paper only by the double roll. Border strips are sold by the linear yard.

The price of papering may include the cost of the paper and the expense of hanging it, or these items may be cared for separately.

EXAMPLE. How much paper is needed to paper the walls of a room 20′ × 18′ × 10′ 6″, allowing for 2 windows 4′ wide, 1 door 3′ 6″ wide, and 6″ on each strip for matching patterns.

2 (20 + 18) = 76′	Total perimeter.
2 × 4′ + 3′ 6″ = 11′ 6″	Allowance for openings.
76 − 11′ 6″ = 64′ 6″	Net perimeter
64-1/2 + 1-1/2 ft. = 43	Strips required.
10′ 6″ + 6″ = 11′	Length of each strip.
48 + 11 = 4	Number of strips from double roll.
43 + 4 = 10-3/4 = 11	Double rolls required.

Carpeting.

Carpet is sold by the linear yard. One cannot buy a fractional width of carpet. Most carpets are ¾ of a yard wide, except ingrain which is 1 yard wide. Carpet is usually laid lengthwise of a room. Allowance must be made for matching patterns. First find the number of strips required and multiply this by the length of each strip.

EXAMPLE. How much brussels carpet is required to cover a floor 16 ft. long and 14 ft. wide? Allow 1 ft. for matching pattern.

¾ yd. = 2¼ ft. Width of carpet.

14′ ÷ 2¼′ = 6⅔ or 7 Number of strips.

16′ = Length of first strip since it matches nothing.

16′ + 1′ = 17′ Length of each of the other 6 strips.

6 × 17′ = 102′ of carpet in 6 strips.

102′ + 16′ = 118′ or 39⅓ yds, of carpet needed.

Flooring.

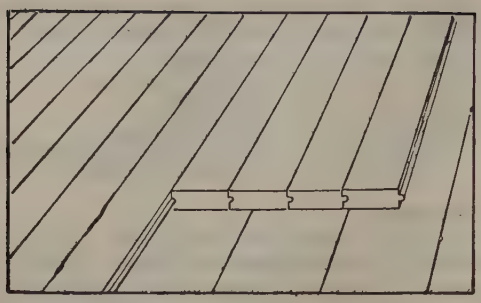
Flooring is usually bought by the *square foot* or by the *thousand board feet.* Flooring is finished with a tongue and groove. Lumber dealers always figure the lumber before it is "matched." Hence 1,000 square feet of flooring will not cover 1,000 square feet of floor. An allowance must be made to take care of the waste due to matching. This allowance is different for different widths of flooring. It is customary to allow 1/5 for waste, etc. Hence, to cover a floor, 1/5 more than the area of the floor or 6/5 of the area of the floor will give the amount of lumber needed.

EXAMPLE. A floor is 18′ 6″ by 14′ 6″. How much lumber is needed to floor it?

$$\frac{6}{5} \times 18\frac{1}{2} \times 14\frac{1}{2} = \frac{\overset{3}{\cancel{6}} \times 37 \times 29}{5 \times 2 \times 2}$$

$$= 321.9 \text{ square or board feet.}$$

In practice the lumber dealer will furnish the nearest number of square feet above this amount that will come out in even boards. In the above problem, if the flooring is in 16′ pieces, 4″ wide, the amount would be 324 square feet.



Roofing.

Roofing is usually bought and laid by the *square* of *100 square feet*. The actual amount of tile, slate, shingles, etc., vary with the size used and the nature of the roof. Contractors and builders have tables which show how many tile, etc. of a certain size are needed to cover a square. It takes about 900 standard shingles to roof a square. If the roof is quite steep, more of the shingle may be exposed to the weather and less shingles will be needed.

EXAMPLE. Each slope of a roof is 40′ by 20′. How many slate, 10″ by 16″, 4″ exposed to the weather, should be ordered to roof it?

$$\frac{2 \times 40 \times 20}{100} = 16 \quad \text{No. of squares in the roof.}$$

$$4'' \times 10'' = 40 \quad \text{sq. in.}$$

$$= \frac{40}{144} \quad \text{sq. ft. surface covered by each slate.}$$

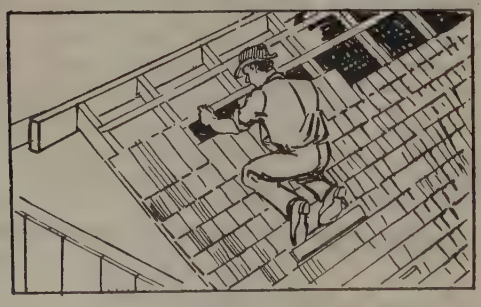
$$100 \div \frac{40}{144} = 360 \quad \text{No. of slate per square.}$$

$$16 \times 360 = 5760 \quad \text{Number of slate required.}$$

Shingles are either 12, 14, or 16 inches long. They are of varying widths, but the average width of a shingle is taken as 4 inches.

Each bunch of shingles is regarded as containing 250 shingles, each 4 inches wide, because a bunch of shingles consists of 25 double layers (or 50 single layers) each 20 inches (the width of 5 average shingles) wide. For this reason the bunch is regarded as containing 250 shingles, and 4 such bunches make a thousand shingles.

Shingles are usually laid with 4 inches of the butt, or thick part, exposed to the weather, the other parts of the shingles overlapping.



To find the number of shingles in a roof.

(1) Find the whole area of the roof in square inches.

(2) Multiply the width of an average shingle (4 inches) by the number of inches of the shingle to be exposed to the weather.

(3) Divide the whole area of the roof in square inches by the last named product and the result is the number of shingles required.

(4) To find cost, divide number of shingles required by 1,000, multiply quotient by cost per M.

EXAMPLE. How many shingles are needed to cover a roof which measures 20′ by 12′, if the shingles are laid 4″ to the weather?

$$\frac{20 \times 12 \times \overset{3}{\cancel{12}} \times \overset{3}{\cancel{12}}}{\underset{1}{\cancel{4}} \times \underset{1}{\cancel{4}}} = 2160 \text{ shingles.}$$

$$= 9 \text{ bundles.}$$

Miscellaneous applications.

There are many other practical problems in which the cost is figured at a certain price per square unit. Sidewalks, street pavements and similar problems are figured by the square yard. Etchings and engravings are charged for by the square inch. Most land problems are figured by the acre. In all cases, the rules for finding areas of simple figures are used as much as possible.

REGULAR POLYGONS AND CIRCLES.

A *regular polygon* is a polygon all of whose angles and all of whose sides are equal.

The *center* of a regular polygon is a point equally distant from all the vertices of the polygon.

The lines drawn from the center of the polygon to the vertices, are called the *radii* of the polygon. They divide the polygon into as many equal isosceles triangles as the polygon has sides. The altitude of these triangles is called the *apothem* of the polygon.

The *perimeter* of a regular polygon is equal to the sum of the sides. If P = perimeter, s = one side, and n = the number of the sides.

$$P = n \times s.$$

The *area* of a regular polygon is equal to one half the product of a side by the apothem, taken as many times as the polygon has sides. If A = area, s = one side, a = apothem, and n = number of sides,

$$A = \tfrac{1}{2}s \times a \times n.$$

EXAMPLE. Find the area of a regular hexagon (six sided polygon) one side of which is 12 inches.

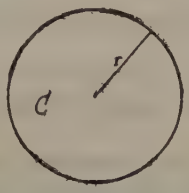
The radii divide the polygon into 6 equilateral triangles, since the angles at the center are all equal to 60°. Hence the radii are also equal to 12.

$$a = \sqrt{12^2 - 6^2} = 10.39'' \text{ nearly.}$$

$$A = \frac{1}{2} \times 12 \times 10.39 \times 6 = 374.04 \text{ sq. in.} \quad \text{Total area.}$$

By means of tables and relations studied in Trigonometry, the area, radius, and apothem of a regular polygon can be found if the number of sides and the length of one side are known. These tables are called trigonometric tables. They are used a great deal in problems in physics and engineering.

A *circle* is a plane figure bounded by a curved line every point of which is equally distant from a point within called the *center*. The curved line is called the *circumference*.



A straight line through the center of a circle, and having both its ends on the circumference, is called a *diameter*. A line from the center to the circumference is called a *radius*. All radii are equal and equal to half of a diameter.

It is proved in higher mathematics, and it may be shown true by careful measurements, that the ratio between the circumference and diameter is the same for every circle. The value of this ratio has been determined to a great degree of accuracy. For practical purposes it is taken equal to 3 1/7 or 3.1416. It is usually represented by the Greek letter π, pronounced pī.

It follows from the above, that the circumference of any circle is equal to π times the diameter. If C = circumference, d = diameter, and r = radius,

$$C = \pi d = 2\pi r.$$
$$r = C \div 2\pi.$$
$$d = C \div \pi.$$

EXAMPLE. Find the circumference of a circle whose radius is equal to 8.5′.

$$C = 2 \times 3\frac{1}{7} \times 8.5 = 53.428 \text{ feet}$$

or $C = 2 \times 3.1416 \times 8.5 = 53.4072$ feet.

The value 3-1/7 is larger than the real value of π. If accuracy is desired beyond the third significant figure, use the second value for π.

A circle may be thought of as being a regular polygon of a great number of sides. The circumference is the perimeter of the polygon. The radius of the circle is the apothem and also the radius of the polygon. The area of the circle is the same as the area of the polygon. These statements are actually true as the number of the sides of the polygon approaches infinity.

Hence, *the area of a circle* is equal to one half the product of the circumference by the radius. Using the same notation as above,

$$A = \frac{1}{2} \times C \times r = \pi r^2.$$

$$r = \sqrt{A \div \pi}$$

EXAMPLE. Find the area of a circle of radius 4′.

$$A = 3\frac{1}{7} \times 4^2 = 50\frac{2}{7} \text{ sq. ft.}$$

EXAMPLE. Find the area inclosed by a 1 mile circular race track.

1 mi. = 5280 ft., circumference of track.

$$r = \frac{5280}{2 \times 3.1416} = \frac{2640}{3.1416}$$

$$A = \cancel{3.1416} \times \frac{\overset{2}{\cancel{2640}} \times \overset{80}{\cancel{2640}}}{\cancel{3.1416} \times 3.1416} \times \frac{1}{\underset{22}{\cancel{7}}}$$

$$= \frac{160}{3.1416} = 50.930 \text{ acres.}$$

Note. Much work is avoided by indicating the solution and reduction to acres before multiplying. The cancellation eliminates some long problems in multiplication and division.

Any number which can be expressed as the quotient of two integers is called a *rational number*. All common fractions and all decimals which either end after a certain number of figures or start to repeat themselves are rational numbers.

All other numbers are called *irrational numbers*. It is impossible to find the value of an irrational number exactly. Among the more common irrational numbers are $\sqrt{2}$, $\sqrt{3}$ and π. Proofs that show these numbers irrational, establish the following facts.

A square and its diagonal have no common unit of measure that will be contained exactly in both of them.

It is impossible to construct a square whose area will be exactly equal to a given circle. This is known as the problem of squaring the circle and has engaged the attention of scholars through the centuries.

The ratio between a square and the circle that can be drawn within it touching its sides is 1.273, approximately.

VOLUME.

The *volume* of a solid is the ratio that the total volume bears to some volume taken as the unit of volume or capacity. (See Dictionary of Weights and Measures.)

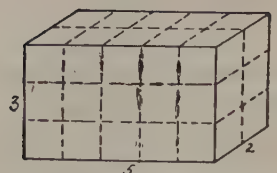
A solid figure in the shape of a box is called a *rectangular solid*. It has six rectangles for faces. The faces on opposite sides of the solid are equal and parallel. The face on which the figure seems to rest is called the *lower base*. The face parallel to it is the *upper base*. The other faces of the solid are called *sides*.

It can be readily seen that the number of cubic units in the solid illustrated equals the product of the *length*, *breadth*, and *depth*. These are called the *dimensions* of a solid.

The volume of a rectangular solid is equal to the product of the length, breadth, and thickness. These dimensions must be measured in terms of the same unit. The volume will be in terms of a cubic unit whose edge is equal to the linear unit used in measuring the dimensions of the solid.

Let a, b, and c, be the three dimensions. V = Volume.

$$V = a \times b \times c.$$
$$a = V \div b \times c.$$
$$b = V \div a \times c.$$
$$c = V \div a \times b.$$



EXAMPLE. How many cubic feet in a box 2′ × 4′ × 6′?

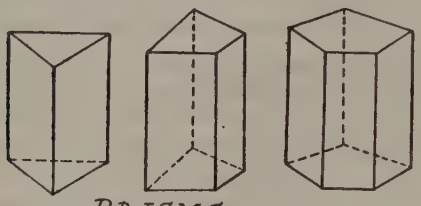
$$V = 2 \times 4 \times 6 = 48 \text{ cu. ft.}$$

EXAMPLE. The volume of the largest rectangular box that can be sent by parcel post is 3 cu. ft. 304 cu. in. Find its height if the base is a square 14″ on a side.

3 cu. ft. 304 cu. in. = 5488 cu. in. Volume.

$$c = \frac{5488}{14 \times 14} = 28''. \text{ Height of box.}$$

A *rectangular prism* is a solid whose bases are equal polygons and whose sides are rectangles.



PRISMS

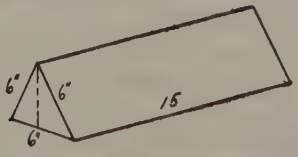
The *altitude* of a prism is the perpendicular distance between the bases. In a rectangular prism, it is equal to one of the edges of the prism.

The volume of a prism is equal to the product of the area of the base by the altitude. The area of the base must be found by the methods outlined in the previous sections.

Let, V = volume, A = area of base, h = altitude.

$$V = A \times h.$$

EXAMPLE. Find the volume of a triangular prism whose base is an equilateral triangle each side of which is 6″, and whose altitude is 15″.



A = 15.588. See equilateral triangles.
V = 15.588 × 15 = 233.82 cu. in.

A solid whose side is a curved surface and whose bases are equal and parallel curves is called a *cylinder*. The cylinders met with in ordinary work are all right circular cylinders. The *bases* are equal circles and the side curves uniformly and is at right angles with the bases.

The *altitude* is the distance between the bases.

The volume of a cylinder is equal to the product of the area of the base by the altitude.

The lateral area is the area of the side or curved part of the cylinder.

Let V = volume, A = area of base, h = altitude, L = lateral area, r = radius of base, T = total area.

$$V = A \times h = \pi \times r^2 \times h.$$
$$L = 2 \times \pi \times r \times h.$$
$$A = \pi r^2.$$
$$T = 2A + L = 2\pi r^2 + 2\pi \times r \times h.$$
$$= 2\pi r \times (r + h).$$

EXAMPLE. Find the volume and total area of a cylinder whose radius is 8′ and whose altitude is 10′.

$$V = 3\frac{1}{7} \times 8 \times 8 \times 10 = 2011\frac{3}{7} \text{ cu. ft.}$$

$$T = 2 \times 3\frac{1}{7} \times 8 \times (8 + 10) = 905\frac{1}{7} \text{ sq. in}$$

A *pyramid* is a solid whose base is a polygon and whose sides are triangles which have a common vertex, called the vertex of the pyramid.

The *altitude* of a pyramid is the perpendicular distance from the vertex to the base.

The volume of a pyramid is equal to the one-third the volume of a prism having the same base and altitude. Hence, *the volume of a pyramid* is equal to one-third the product of the base by the altitude.

Use the same notation as that used for prisms.

$$V = \tfrac{1}{3} A \times h.$$

In practice, the figures met with are usually *regular pyramids*, i.e., the bases are regular polygons and the faces are isosceles triangles. The vertex is directly above the center of the polygon.

EXAMPLE. The base of a pyramid is a square whose sides are 8″. If its altitude is 11″, find the volume.

$$V = \frac{1}{3} \times 8 \times 8 \times 11 = 234\frac{2}{3} \text{ cu. in.}$$

A *cone* is a solid whose base is a curved figure, usually a circle, and whose lateral surface tapers uniformly to a point called a vertex.

The *altitude* of a cone is the perpendicular distance from the vertex to the base. In a right circular cone, this line is measured from the vertex to the center of the base.

The *slant height* of a cone is the distance from the vertex to a point in the circumference of the base.

The volume of a cone is equal to one-third the product of the area of the base by the altitude.

Let V = volume, A = area of base, r = radius of base, h = altitude, s = slant height, L = lateral area, C = circumference of base.

$$V = \frac{1}{3} A \times h = \frac{1}{3} \times \pi r^2 \times h.$$

$$L = \frac{1}{2} C \times s = \pi r \times s.$$

$$s = \sqrt{r^2 + h^2}.$$

EXAMPLE. The diameter of the base of a right circular cone is 10′. If the altitude is also 10′, find the volume and lateral area.

$$V = \frac{1}{3} \times 3.1416 \times 25 \times 10 = 261.8 \text{ cu. ft.}$$

$$s = \sqrt{25 + 100} = 11.18' \text{ nearly.}$$

$$L = 3.1416 \times 5 \times 11.18 = 175.62 \text{ sq. ft. nearly.}$$

A *sphere* is a solid bounded by a curved surface, every point of which is equally distant from a point within called the *center*.

The *radius of a sphere* is a straight line joining the center with any point on the surface.

A *diameter* is any line through the center of the sphere terminating in the surface.

Let V = volume, S = surface, and r = radius.

$$V = \frac{4}{3} \pi r^3.$$

$$S = 4 \pi r^2.$$

EXAMPLE. The radius of the earth is approximately 4000 mi. Assuming it to be spherical in shape, find its total area and its total volume.

$$V = \frac{4}{3} \times \frac{22}{7} \times 4000^3 = 258{,}180{,}000{,}000 \text{ cu. mi.}$$

With the approximate assumptions made in this problem, there is no value in more than three or four significant figures. An error of 1 mile in the radius will result in an error of over 2,500,000 cu. mi. in the volume.

$$S = 4 \times \frac{22}{7} \times 4000^2 = 201{,}000{,}000 \text{ sq. mi.}$$

APPLIED PROBLEMS, VOLUME.

Bricklaying and Masonry.

A standard brick for building purposes measures about 8″ × 4″ × 2″. It occupies more space than this in a wall however, due to the mortar between the joints.

Masons and builders use various methods in figuring the number of bricks required to build a wall. The following is a method in common use in many places.

From the area of the outside surface of the wall or building deduct the area of all the openings and the area of one side of each of the corners. (This is necessary to keep from counting the volume of the corners twice.)

For a wall 1 brick thick (4″ thick) allow 7 bricks for each square foot of surface.

For a wall two bricks thick (8½″ thick) allow 14 bricks for each square foot of surface.

For a wall three bricks thick (12¾″ thick) allow 21 bricks for each square foot of surface.

A wall one brick thick is used as a brick veneer over frame or tile, for partitions, and so forth. A wall two bricks thick is used in the construction of small buildings, to fill the spaces between steel pillars in larger constructions, and for other purposes.

Other materials are used beside bricks, as stone, tile, concrete blocks, etc., which require special methods of computation depending upon the size of the unit used and the specifications of the construction.

Bricks are quoted by the thousand (M) but they may be bought in any fractional part of this amount.

EXAMPLE. The walls of a brick house are 32 feet long, 24 feet wide and 19 feet high and 3 bricks thick. Allowing for 15 windows averaging 3-1/2 ft. by 6 ft. and 3 doors averaging 3-1/2 ft. by 7 ft., find the number of bricks required to build the wall.

$$2\,(24 + 32) \times 19 = 2128 \text{ sq. ft. Total surface.}$$

$$4 \times \frac{13}{12} \times 19 = 82\frac{1}{2} \text{ sq. ft. Corners.}$$

$$15 \times 3\frac{1}{2} \times 6 = 315 \text{ sq. ft. Windows.}$$

$$3 \times 3\frac{1}{2} \times 7 = 73\frac{1}{2} \text{ sq. ft. Doors.}$$

$$82\frac{1}{3} + 315 + 73\frac{1}{2} = 470\frac{5}{6} \text{ sq. ft. Total allowance.}$$

$$2128 - 470\frac{5}{6} = 1657\frac{1}{6} \text{ sq. ft. Surface counted.}$$

$$\frac{21 \times 1657\frac{1}{6}}{1000} = 34.8 \text{ M bricks required.}$$

Concrete.

The cost of concrete is usually figured in terms of a *cubic yard*. In figuring the volume, allowance is made for all openings. A separate charge is made for *forming*, unless this is included in the estimate.

Concrete is a mixture of cement, sand, gravel or crushed stone, and water. The proportions of these various substances vary according to the nature of the construction. The mixture is named by stating in order the number of parts of cement, sand, and gravel. Recent experiments indicate that the mix should be made with as little water as possible.

When the sand and gravel are mixed together, the volume of the mixture is less than the sum of the volumes of the two materials. This is again true when the cement is added. This is due to the fact that the smaller particles fill the voids or spaces between the larger pieces. The volume is increased over that of the gravel in the different mixtures used.

The following table shows the amount of the various materials in the mixtures listed. Cement is measured by the barrel = 400 lbs. gross = 386 lbs. net. In the mixtures, one measure of cement is one sack or 1/4 barrel; the sand and cement are measured in cubic feet.

Mixture	Sacks of cement per cu. yd. of concrete.
1 1	19.2
1 1½	15.5
1 2	12.8
1 2½	11.0
1 2: 3	7.0
1 2: 4	6.0
1 3: 5	4.7
1 3: 6	4.3

To find the amount of sand necessary to make a cubic yard of concrete, multiply the number of sacks of cement by the number of parts of sand in the mixture to be used and divide by 27.

To find the amount of gravel necessary to make a cubic yard of concrete, proceed in the same way with the number of parts of gravel in the mixture to be used.

EXAMPLE. The excavation for a cellar is 32′ by 24′ by 5′. How much of cement, sand, and gravel are needed to build 12 inch walls of a 1:3:5 mixture?

$2 \times (32 + 22) \times 5 \times 1 = 540$ cu. ft.
$= 20$ cu. yd. Total volume.

From the table,

$$4.7 \times 20 = 94 \text{ sacks} = 23\frac{1}{2} \text{ bbls. cement.}$$

$$\frac{94 \times 3}{27} = 10\frac{4}{9} \text{ cu. yd. sand.}$$

$$\frac{94 \times 5}{27} = 17.4 + \text{ cu. yd. gravel.}$$

Notice that the width of the cellar is taken as 22′ to avoid counting the corners twice. In practice, it is not necessary to solve for the amount of sand and gravel in a cubic yard. Instead, multiply the total number of sacks by the number of parts of sand and gravel in the mix. This gives number of 100 lbs. of each.

Board measure.

One foot in board measure or one board foot is equal to a board one foot square and one inch thick. Its volume is one-twelfth of a cubic foot.

Boards less than one inch thick are figured as if they were one inch in thickness.

To find the number of board feet, multiply the length in feet by the width in feet by the thickness in inches. It is obvious that any one of these three dimensions may be expressed in inches and the other two in feet.

Lumber is sold by the thousand (M) board feet.

Many special methods are used in lumber yards to figure quickly the number of board feet in lumber of various widths and thicknesses.

The following are samples of some of these special rules.

Thickness	Width	To find number of board feet.
1 inch	2 inches	Take 1/6 of the length.
1 inch	3 inches	Take 1/4 of the length.
1 inch	4 inches	Take 1/3 of the length.
1 inch	6 inches	Take 1/2 of the length.
1 inch	8 inches	Deduct 1/3 the length.
1 inch	10 inches	Deduct 1/6 the length.
1 inch	12 inches	Take the length.
2 inches	4 inches	Deduct 1/3 the length.
2 inches	6 inches	Take the length.
2 inches	8 inches	Add 1/3 the length.
2 inches	10 inches	Add 2/3 the length.
2 inches	12 inches	Take twice the length.

EXAMPLE. How many board feet are there in 42 plank, 2″ × 8″ × 16′ long?

First method.

$$42 \times \frac{1}{6} \times 16 \times 8 = 896 \text{ board feet.}$$

Second method.

$16 \times 42 = 672$ Total length.
Add 224 1/3 length.
896 Board feet.

Capacity of Bins, Reservoirs, etc.

Many products are now sold by weight, as coal, wheat, grain of all kinds, fruit, vegetables, and so on. It is still customary to speak of these products in terms of bushels. In order to secure uniformity in this connection, the federal government and the several states have established by statute the weight of a bushel of these various commodities.

One bushel of the following substances has the indicated weights:

Product	Weight	States
Wheat	60 lbs.	All
Shelled corn	56 lbs.	All
Oats	32 lbs.	All
Potatoes	60 lbs.	Most
Beans	60 lbs.	All
Apples	48 lbs.	Most

The variation between states, when it exists, is very slight. The tendency is toward uniformity.

It is often desirable to reach an estimate as to the amount of material in a bin without going to the expense of weighing or measuring the material in it. This is accomplished readily by the use of the following rules.

The same remarks hold with regard to the contents of cisterns, resevoirs, vats, etc.

A heaped bushel contains 2,747.71 cubic inches.
A stricken bushel contains 2,150.42 cubic inches.
A peck contains 537.6 cubic inches.
A quart contains 67.2 cubic inches.
A pint contains 33.6 cubic inches.
A hogshead contains 8.422 cubic feet.
A barrel contains 4.211 cubic feet.
A gallon (liquid) contains 231 cubic inches.
A quart (liquid) contains 57.75 cubic inches.
A pint (liquid) contains 28.875 cubic inches.

(1) Find the cubic contents of the vessel or bin in inches.

(2) Divide the contents by the number of cubic inches contained in the chosen unit, whether gallon, bushel, or barrel.

For quick, rough estimates it may be remembered that 1 cubic foot equals nearly .63 of a heaped bushel, or equals nearly .80 of a stricken bushel, or equals nearly 7.5 liquid gallons, or equals nineteen eightieths of a barrel. These fractions are to be used as multipliers of the cubic contents in corresponding dimensions. Thus—

Volume in cubic feet × .63 gives the number of heaped bushels.

Volume in cubic feet × .80 gives number of stricken bushels.

Volume in cubic feet × 7.5 gives number of liquid gallons.

Volume in cubic feet × nineteen eightieths gives the number of barrels.

ALGEBRA.

In the Aahmes copy before mentioned, the simple equation appears thus: Hau (literally heap), its seventh, its whole, it makes 19; if put in modern symbols means $\frac{x}{7} + x = 19$. The Egyptians made no further progress in algebra; the Greeks used it in connection with their wonderful system of geometry. In Euclid (c. 300 B. C.), we find formulas for $(a + b)^2$ with other algebraic relations worked out by geometric figures. Heron of Alexandria (c. 100 B. C.) solved quadratic equations. To Diophantus (last half third or first part of fourth century A. D.) we are indebted for the first book written on algebra chiefly. He used one unknown quantity, symbols for equality and subtraction, while his favorite subject was indeterminate equations of the second degree. Aryabhatta, a Hindu mathematician (476), made some contributions, but no additions to the science. About 800 there came a mathematician, known from his birthplace as Al-Khowarazmi, who wrote the first great work and gave the science its present name. He called it "al-jabir;" it became in Latin, "algebrae," in the sixteenth century English, "algiebar," and modern English, "algebra." For 700 years little advance was made in the science, until in Italy, Cardano, Ferro, and Fiori solved cubic equations. Vieta, a Frenchman, was the founder of our present symbolic system (1591).

Algebra is at first but a continuation and extension of arithmetic. The methods employed are so improved however that many problems that were not solved in arithmetic are worked easily here. Other subjects grow out of the study that have no seeming connection with arithmetic. The field of algebra as the term is now understood, is very large. It is safe to say that much of modern science has been discovered by use of the principles and theorems of algebra. A knowledge of the science is necessary to one who plans to do work in mathematics, physics, engineering, chemistry, economics, or in practically any technical or professional field. It is usually studied in the ninth grade or first year of the high school course. It is an almost universal requirement for entrance to colleges and technical schools. This is true not only because of the "cultural" value of the study, but also because of the practical usefulness of the content of the course.

While algebra is now a science of itself, the best approach to an understanding of the subject is by noticing its close relation to arithmetic. For many centuries, its sole purpose was to furnish a short and systematic solution for the problems of arithmetic. The rules used there are stated concisely by use of the letters and symbols of the new science.

Three new ideas are introduced at the very beginning of Algebra. It is necessary to gain a clear understanding of each of these before the science can be developed. A brief statement concerning each of these is given here, after which each idea is developed in detail.

The most obvious difference, that is the difference which is noticed immediately is the use of letters to represent numbers. Science and industry make much use of this practice in expressing general laws and rules in brief and concise form. Several examples of this kind appear in various sections on arithmetic. For example in the section on profit and loss, page 461 and the sections on area and volume on pages 477 and 478 and 481 to 484.

The second new idea involves a new concept of number or rather an extension of the number system used in arithmetic. The new numbers are called negative numbers. This extension of the number system calls for an examination of the fundamental operations and a restatement of the rules of addition, subtraction, multiplication and division. These new rules must be so stated that they do not contradict any of the work in arithmetic. This is done on pages 486 and 487.

When these two ideas are combined the number system of algebra is complete. The various laws for combining the algebraic numbers are developed considering in order polynomials, fractions and irrational expressions.

The third new idea is that of the equation. The use of letters as numbers in arithmetic referred to above, also illustrates the form of the equation. Many problems can be solved easily when the principles of the equation are understood. Various examples of problems of this kind appear in the following pages. They are placed along with the material which explains the operations on algebraic numbers used in their solution.

The signs of arithmetic; +, −, ×, ÷, √, =; have the same significance in algebra as in arithmetic. The sign of multiplication is sometimes the dot written above the line, ·. In many cases the sign is not written at all.

Eg. 4 times a times b may be written $4 \times a \times b$ or $4 \cdot a \cdot b$ or $4ab$.

LETTERS USED AS NUMBERS.

In the problems of percentage and interest as well as in problems of measurement, this use of letters is often made.

The percentage equals the rate times the base. The formula is $p = r \times b$
which is written in the algebra notation as follows:

$$p = rb.$$

Interest is equal to the principle times the rate times the time. In algebra this is written:

$$i = prt.$$

The area of a circle is equal to the square of the radius times π. In algebra this is written:

$$A = \pi r^2$$

Def. A general rule written in algebraic form is called a *formula.*

In the above examples, the letter used is the first letter of the word that signifies the quantity each represents. This does not need to be the case so long as the relation is understood. Any letter may be used to represent any number or magnitude. The letters most used in actual practice are the first and last letters of the alphabet, a b c .... being used to represent

"known" or given values, and x y z .... to represent *"unknown"* or wanted values.

By the theory of equations, a formula may be changed in various ways so that any one of the quantities may be found if the others are given.

E.g. From the percentage formula, by dividing both sides of the equation by r and b, the following formulas are derived for the base and the rate respectively:

$$b = \frac{p}{r} \text{ and } r = \frac{p}{b}.$$

Def. An *algebraic expression* is a combination of figures, letters, and symbols used to represent any number or quantity.

E.g., 2a, a — b, 3ax, xy + 2.
2a is read 2 times a or simply "2 a."
a — b is read "a minus b."
3ax is read "3 a x" and means 3 times a times x.
xy + 2 is read "x y plus 2" and means that 2 is to be added to the product of x and y.

Def. The value of the number represented by an algebraic expression can not be known until the values of the various letters are determined and these values put in the original expression. The process of putting values in an expression for a certain letter or symbol is called *substitution.*

After the substitutions have been made, the indicated operations are performed. The entire process is called the *evaluation* of the expression.

EXAMPLE. If a = 2; b = 3; x = 1; y = 4: Evaluate the following expressions.

1. $2a + 3b = 2 \cdot 2 + 3 \cdot 3 = 4 + 9 = 13.$
2. $2ax - y = 2 \cdot 2 \cdot 1 - 4 = 4 - 4 = 0.$
3. $ay - bx = 2 \times 4 - 3 \times 1 = 8 - 3 = 5.$

Difficulty arises in evaluating the following problem.

$$4ax \div 2a = ?$$

If the division is performed before the values for the letters are substituted the result is 2x which with the values assumed above is equal to 2.

Substituting the values before dividing gives the following:

$$4 \cdot 2 \cdot 1 \div 2 \cdot 2 = ?$$

Here, if the multiplications are performed first, the result;

$$8 \div 4 = 2$$

is the same as that obtained by the above process. If, however, the multiplications and divisions are performed in order, as in arithmetic, the result would be

$$8 \div 2 \times 2 = 4 \times 2 = 8$$

which contradicts the result obtained by simplifying results before substituting.

In the above examples, the multiplication is always performed before the addition or subtraction. This practice must be followed at all times. In general, the order of the operations in any problem is determined by the following rule.

Order of indicated operations. *In any problem, perform all indicated multiplications first. Next perform all indicated divisions. Additions and subtractions are performed last and may be taken in any order.*

There is sometimes confusion due to the fact that in arithmetic, it is usually customary to perform multiplications and divisions in order as they occur. The change in algebra is due to the fact that it is customary to think of an expression involving only multiplications as a single number, as one writer puts it, "the multiplication is considered as being already performed."

Parentheses. Various symbols are used to indicate that several terms are to be treated as one number or to be operated on in the same way. These symbols are called the *symbols of aggregation.* The one that is used most often is the *parenthesis,* ( ). Other signs are the *bracket* [ ], the *brace,* { }, and the *vinculum* —.

3(a + b) means that the sum of a and b is to be multiplied by 3. [2a — 3x] ÷ 4a means that the difference between 2a and 3x is to be divided by 4a. $\sqrt{x^2 + 2x + 1}$ means that the square root of the sum of x^2 and 2x and 1 is to be taken.

Within a parenthesis, the rules for the order of operations applies as stated above.

For convenience, the word parenthesis is used to refer to the various signs of aggregation, brackets, braces and so forth.

While the processes used in algebra have not yet been considered, a comparison of the solution of a problem as worked in arithmetic and as worked in algebra will serve to show the nature of the latter method.

Problem. The area of the surface of a cube is 486 sq. ft. Find the length of one edge.

Solution. Let x = length of edge.
Then x^2 = area of one face.
Since there are 6 faces to a cube, the total area = $6x^2$.
Hence, $6x^2 = 486.$
Dividing by 6, $x^2 = 81.$
Transposing $x^2 - 81 = 0.$
Factoring, $(x + 9)(x - 9) = 0.$

Setting each factor equal to zero gives $x = \pm 9$ = one edge. The root, —9, has no significance as an edge of a cube.

The arithmetical solution of this problem follows the same outline as the above. It is as follows:

If the area of the whole cube is 486 sq. ft., the area of one face is one-sixth of 486 or 81 sq. ft. Each side of a cube is a square, hence the edge of the cube which is equal to a side of this square is equal to the square root of 81 or 9 ft.

In many of the problems of arithmetic, the algebraic method serves simply to write the arithmetic solution in better form.

Problem. A train leaves Pittsburgh for New York at 8:00 A. M. travelling at the rate of 30 miles per hour. Three hours later, a second train starts in the same direction from Pittsburgh travelling at the rate of 40 miles per hour. When and where will the second train overtake the first?

ARITHMETICAL SOLUTION. The first train travelling at the rate of 30 miles per hour will have gone 3 × 30 = 90 miles when the second train starts.

The second train will gain 40 — 30 = 10 miles per hour on the first train after it starts.

The number of hours it will take for the second train to gain 90 miles at 10 miles per hour is given by 90 ÷ 10 = 9 hours.

Hence the first train will travel 3 + 9 = 12 hours, when it will be 8:00 P. M.

The trains will at that time be 12 × 30 = 360 miles from Pittsburgh.

ALGEBRAIC SOLUTION.

Let t = number of hours after 8:00 A. M.
30t = miles travelled by first train, t hours after 8:00.
t — 3 = hours the second train is running.
40 (t — 3) = miles travelled by second train t hours after 8:00 A. M.

The trains will be together when the expressions which represent the distances they each have travelled are equal.

Hence $30t = 40\ (t - 3)$
$= 40t - 120$
$-10t = -120.$

Dividing both sides of the equation by -10, gives

$t = 12$. hrs., after 8:00 A. M. which means that they are together at 8:00 P. M.

$30t = 360$ miles distance each train has travelled.

In the algebraic solution, $40t$ was subtracted from $30t$. the answer was written $-10t$. In the next step, each side of the expression was divided by -10. Up to this point in our study of numbers, both of these operations are impossible. This problem will now be considered.

POSITIVE AND NEGATIVE NUMBERS.

There are many situations in which the numbers of arithmetic are cumbersome. An elaborate explanation is often necessary to indicate what a number really means. A few examples of this nature will indicate the meaning of this statement.

New York and Chicago are each about 440 miles from Pittsburgh via the Pennsylvania Railroad. It is customary to speak of New York as being 440 miles east of Pittsburgh and Chicago as being 440 miles west of Pittsburgh.

In describing the motion of a ball thrown from the top of a building, it is necessary to tell whether the ball is above or below the place from which it was thrown.

In telling about the temperature on a certain day or place, one says it was a certain number of degrees above or below zero. The thermometer is marked off in degrees above and below a point called zero.

In deciding the financial condition of a firm or of an individual, the total assets and the total liabilities of the concern are considered. If the amount of the assets is greater than the liabilities, the balance is considered as credit or surplus. On the other hand, if the liabilities are the greater, the difference between the two items is called the debt or deficit.

Many other examples might be sighted where it is desirable to have some agreement that will indicate the significance of various numbers.

In mathematics, this is accomplished by calling one set of numbers *positive* and the other set *negative*. The conventions that determine which of the opposite numbers is called positive and which negative are rather well defined.

Distance east is usually called positive, west is called negative. Distance north is positive, south is negative.

Distance upward or to the right is called positive, downward or to the left is called negative.

Temperature above zero is positive, below zero is negative.

Assets and surplus are represented by positive numbers. Liabilities and deficits are represented by negative numbers.

Motion is positive if it takes place in a positive direction, negative if it takes place in a negative direction. It is generally agreed that positive rotation shall be opposite to the motion of the hands of a clock or counter-clock-wise. Motion around a point in the same direction as the hands of a clock is called negative.

The sign $+$ is used to indicate positive numbers and is read plus or positive. The sign $-$ is used to designate negative numbers and is read minus or negative. When no sign is written, the positive sign is always understood.

Def. Positive and negative numbers are also called *signed numbers* or *directed numbers*. The reason for the second name will appear below.

Graphical representation of directed numbers. If a point is taken on a line and distances are measured off to the right corresponding to the various units, as in the accompanying figure,

any positive number can be represented by some point to the right of the zero point.

Positive numbers are the numbers of arithmetic. To add two positive numbers on the scale, as $2 + 3 = 5$, from the point 2 count 3 places to the right arriving at the point 5. Notice that in this process, the counting is to the right or in the direction in which the positive numbers are measured.

To subtract two positive numbers on the scale, as $7 - 3 = 4$, from the point 7 count 3 places to the left arriving at the point 4. Notice that in this process the counting is to the left or in the opposite direction from that in which the positive numbers are measured.

If distances are measured off to the left of the zero, each point will have a certain distance from the point 0. The sign $-$ is placed before the numbers which represent these distances. *The points are said to represent the negative numbers graphically.*

The ideas of addition and subtraction of positive numbers are extended to include addition and subtraction of directed numbers.

Multiplication is an extended form of addition while division is the inverse process of multiplication. The graphical method of performing these operations is explained below.

Def. The *absolute value* of a signed number is the value of the number considered as positive regardless of the sign of the number.

E.g. The absolute value of -3 is 3; of $+4$ is 4; of -5 and $+5$ is 5; of $-a$ is a; etc.

For purposes of reference, the rules for performing the fundamental operations on signed numbers are stated below. The various operations will then be considered separately.

Rules for combining signed numbers.

1. Addition. To add two numbers of like sign, that is, two positive or two negative numbers, find the sum of their absolute values and prefix their common sign to the result.

To add two numbers of unlike signs, that is a positive and a negative number, find the difference between their absolute values and prefix the sign of the number having the greater absolute value to the result.

2. Subtraction. To subtract one signed number from another, change the sign of the subtrahend and add the resulting number to the minuend.

3. Multiplication. To multiply two signed numbers, find the product of their absolute values. This product is positive if the numbers being multiplied have like signs. It is negative if the numbers have unlike signs.

4. Division. To divide two signed numbers, find the quotient of their absolute values. This quotient is positive if the divisor and dividend have like signs. It is negative if they have unlike signs.

Addition of signed numbers. To add a positive number, one counts forward or to the right from a given number. To add a negative number, one counts backward or to the left from a given number.

To add −4 to +6, count from 6, 4 to the left, getting 2.
To add −4 to −6, count from −6, 4 to the left, getting −10.
To add +4 to −6, count from −6, 4 to the right, getting −2.

In adding two numbers which are opposite in sign but which have the same absolute value, one arrives at the zero point on the line. In this case the sum is called zero, and the numbers are said to cancel each other.

Def. The sum of two signed numbers is called the *algebraic sum* of the numbers. It is immediately evident that the algebraic sum of two signed numbers is often different from the value of the sum of their absolute values.

In algebra, to add means to find the algebraic sum.

Subtraction of signed numbers. To find the difference between two numbers means to find the number which must be added to the subtrahend to give the minuend. On the directed line, this corresponds to finding the number of units from the subtrahend to the minuend, indicating the direction of the counting by a plus sign if it is to the right and by a minus sign if it is to the left.

This process may be simplified by starting from the minuend and counting as many places as are indicated in the subtrahend, in the opposite direction to that indicated by the sign of the subtrahend. This means that in subtracting a positive number, one counts to the left; and in subtracting a negative number one counts to the right.

To subtract +5 from +8, count 5 to the left from 8 getting +3.
To subtract +8 from +5, count 8 to the left from 5 getting −3.
To subtract −5 from +8, count 5 to the right from +8 getting +13.
To subtract −5 from −8, count 5 to the right from −8 getting −3.

The advantage of this second method lies in the fact that the number reached on the scale is the answer required.

It will be noticed that this process is the same as changing the sign of the subtrahend and then adding algebraically.

By the use of signed numbers, it is possible to find the difference between any two signed numbers. This is a distinct advantage over the work in arithmetic where many problems can only be solved by the aid of a great deal of explaining of terms.

Def. The difference between two signed numbers is called the *algebraic difference* between them.

Multiplication of signed numbers. The idea of multiplication must be extended to take care of this larger number system. Four cases exist. Both numbers may be positive. Both may be negative. The multiplier may be positive and the multiplicand negative. The multiplier may be negative and the multiplicand positive. These cases will be considered in turn.

1. $+3 \times +5 = +15$.

This is the problem of arithmetic. It means that +3 is to be taken or added 5 times.

$$(+3) + (+3) + (+3) + (+3) + (+3) = 15.$$

2. $-3 \times +5 = -15$.

This means that −3 is to be added 5 times.

$$(-3) + (-3) + (-3) + (-3) + (-3) = -15.$$

3. $+3 \times -5 = -15$.

This means that +3 is to be subtracted 5 times.

$$-(+3) - (+3) - (+3) - (+3) - (+3) = -15.$$

4. $-3 \times -5 = +15$.

This means that −3 is to be subtracted 5 times.

$$-(-3) - (-3) - (-3) - (-3) - (-3) = +15.$$

since to subtract −3 is the same as adding +3.

Multiplication means addition when the numbers are positive and subtraction when the numbers are negative.

Cases 1 and 4 are covered by the first part of the rule for multiplication while cases 2 and 3 are covered by the second part.

Division of signed numbers. Division may be thought of as the inverse of the process of multiplication. The dividend corresponds to the product, the divisor to one of the factors of the product. The problem is to find the other factor. This is the quotient. Hence the signs of the quotient are determined by the considerations set forth in connection with multiplication. Notice that one of the three numbers is always positive. Also, that if one number is negative one of the others will be negative.

If the dividend and divisor have like signs, the quotient is positive.

$$(+24) \div (+4) = +6.$$
$$(-21) \div (-7) = +3.$$

If the dividend and divisor have unlike signs, the quotient is negative.

$$(+18) \div (-3) = -6.$$
$$(-27) \div (+9) = -3.$$

Zero. The introduction of the number zero in the number system presents a special case. No difficulty arises in addition and subtraction. Multiplying any number by zero always gives zero as a result. Division by zero leads to many contradictions, such as $2 = 1$, and so on. For this reason, *division by zero is not permitted in mathematics.*

ALGEBRAIC EXPRESSIONS.

Def. The factors of an algebraic expression are those numbers or expressions which multiplied together give the original expression.

E.g. 12axy has the factors 2, 2, 3, a, x, and y.

The reader should notice that the definitions and processes of algebra will always include those already worked out for arithmetic. This is true because the number system of algebra includes the number system of arithmetic and no rules or processes can be introduced in algebra that will conflict with the laws and principles of arithmetic. In the above example, the factors of the numerical part of the number are found by the methods of arithmetic.

Def. When an algebraic expression is the product of two or more numbers, either of the numbers may be called the *coefficient* of the other

in the product. The coefficient indicates how many times the other number is taken in the expression.

E.g. In the term, $4ax$, 4 may be called the coefficient of ax; $4a$ may be called the coefficient of x; a may be called the coefficient of $4x$; etc.
It is customary to think of the coefficient as being composed of arithmetical numbers and those algebraic numbers represented by the first letters of the alphabet.

When a coefficient is composed only of arithmetical numbers it is called a *numerical coefficient*. When it is composed only of letters, it is called a *literal coefficient*. When the coefficient contains both arithmetical numbers and letters, it is called a *mixed coefficient*.

E.g. In the expression $15x$, 15 is a numerical coefficient.
In the expression ay, a is a literal coefficient.
In the expression $\frac{1}{2}ax$, $\frac{1}{2}a$ is a mixed coefficient.

Def. When a factor occurs more than once in an algebraic expression, the number of times it occurs is indicated by a small number written to the right and a little above the number. These numbers are called *exponents*. The factor is said to be raised to the power indicated by the exponent. When the exponent is not written, 1 is always understood.

E.g. $2aaa = 2a^3$; $3axx = 3ax^2$.

Any kind of number may be used as an exponent.

Def. An algebraic expression which involves only the idea of multiplication of arithmetical numbers and letters is called a *term*. As a special case, all numbers of arithmetic are considered as single terms if they stand alone or are separated from the rest of an expression by plus or minus signs.

E.g. 20, $3ax$, $4bxy$, are examples of terms.

Def. A *monomial* is an algebraic expression of a single term.

E.g. 10; $5ax$; $\frac{1}{4}xy$.

Def. An algebraic expression made up of the sum and difference of algebraic terms is called a *polynomial*.

E.g. $2a + 3b - c$; $x^2 + 2x + 1$.

Def. A polynomial of two terms is called a *binomial*.

E.g. $a + b$; $2x - 3y$.

Def. A polynomial of three terms is called a *trinomial*.

E.g. $a + b - c$; $x^2 - 4x - 5$.

Def. A *root* of an algebraic number is one of the equal factors whose product gives the number. This is the same idea as that developed in arithmetic. The symbol used is also the same.

E.g. $\sqrt{9} = 3$; $\sqrt{4a^2} = 2a$; $\sqrt[3]{27x^3} = 3x$.

Def. Two or more terms are said to be *similar* if they have the same literal factors. In other words, they differ only in their numerical coefficients. This name is sometimes applied to terms having any common factor but the advantages of this more general definition are not great.

E.g. $2a$ and $5a$ are similar terms since they have the common factor a. Under the definition, $2x$ and $3xy$ are not similar since their literal parts are not the same.

Def. A number or algebraic expression which has no factors is called a *prime number*.

The prime numbers of arithmetic are also prime in algebra. $3a$ is not prime since it has the factors 3 and a. $a + b$ and $2x - y$ are prime numbers since they have no factors.

It is often important to know if a number is factorable or not. From the definition, a prime number is not factorable.

The simplest kind of algebraic expression is the monomial or term. Next to this is the combination of several terms called polynomials. The elementary operations on these numbers, i.e., addition, subtraction, multiplication and division, will now be considered.

ADDITION.

MONOMIALS.

1. To add similar terms.

In arithmetic, only like numbers can be added. In algebra, this rule takes the following form.

Rule. To add similar terms, find the algebraic sum of the numerical coefficients and prefix this result to the common factor.

EXAMPLE. Add $12a$, $-4a$ and $+a$.

$$\begin{array}{r} +12a \\ -4a \\ +a \\ \hline +9a \end{array}$$

The algebraic sum of $+12-4+1=9$. This is to be written before the common factor a.

2. To add dissimilar terms.

This can only be indicated by writing the terms one after another, giving to each its proper sign. The result of the sum of several dissimilar terms is a polynomial. See definition above.

EXAMPLE. Add x^2, $3x$, and -4.
Since these terms are dissimilar, write the sum as
$$x^2 + 3x - 4.$$

These terms may be written in any order but it is customary to write the letters of the alphabet that come first ahead of those that come later. Also, if different powers of the same letter are present in the expression, the terms should be arranged in ascending or descending powers of the letter.

E.g. The expression $-2b - 3c + a$ would be written
$$a - 2b - 3c$$
while $4x - x^2 + x^3 - 10$ is usually arranged as follows:
$$x^3 - x^2 + 4x - 10.$$

POLYNOMIALS.

In adding two or more polynomials, the similar terms are added together as in the case of monomials and the dissimilar terms are written after these sums giving to each term its proper sign.

In practice the process is much simplified by the following plan.

Rule. Write the polynomials under each other, arranging the terms so that similar terms will all be in the same column. Find the algebraic sum of each column, writing the results

of each such addition at the bottom of the column added with their proper signs.

EXAMPLE. Add $7x - y + 3z$, $6y - 2z$, $3x - 4y - 3z$.

$$\begin{array}{rl} 7x - y + 3z & \\ 6y - 2z & \text{Addends.} \\ 3x - 4y - 3z & \\ \hline 10x + y - 2z & \text{Sum.} \end{array}$$

To check an operation in algebra. The letters used in problems may represent any number. Hence the result obtained by any of the various processes must be true if *any* value is substituted for the letters involved. The following general method will furnish a rapid and accurate check on all algebra operations.

Assign values to the various letters involved in the problem. Evaluate each of the expressions entering in the problem. Perform the indicated operations on these values. The result must be the same as that obtained by evaluating the results of the algebraic process.

E.g. In the above problem, let $x = 1$, $y = 2$, and $z = 3$

$$\begin{array}{rlll} 7x - y + 3z = & 7 - 2 + 3\cdot 3 = & 7 - 2 + 9 = & 14 \\ 6y - 2z = & 6\cdot 2 - 2\cdot 3 = & 12 - 6 = & 6 \\ 3x - 4y - 3z = & 3 - 8 - 9 = & & -14 \\ \hline 10x + y - 2z = & 10 + 2 - 6 = 6 & & = 6 \end{array}$$

Check.

The same value may be used for more than one of the letters. It simplifies the work to use small numbers as much as possible. *It is important to always check the result of any mathematical process.* In important applications of this subject, results are checked and rechecked. An error may often cause the loss of money or of life. Form the habit of checking all results as the problem is worked. The time taken will be well spent. With experience, many short cuts will suggest themselves to the thinking student. The number 1 is most often used where the exponents are of the first degree only. If some of the letters are squared or raised to higher powers, 2 will give a surer test.

SUBTRACTION.

MONOMIALS.

Since the numbers of algebra are signed numbers, the methods for subtracting signed numbers explained above apply for monomials.

Rule. To subtract one term from another, change the sign of the subtrahend and add the resulting number to the minuend.

If the terms are similar, the difference will be the term formed by writing the algebraic difference of the coefficients as the coefficient of the common literal part.

EXAMPLE. Subtract $-4ax$ from $-2ax$.

By the rule this is equivalent to adding $+4ax$ to $-2ax$.

$$\begin{array}{rl} -2ax & \\ --4ax & \text{Change signs, then add.} \\ \hline & +2ax \end{array} \qquad \begin{array}{r} -2ax \\ +4ax \\ \hline +2ax \end{array}$$

If the terms are not similar, the subtraction can be indicated by writing the terms, the sign of the subtrahend being changed.

EXAMPLE. Subtract $4ax$ from $5by$.

Change the sign of $4ax$, getting $-4ax$. Write the difference as follows:

$$5by - 4ax.$$

POLYNOMIALS.

Rule. To subtract one polynomial from another, write the subtrahend below the minuend so that similar terms are in the same columns.

Change the signs of all terms in the subtrahend.

Find the algebraic sum of each column, writing the results below each column with their proper sign.

EXAMPLE. Subtract $3x - y + 4z$ from $7x + 2y - 6z$.

Solution. Check with $x = 1$, $y = 1$, $z = 1$.

$$\begin{array}{rlll} 7x + 2y - & 6z = 7 + 2 - & 6 = & 3 \\ 3x - & y + & 4z = 3 - 1 + & 4 = 6 \\ \hline 4x + 3y - & 10z = 4 + 3 - 10 = & -3 & \text{Check.} \end{array}$$

The change of sign is made mentally.

EQUATIONS.

The third new idea developed in algebra is the theory of equations. It has already appeared that the use of letters furnishes a simple and concise method of treating many of the rules of arithmetic. In the study of equations, one learns how to use these formulas as well as many other relations in the solution of practical problems.

Def. An *equation* is a statement of equality between two algebraic numbers.

E.g. $2a - 3 = a + 6$.

Def. An *identity* is an equation which is true for any values that may be assigned to the letters involved.

E.g. $2\cdot 3 - 4 = 7 - 10/2$ is an identity in which only numerical values are involved since the expression on each side of the equality sign reduces to 2.

$2x + 3 = 4x - 6 - 2x + 9$ is an identity since the expression on the right of the equality reduces to the expression on the left when similar terms are combined as indicated.

Def. An *equation of condition* is an equation which is true for certain values of the letters involved.

Def. Letters which represent values which are to be determined are called *unknowns*.

Def. Any value of an unknown which reduces the equation to an identity is called *a root* of the equation. Such a value is said to satisfy the equation.

E.g. 4 is a root of the equation $2x + 3 = 11$ since when 4 is substituted for x the equation becomes $11 = 11$.

Def. The part of an equation on the left of the equality sign is called the *left hand member*; that on the right is called the *right hand member*.

Def. A *simple equation* is an equation in which only the first power of the unknown occurs. Such an equation is said to be of the first degree in the unknown.

E.g. $2x - 3 = x + 6$ is a simple equation.

Def. To solve an equation is to find the roots of the equation.

Axioms. In dealing with equations, certain statements are assumed as true without proof. Their truth is so obvious that it is said to be self evident. Such statements are called *axioms*.

Each axiom will be illustrated by an example illustrating its use.

1. If equals are added to equals, the results are equal.

2. If equals are subtracted from equals, the results are equal.

3. If equals are multiplied by equals, the results are equal.

4. If equals are divided by equals, the results are equal.

5. Things equal to the same thing are equal to each other.

EXAMPLE. 1. Solve the equation $x - 4 = 3$.

By axiom 1, the same number can be added to the members of this equation without affecting the equality.

Adding 4 to each member, gives

$$x - 4 + 4 = 3 + 4$$

or $$x = 7$$

which is the required solution.

EXAMPLE. 2. Solve the equation $x + 6 = 3$.

By axiom 2, the same number can be subtracted from each member of this equation without affecting the equality.

Subtracting 6 from each member, gives

$$x + 6 - 6 = 3 - 6$$

or $$x = -3$$

which is the required solution.

EXAMPLE. 3. Solve the equation $\frac{1}{2}x = 3$.

By axiom 3, each member of this equation can be multiplied by the same number without affecting the equality.

Multiplying each member by 2, gives

$$2 \cdot \tfrac{1}{2}x = 2 \cdot 3,$$

or $$x = 6,$$

which is the required solution.

EXAMPLE. 4. Solve the equation $3x = 15$.

By axiom 4, each member of this equation can be divided by the same number without affecting the equality.

Dividing each member by 3, gives

$$\frac{3x}{3} = \frac{15}{3}$$

or $$x = 5,$$

which is the required solution.

In examples 1 and 2 above, the numerical value in the left member is moved to the right member where it appears with the opposite sign. This may be done with any term of either member.

Rule. A term may be transposed from one member of an equation to the other by changing the sign of the term.

E.g. The equation $2x - 3 = x + 5$ may be written

$$2x - x = 5 + 3$$

by transposing x from the right to the left member and -3 from the left to the right member.

Equations are useful in solving problems. They furnish a convenient and brief method for explaining the solution. Any kind of an algebraic expression may occur in the solution of various problems. In connection with the various forms and operations, problems will be solved illustrating the various methods. Whenever it is practicable, the problems used for purposes of illustration will be drawn from the experience of the pupil.

Problem. The sum of two numbers is 55 and difference is 17. What are the numbers.

Solution. Let x = one number.

$x + 17$ = the other number.

Since the sum of the two numbers is 55,

$$x + x + 17 = 55.$$

Transpose the 17 to the right hand member, and combine the x's.

$$2x = 55 - 17$$
$$= 38.$$

Divide each member by 2.

$x = 19$, one number.

$x + 17 = 36$, the other number.

To check the solution. See that the numbers found actually satisfy the conditions of the problem.

Here $19 + 36 = 55$, and $36 - 19 = 17$. Check.

By studying the above type solution, the steps in the process will appear as follows.

1. A study of the problem to determine what quantity will serve best as the unknown in the problem.

2. Represent this quantity by some letter, as x, and express all other quantities in terms of this letter.

3. Combine these expressions into an equation which expresses the conditions stated in the problem.

4. Solve this equation for the unknown and find the other required values by substitution.

5. Always check the results by testing to see that they actually satisfy the conditions of the problem. It is not enough to substitute in the equation as this may have been formed incorrectly.

PARENTHESES.

Problems in addition and subtraction of polynomials are written in convenient form by the aid of the signs of aggregation.

E.g. To write out a problem showing that $2x - 3y$ is to be added to $3x + y$, proceed as follows.

$$2x - 3y + (3x + y) = 2x - 3y + 3x + y$$
$$= 5x - 2y$$

Rule. Parentheses preceded by the sign + may be removed without any change in the signs of the terms within them.

E.g. To write out a problem showing that $3x + y$ is to be subtracted from $2x - 3y$, proceed as follows:

$$2x - 3y - (3x + y) = 2x - 3y - 3x - y$$
$$= -x - 4y$$
$$= -(x + 4y).$$

Rule. Parentheses preceded by the sign − may be removed by changing each term within them.

In many problems, one sign of aggregation may be contained within another. In problems of this sort the following procedure is to be followed.

Rule. Rewrite the expression, removing the inner parenthesis, giving to each term its proper sign in accordance with the above rules.

Repeat this process till all the parentheses are removed.

If, at any time, similar terms occur in the inner parenthesis, they should be combined by the rules for addition and subtraction.

EXAMPLE. Remove parentheses and simplify

$$2x - \{2(x-1) + [x - (2x-1)]\} = 2x - \{2x - 2 + [x - 2x + 1]\}$$
$$= 2x - \{2x - 2 + [-x + 1]\}$$
$$= 2x - \{2x - 2 - x + 1\}$$
$$= 2x - \{x - 1\}$$
$$= 2x - x + 1$$
$$= x + 1$$

To place a parenthesis around several terms in an expression. The principles that govern this procedure are the converse of the rules for removing parenthesis.

Rule. Two or more terms may be inclosed in a parenthesis preceded by a plus sign, +, without changing the signs of any of the terms.

Two or more terms may be inclosed in a parenthesis preceded by a minus sign, −, provided the sign of every term inclosed in the parenthesis is changed.

EXAMPLE. $2a - 3b + c - 2d = 2a - 3b + (c - 2d)$
$= 2a - (3b - c + 2d)$

In this connection, it should be noticed that the sign of the first term in a parenthesis is positive unless the minus sign is written before it. In the example, the sign of 3b was minus originally but in the second case it is changed to plus within the parenthesis in accordance with the above rule.

MULTIPLICATION.

In addition, it was assumed without further remark, that the terms may be arranged and combined in any desired order. A similar assumption is necessary in multiplication. The laws governing this are called the commutative and associative laws of numbers.

The *commutative law* states that terms of a sum or the factors of a product may be combined in any order.

E.g. $a + b = b + a$, and $ab = ba$.

The *associative law* states that the terms of a sum or the factors of a product may be grouped together in any combination.

E.g. $a + b + c = (a + b) + c = a + (b + c)$.
$abc = a(bc) = (ab)c$.

Besides these general laws which have to do with the theory of numbers in general, the following rules are used in multiplying algebraic expressions.

Law of signs. In multiplying two terms, the sign of the product is + if the terms have like signs, and − if they have unlike signs.

Law of coefficients. In multiplying two terms, the coefficient of the product is equal to the product of the coefficient of the terms.

Law of exponents. In multiplying two terms, the exponent of each letter in the product is equal to the sum of the exponents of that letter in the given terms.

These rules or laws are all that is needed to enable one to multiply monomials.

EXAMPLE. 1. $6ax \times 5by = 6ax5by$
$= 6 \cdot 5\ abxy$
$= 30\ abxy.$

EXAMPLE. 2. $4ax\ (-3by) = -4 \cdot 3\ axby$
$= -12\ abxy.$

EXAMPLE. 3. $(-2ax)(-3ax^2) = 2 \cdot 3\ a \cdot a\ x \cdot x^2$
$= 6a^2x^3.$

Polynomials.

To multiply a polynomial by a monomial, multiply each term of the polynomial by the monomial and write the resulting products in any order with their proper sign.

EXAMPLE. Multiply $7x^2 - 5$ by $-4x^2$.

Solution. Check, using $x = 1$.

$7x^2 - 5$	$= 7 - 5$	$= 2$
$-4x^2$	$= -4$	$= -4$
$-28x^4 + 20x^2$	$= -28 + 20 = -8$	Check.

Rule. To multiply a polynomial by a polynomial, multiply one polynomial by each term of the other and add the partial products.

In work of this kind, it is customary to arrange the two polynomials in the same order, i.e., in ascending or descending powers of the same letter. Then write the partial products under each other, letting similar terms fall under each other. In this way, the final product will also be arranged in the same order as the factors.

EXAMPLE. Multiply $-x^2 + 3x^3 - 5x - 1$ by $1 - x$.

Solution. Write in descending powers of x.

$$3x^3 - x^2 - 5x - 1$$
$$-x + 1$$
$$-3x^4 + x^3 + 5x^2 + x \quad \text{Partial Product}$$
$$+ 3x^3 - x^2 - 5x - 1 \quad \text{Partial Product}$$
$$-3x^4 + 4x^3 + 4x^2 - 4x - 1 \quad \text{Product.}$$

Check using $x = 1$.
First factor $= 4$.
Second factor $= 0$.
Product $= 0$ $\quad 4 \times 0 = 0$.

When one of the factors equals zero, it is a good plan to try some other number for x.

Check using $x = 2$.

$$3x^3 - x^2 - 5x - 1 = 3 \cdot 8 - 4 - 5 \cdot 2 - 1$$
$$= 24 - 4 - 10 - 1$$
$$= 9.$$
$$-x + 1 = -2 + 1 = -1$$
Multiply $9(-1) = -9$
$$-3x^4 + 4x^3 + 4x^2 - 4x - 1 = -48 + 32 + 16 - 8 - 1$$
$$= -9 \quad \text{Check.}$$

There are many special rules for multiplying certain expressions. These are explained in the sections following the work on division.

Problem. A carpet has its length five feet longer than its width. The room in which it is placed is 3 feet longer and 3 feet wider than the rug. The floor of the room contains 96 square feet more area than the carpet. What is the size of the carpet?

SOLUTION.

Let x = the width of the carpet.
Then, $x + 5$ = the length of the carpet.
$x(x + 5)$ = area of the carpet.
$x + 3$ = the width of the room.
$x + 8$ = the length of the room.
$(x + 3)(x + 8)$ = area of the room.

From the problem.
$(x + 3)(x + 8) - x(x + 5) = 96$.

Multiplying out and collecting similar terms,
$$6x + 24 = 96.$$
Transposing,
$$6x = 96 - 24 = 72.$$
$$x = 12, \text{ width of carpet.}$$
$$x + 5 = 17, \text{ length of carpet.}$$

To check this result, notice that $12 \times 17 = 204$; while $15 \times 20 = 300$. The difference is 96 as given.

DIVISION.

Division is the reverse of multiplication. The three special laws for multiplication have corresponding statements in division.

Law of signs. In dividing two terms, the sign of the quotient is + if the divisor and dividend have like signs, and − if they have unlike signs.

Law of coefficients. In dividing terms, the coefficient of the quotient is the quotient of the coefficients of the terms.

Law of exponents. In dividing terms, the exponent of each letter in the quotient is equal to the difference found by subtracting the exponent of the letter in the divisor from its exponent in the dividend.

MONOMIALS. In finding the quotient of two monomials, the work is simplified by writing the terms in the form of a fraction as in arithmetic. Factors common to the two terms may then be cancelled and the exponents of each letter may be combined.

EXAMPLE. Divide $12a^2x^3y$ by $3ax^2y$.

$$\frac{\overset{4}{\cancel{12}a^{\cancel{2}}x^{\cancel{3}}\cancel{y}}}{\underset{a}{\cancel{3}}\cancel{x^2y}} = \frac{4a^2x^3}{ax^2} = 4ax$$

Zero and negative exponents.

Division of monomials presents some interesting problems. If the law of exponents is to always apply, some new definitions are necessary. This can best be seen by studying the following cases.

1. Divide x^3 by x^3.

In arithmetic, it is stated that anything divided by itself is equal to 1. If the rule for division stated above is followed, a new expression is found.

$$\frac{x^3}{x^3} = x^{3-3} = x^0$$

Now x to the zero power has not been defined. The value of the expression is determined by the above considerations.

The following principle may therefore be stated.

Any number raised to the zero power is equal to 1.

2. Divide x^2 by x^5.

In arithmetic, when one number is greater than another, the quotient is indicated by a fractional form. This form is always reduced to its lowest terms. Proceeding in this manner, cancelling x^2 from both terms, the quotient would be written.

$$\frac{x^2}{x^5} = \frac{1}{x^{5-2}} = \frac{1}{x^3}$$

If the rule for exponents in division is followed, another expression is found.

$$\frac{x^2}{x^5} = x^{2-5} = x^{-3}$$

Up to the present x to a negative power has had no meaning. It is important to realize that any meaning can be assigned to this expression that does not contradict previous work. Two forms have been found for the above quotient. The assumption made should be such as to recognize this agreement.

The following principle may therefore be stated.

Any number raised to a negative power is equal to 1 divided by that same number raised to the same positive power.

E.g. $\frac{1}{x^3} = x^{-3}$; $a^{-1} = \frac{1}{a}$.

The theory of exponents is considered in detail after other topics of algebra are developed. It is shown there that an exponent may be any kind of number. Hence, as in our number system in both arithmetic and algebra, the rules under which exponents may be added, subtracted, multiplied, and divided are studied. The most practicable method of computation, namely logarithms, is an application of this theory.

For the present, negative and zero exponents are to be used only as a convenient notation in writing numbers.

EXAMPLE. Divide x^2yz^2 by xy^2z^6, and simplify.

$$\frac{x^2yz^2}{xy^2z^6} = x^{2-1}\,y^{1-2}\,z^{2-6} = xy^{-1}\,z^{-4} = \frac{x}{yz^4}$$

Check, using $x = 2$, $y = 2$, $z = 2$.

$$x^2yz^2 = 2^2 \cdot 2 \cdot 2^2 = 32 \qquad \frac{32}{512} = \frac{1}{16}$$

$$xy^2z^6 = 2 \cdot 2^2 \cdot 2^6 = 512$$

$$xy^{-1}z^{-4} = 2 \cdot 2^{-1} \cdot 2^{-4} = \frac{2}{2 \cdot 2^4} = \frac{1}{16} = \text{Check.}$$

POLYNOMIALS.

To divide a polynomial by a monomial, divide each term of the polynomial by the monomial and write the resulting quotients in any order with their proper sign.

EXAMPLE. Divide $6x^3 - 9x^2 + 3x$ by $3x$.

Solution.

$$\frac{6x^3 - 9x^2 + 3x}{3x} = \frac{6x^3}{3x} - \frac{9x^2}{3x} + \frac{3x}{3x} = 2x^2 - 3x + 1$$

Check, using $x = 2$.

$$\frac{48 - 36 + 6}{6} = 3$$

$$= 8 - 6 + 1 = 3 \text{ Check}$$

To divide a polynomial by a polynomial. The rule will be understood more readily by considering the following example.

EXAMPLE. Divide $x^3 + 65xy^2 - 15x^2y - 63y^3$ by $x - 7y$

Writing the dividend in descending powers of x, the problem solved as follows:

Dividend $x^3 - 15x^2y + 65xy^2 - 63y^3$ | $x - 7y$ = Divisor.

$x^3 - 7x^2y$ | $x^2 - 8xy + 9y^2$ = Quotient

$- 8x^2y + 65xy^2$

$- 8x^2y + 56xy^2$

$+ 9xy^2 - 63y^3$

$+ 9xy^2 - 63y^3$

The first term of the quotient is obtained by dividing the first term of the dividend by the first term of the divisor, $x^3 \div x = x^2$. The first partial product ($x^3 - 7x^2y$) is obtained by multiplying the entire divisor by this term. The partial product is written below the dividend with similar terms below each other, and then subtracted from the dividend. All terms of the dividend may not need to be rewritten or brought down but they are all included in the remainder after the subtraction.

The second term in the quotient is obtained by dividing the first term of this remainder by the first term of the divisor, $-8x^2y \div x = -8xy$. The next partial product is obtained by multiplying the divisor by this term. This partial product is subtracted from the remainder and the process is repeated.

In this way the third term in the quotient is $+ 9y^2$.

After this operation, there is no remainder. Hence, the divisor is a factor of the dividend. So is the quotient.

If a remainder is present, and further division with positive exponents is impossible, the remainder is written over the divisor in the form of a fraction and added to the quotient.

To check the above problem, let $x = 1$, and $y = 1$.

Dividend $= 1 - 15 + 65 - 63 = -12$

Divisor $= 1 - 7 = -6$

$$-12 + -6 = \frac{-12}{-6} = 2.$$

Quotient $= 1 - 8 + 9 = 2$ Check.

Here 1 may be used to advantage in checking the result since the exponents are easily seen to be correct. A little experience with problems of this kind will enable one to see that the quotient is always arranged in the same order as the dividend and divisor, in this case in descending powers of x.

The above process is very similar to that used in long division in arithmetic. In fact, the method of arithmetic is proved by this work here. The reason for the various steps becomes evident if the divisor is multiplied by the quotient. The result, of course, must be the dividend.

$x - 7y$ = Divisor
$x^2 - 8xy + 9y^2$ = Quotient.

$x^3 - 7x^2y$ First partial product.
$- 8x^2y + 56xy^2$ Second partial product.
$+ 9xy^2 - 63y^3$ Third partial product.

$x^3 - 15x^2y + 65xy^2 - 63y^3$ Product or dividend.

The first term of each partial product is the product of the first term of the divisor and a term of the quotient.

Rule for division by polynomials.

1. Arrange both dividend and divisor in ascending or descending powers of some letter.

2. Divide the first term of the dividend by the first term of the divisor, writing the result as the first term of the quotient.

3. Multiply all terms of the divisor by the term so found, and subtract the resulting partial product from the dividend.

4. If there is a remainder, consider it as a new dividend and proceed as before, i.e. divide the first term of this expression by the first term of the divisor, writing the result as the first term of the quotient.

5. If there is a remainder and division is no longer possible without using fractions or negative exponents, write this expression over the divisor in the form of a fraction and add it to the quotient.

Problem. The distance from New York to Pittsburgh is 440 miles. A train leaves Pittsburgh for New York travelling 30 miles per hour at the same time that a train leaves New York for Pittsburgh travelling 25 miles per hour. When and where will they meet?

Solution.

Let x = distance from Pittsburgh to any point.
Then $440 - x$ = distance from New York to same point.

$\frac{x}{30}$ = hours the first train takes to get to x.

$\frac{440 - x}{25}$ = hours the second train takes to get to x.

If the trains meet at x, the two times will be equal.

Hence, $$\frac{x}{30} = \frac{440 - x}{25}$$

Multiplying both sides of the equation by 30×25,

$$\frac{30.25x}{30} = \frac{30.25\ (440 - x)}{25}$$

Or $$25x = 30\ (440 - x)$$
$$= 13200 - 30x$$

Transposing, and solving,
$25x + 30x = 13200$
$55x = 13200$
$x = 240$ Miles from Pittsburgh.

$\frac{x}{30} = \frac{240}{30} = 8$ Number of hours till the trains meet.

To check, notice that one train goes 240 miles in 8 hours and that the other goes 200 miles in the same time. Their sum is 440 miles or the total distance.

Problem. A and B start from two towns 144 miles apart. A travels 2 miles an hour faster than B. If they meet after each has been travelling 9 hours, how far has each gone?

Solution.

Let x = miles A travels per hour.
$x - 2$ = miles B travels per hour.
Then $x + x - 2 = 2x - 2$ = distance travelled by A and B in one hour.

By the conditions of the problem, they meet after 9 hours. This gives the relation

$$9\ (2x - 2) = 144$$

Solving,
$18x - 18 = 144.$
$18x = 144 + 18$
$= 162$
$x = 9$ miles per hour, A's rate.
$x - 2 = 7$ miles per hour, B's rate.

To check these results, notice that in 9 hours A will travel 81 miles and B will travel 63 miles. The sum of these distances is 144 miles.

EQUATIONS WITH LITERAL COEFFICIENTS.

It is often possible to express a general relation by means of an equation with literal coefficients and from this to solve for other relations. In the case of formulas, this amounts to considering first one and then another of the quantities as unknown. Equations of this kind are solved in the same manner as other equations.

Problem. Find the value of x in

$$ax - a^2 + 3a = 2x + a$$

Solution.

Transpose all x terms to the left and all other terms to the right.

$ax - 2x = a^2 - 3a + a$
$(a - 2)\ x = a^2 - 2a$
$= a\ (a - 2)$.

Dividing by the coefficient of x.

$$x = \frac{a\ (a - 2)}{(a - 2)}.$$

Hence, $x = a$.

To check the solution of a literal equation, substitute the result for the unknown in the original equation. This gives,

$aa - 2a = a^2 - 3a + a$
or $a^2 - 2a = a^2 - 2a$ which is an identity. Check.

SPECIAL PRODUCTS.

Some products occur very frequently in algebra. The special forms of the more important of these should be learned at once.

The square of the sum of two terms.

$$(a + b)\ (a + b) = a^2 + 2ab + b^2.$$

PROOF.

$a + b$
$a + b$

$a^2 + ab$
$ab + b^2$

$a^2 + 2ab + b^2$

EXAMPLE. $(3x + 2y)^2 = 9x^2 + 12xy + 4y^2$.

The above relation is true for any values of a and b.

The above identity may be expressed as a rule in the following words.

Rule. The square of the sum of two numbers is equal to the square of the first, plus twice the product of the first by the second, plus the square of the second.

In all the work in this section, the letters a, b, c and so on are used to indicate any algebraic number or term.

The square of the difference of two terms.

$$(a - b)\ (a - b) = a^2 - 2ab + b^2.$$

The proof is by multiplication as above.

The identity states that *the square of the difference of two numbers is equal to the square of the first, minus twice the product of the first by the second, plus the square of the second.*

EXAMPLE. $(3x - 2y)^2 = 9x^2 - 12xy + 4y^2$.

The product of the sum and difference of two numbers.

$$(a + b)\ (a - b) = a^2 - b^2.$$

PROOF.

$$\begin{array}{r} a + b \\ a - b \\ \hline a^2 + ab \\ \quad - ab - b^2 \\ \hline a^2 \qquad - b^2 \end{array}$$

Rule. The product of the sum and difference of two numbers is equal to the difference of their squares.

EXAMPLE. $(2x + 3y)\ (2x - 3y) = 4x^2 - 9y^2$.

The product of two binomials having a common term.

$$(x + a)\ (x + b) = x^2 + (a + b)x + ab.$$

PROOF.

$$\begin{array}{r} x + a \\ x + b \\ \hline x^2 + ax \\ \quad + bx + ab \\ \hline x^2 + ax + bx + ab \end{array}$$

or $x^2 + (a + b)x + ab$

Rule. The product of two binomials having a ***common*** *term is equal to the square of the common term, plus the product of the common term by the algebraic sum of the other two terms, plus the product of these terms.*

It should be noticed that in this case, any of the numbers may be positive or negative. The phrase, algebraic sum, covers all cases. In a similar manner, the rules for the square of the sum of two numbers and the square of the difference of two numbers may be combined into one statement by considering the sign of the second term as being such that the expression may be considered as the sum of two numbers.

EXAMPLES.

$$(x + 2)\ (x + 3) = x^2 + 5x + 6$$
$$(2x + 3y)\ (2x - y) = 4x^2 + 4xy - 3y^2$$

The square of any polynomial.

$$(a + b + c)^2 = a^2 + b^2 + c^2 + 2ab + 2ac + 2bc.$$

PROOF. Regard $a + b$ as one number.

$$\begin{aligned}(a + b + c)^2 &= [(a + b) + c]^2 \\ &= (a + b)^2 + 2(a + b)c + c^2 \\ &= a^2 + 2ab + b^2 + 2ac + 2bc + c^2.\end{aligned}$$

Rule. The square of any polynomial is equal to the sum of the squares of each of its terms plus twice the product of each term by every term which follows it in the expression.

In the above, the sign preceding each term is considered as a part of the term.

EXAMPLE. Square $x + y - z$.

$$(x + y - z)^2 = x^2 + y^2 + z^2 + 2xy - 2xz - 2yz.$$

The expression is regarded as being composed of the terms x, y, and $-z$.

The cube of a binomial.

$$(a + b)^3 = a^3 + 3a^2b + 3ab^2 + b^3.$$

PROOF. Multiply the square of $a + b$ by $a + b$.

Rule. The cube of a binomial is equal to the cube of the first term, plus three times the square of the first times the second, plus three times the first times the square of the second, plus the cube of the second.

This rule covers the case of the difference as well as the sum of two numbers.

EXAMPLES. $(2x + y)^3 = 8x^3 + 12x^2y + 6xy^2 + y^3$.
$(2x - y)^3 = 8x^3 - 12x^2y + 6xy^2 - y^3$.

Special methods of division may be derived from these special products. They are considered in the section on factoring, however, so they are not stated here. They furnish a rapid means for finding the quotient of two numbers.

FACTORING.

Def. *Factoring* an algebraic expression is the process of finding two or more expressions which when multiplied together produce the given expression.

Def. A *prime factor* is an algebraic expression which has no factor except itself and unity.

1. Factors of a monomial.

The factors of a monomial are the factors of the numerical coefficient and the various letters each taken as many times as is indicated in the exponent of the letter.

EXAMPLE. The factors of $12ax^2y^3$ are 2, 2, 3, a, x, x, y, y, y.

2. Roots of a monomial.

Def. The *square root* of an expression is one of the two equal factors whose product is the expression. Symbol, $\sqrt{\ }$.

In arithmetic, there is only one such number. That is, the square root of 4 is +2, of 9 is +3, etc.

In algebra, with the introduction of negative numbers, 4 has two square roots, namely +2 and −2; 9 has two square roots, namely +3 and −3; etc.

Every positive number and every algebraic expression that is equivalent to a positive number, has two square roots which differ only in sign.

The presence of the two roots is shown by the sign ($\pm$) written before the root. It is read "plus or minus."

Rule. To find the square root of a letter raised to any power, divide the exponent of the letter by 2, writing the letter to this power preceded by the $\pm$ sign.

EXAMPLE. $\sqrt{x^2} = \pm x$.
$\sqrt{a^4} = \pm a^2$.

Rule. The square root of a monomial is equal to plus or minus the square root of the numerical coefficient times all the letters of the monomial, each with an exponent equal to one-half its exponent in the monomial.

EXAMPLE. $\sqrt{16a^2x^4} = \pm 4ax^2$.
$\sqrt{225x^4y^6} = \pm 15x^2y^3$.

Def. The *cube root* of an expression is one of the three equal factors whose product is the expression.

At present, it is not possible to extract the square root of a negative number. It is possible, however, to find the cube root of any number, either positive or negative. E.g., the cube root of + 27 is + 3, and the cube root of − 27 is − 3.

In general, every number or algebraic expression has a cube root which has the same sign as the expression.

Rule. In extracting the cube root of a letter to a power, the new exponent is found by dividing the old exponent by 3.

EXAMPLE. $\sqrt[3]{a^3} = a$; $\sqrt[3]{a^3x^6} = ax^2$; $\sqrt[3]{-x^6y^{12}} = -x^2y^4$

Rule. The cube root of a monomial is equal to the cube root of the numerical coefficient with its sign, times all the letters of the monomial, each with an exponent equal to one-third its exponent in the monomial.

EXAMPLE. $\sqrt[3]{64x^3y^6} = 4xy^2$.

$\sqrt[3]{-125a^3x^9} = -5a^3x^3$.

The above process may be extended to any root desired. The required root is found by dividing the exponent by the index of the root. Obviously, it is not always possible to divide an exponent, evenly, as in the case of the square root of x^3. Problems of this kind are treated in the theory of exponents.

3. Polynomials with a common monomial factor.

Polynomials of the form

$$ax + ay - az$$

may be factored by dividing the polynomial by a.

$$(ax + ay - az) = a(x + y - z).$$

Rule. Divide the expression by the monomial factor, writing the polynomial equal to the monomial factor times the quotient thus obtained.

EXAMPLES. $ax - a = a(x - 1)$.

$2x^2y - xy + xy^2 = xy(2x - 1 + y)$.

4. Trinomials that are perfect squares.

From the work on special products, the trinomial is of one of the following forms.

$$a^2 + 2ab + b^2 = (a + b)\ (a + b) = (a + b)^2$$
$$a^2 - 2ab + b^2 = (a - b)\ (a - b) = (a - b)^2$$

In both these type forms, two terms are perfect squares.

Both the square terms have the sign +.

The third term is equal to 2 times the product of the square roots of the other two terms.

The two cases are distinguished from each other by the sign of the third term.

There are two steps in factoring such a trinomial. First test to see if its terms satisfy the above conditions. Then apply one of the type forms given above.

If the expression is arranged in descending powers of some letter, the first and third terms will be the square terms.

Rule 1. Test. A trinomial is a perfect square if, after arranging in descending powers of some letter, the absolute value of the middle term is equal to twice the product of the absolute values of the square roots of the other two terms.

2. Factor. The square root of the trinomial is the sum or difference of these square roots, the sum if the middle term is positive, the difference if the middle term is negative.

EXAMPLES. Find the square root of each of the following trinomials when possible.

$x^2 + 4y^2 + 4xy = x^2 + 4xy + 4y^2 = (x + 2y)^2$

$9a^2 - 12ab + 4b^2 = (3a - 2b)^2$

$4x^2 + 6ax + 9a^2 = \ldots\ldots$

This trinomial is not a perfect square since $2 \cdot 2x \cdot 3a = 12ax$ is not equal to $6ax$.

5. Binomials, the difference of two squares.

From the work on special products, the following relation is obtained.

$$a^2 - b^2 = (a + b)\ (a - b).$$

Rule. A binomial which is the difference of the squares of two numbers, is equal to the product of the sum of these numbers by their difference. The number whose square is preceded by the sign − in the original binomial must have a minus sign in one of the factors of the binomial.

EXAMPLES. Factor $4x^2 - 9y^2$.

$4x^2 - 9y^2 = (2x + 3y)\ (2x - 3y)$.

Therefore, the factors are $2x + 3y$ and $2x - 3y$.

Factor. $81a^2x^4 - 49b^2y^4$.

$81a^2x^4 - 49b^2y^4 = (9ax^2 + 7by^2)\ (9ax^2 - 7by^2)$.

Therefore, the factors are $9ax^2 + 7by^2$ and $9ax^2 - 7by^2$.

6. Quadratic trinomials.

Def. A *quadratic trinomial* is of the form

$$x^2 + bx + c.$$

From the work on special products, using h and k instead of a and b, the following relation is obtained.

$$x^2 + (h + k)x + hk = (x + h)\ (x + k).$$

The following rule is obtained from a comparison of these two expressions.

Rule. Find two numbers whose algebraic product is equal to c (the constant term) and whose algebraic sum is equal to b (the coefficient of x).

One factor of the trinomial is x plus one of these numbers, the other factor is x plus the other number.

EXAMPLE. Factor $x^2 - 7x + 12$.

It is necessary to find two factors of + 12, whose algebraic sum is −7. Since 12 is positive, the numbers must have the same sign. This sign is − since, the sum of the numbers is to be −7. Consider the pairs of factors of 12, discarding those whose sum is not −7.

−1 and −12 No.

−2 and −6 No.

−3 and −4 Yes.

Hence, $x^2 - 7x + 12 = (x - 3)\ (x - 4)$ and the factors are $x - 3$ and $x - 4$.

EXAMPLE. Factor $x^2 + 11x - 42$.

Since 42 is negative, the factors must be opposite in sign. The greater factor is positive since the algebraic sum is +11. Consider the factors of 42 that satisfy these conditions, discarding those whose sum is not +11.

+42 and −1. No.

+21 and −2. No.

+14 and −3. Yes.

Hence, $x^2 + 11x - 42 = (x + 14)\ (x - 3)$
and the factors are $x + 14$ and $x - 3$.

The testing for factors of c should always be done mentally, if possible.

If factors of c cannot be found which satisfy the conditions, the trinomial is prime, i.e., it has no binomial factors.

7. Binomials the sum or difference of the same power of two numbers.

The case of the difference of the squares of two numbers has already been considered.

The sum of the squares of two numbers is always prime.

E.g. $a^2 + b^2$; $x^4 + y^4$; etc. may be thought of as the sum of two squares. They cannot be factored using the numbers of elementary algebra.

The sum of two cubes. $a^3 + b^3$.

Divide by $a + b$.

$$\begin{array}{l|l} a^3 + b^3 & a + b \\ \underline{a^3 + a^2b} & \overline{a^2 - ab + b^2} \\ -a^2b + b^3 & \\ \underline{-a^2b - ab^2} & \\ +ab^2 + b^3 & \\ \underline{+ab^2 + b^3} & \\ \end{array}$$

Hence, $a^3 + b^3 = (a + b)\ (a^2 - ab + b^2)$.
Similarly, $a^3 - b^3 = (a - b)\ (a^2 + ab + b^2)$.

Rules covering this and other cases are more complicated than the formulas themselves. The student should be familiar with these relations and their uses.

EXAMPLE. Factor $x^6 - 64$.

From the formula, the first term is $(x^2)^3$, the second is 4^3.

$$x^6 - 64 = (x^2 - 4)(x^4 + x^2 \cdot 4 + 4^2)$$
$$= (x^2 - 4)(x^4 + 4x^2 + 16).$$

Hence, the factors are $x^2 - 4$ and $x^4 + 4x^2 + 16$.

EXAMPLE. Factor $27x^3 + 1$.

$$27x^3 + 1 = (3x + 1)(9x^2 - 3x + 1).$$

Hence, the factors are $3x + 1$ and $9x^2 - 3x + 1$.

Similar rules may easily be found for factoring the sum and difference of odd powers, as 5, 7, and so on.

The difference of two numbers to the fourth power, may be factored by the rule for the difference of two squares. One of the resulting factors can sometimes be factored by the same rule.

EXAMPLE. Factor $x^4 - 16$.

$$x^4 - 16 = (x^2 + 4)(x^2 - 4)$$
$$= (x^2 + 4)(x + 2)(x - 2).$$

Oftentimes it is necessary to use more than one method in finding the prime factors of an expression.

EXAMPLE. Factor $x^6 - x^3 - 2$.

Use the rule for a quadratic trinomial.

$$x^6 - x^3 - 2 = (x^3 - 2)(x^3 + 1)$$

The first factor is prime. The second may be factored by the rule for the sum of two cubes.

$$x^6 - x^3 - 2 = (x^3 - 2)(x + 1)(x^2 - x + 1).$$

EQUATIONS SOLVED BY FACTORING.

Def. *A* polynomial is said to be an *integral polynomial*, if its numerical coefficients are integers.

E.g. $3x^2 + 3x - 5$ is an integral polynomial in x.

Def. The *degree* of a polynomial is the same as the highest power of the unknown in it.

When a polynomial is set equal to zero, an equation is formed the degree of which is the same as the degree of the polynomial.

Equations of the first degree are called *linear*, if of the second degree they are called *quadratics*, if of the third degree they are called *cubics*, if of the fourth degree they are called *biquadratics*, etc.

Equations of the second and higher degrees may often be solved by using the following principle.

PRINCIPLE. *If the product of two or more factors is equal to zero, one of the factors must be equal to zero.*

In solving an equation which can be factored, each of the factors must be set equal to zero and the resulting equations solved to find all the possible values of the unknown.

Problem. Solve the quadratic equation,
$$x^2 + 5x - 24 = 0.$$

Solution. Factoring the left of this equation,
$$(x + 8)\ (x - 3) = 0$$
Set the first factor equal to zero,
$$x + 8 = 0.$$
$$x = -8, \text{ One root.}$$
Set the second factor equal to zero,
$$x - 3 = 0.$$
$$x = 3, \text{ Other root.}$$

To check, substitute each value in the given equation.
-8 gives $64 + (-40) - 24 = 64 - 40 - 24 = 0$, check.
$+3$ gives $9 + 15 - 24 = 24 - 24 = 0$, check.

Problem. Find two consecutive odd numbers, the sum of whose squares is 290.

Solution. Let x = any number
Then $2x + 1$ = an odd number
and $2x + 3$ = the next consecutive odd number.

By the conditions of the problem,
$$(2x + 1)^2 + (2x + 3)^2 = 290$$
Squaring and collecting terms,
$$8x^2 + 16x + 10 = 290.$$
or $$8x^2 + 16x - 280 = 0.$$
Dividing by 8, gives
$$x^2 + 2x - 35 = 0$$
Factoring,
$$(x - 5)\ (x + 7) = 0$$
Setting each factor equal to zero,
$x - 5 = 0$ which gives $x = 5$.
or $x + 7 = 0$ which gives $x = -7$.

Using $x = 5$, the two odd numbers, $2x + 1$ and $2x + 3$ are 11 and 13 respectively.

Using $x = -7$, they are -13 and -11 respectively.

To check, add the squares of these numbers.

HIGHEST COMMON FACTOR.

Def. The *degree of a term* is equal to the sum of the exponents of the letters which compose it.

E.g. ax is a term of the second degree, x^2y^2 is a term of the fourth degree, etc.

Corresponding to the greatest common factor of two or more numbers in arithmetic, is the highest common factor in algebra.

Def. The *highest common factor* of two or more algebraic expressions is the factor of highest degree with the greatest numerical coefficient which is common to the expressions. Abbreviation is H. C. F.

To find the highest common factor of expressions which can be readily factored.

Rule. Separate each expression into its prime factors. Find the product of all factors which are common to all the expressions, taking each the least number of times it occurs in any of the expressions.

EXAMPLE. Find the H. C. F. of $a^3 + 2a^2 + a$; $a^3 - a$; and $a^3 + 5a^2 + 4a$.

$a^3 + 2a^2 + a = a(a+1)(a+1)$.
$a^3 - a = a(a+1)(a-1)$.
$a^3 + 5a^2 + 4a = a(a+1)(a+4)$.

Therefore, the H. C. F. $= a(a+1)$ or $a^2 + a$.

If two expressions have a common factor, this is also a factor of the difference between the expressions: This fact may be generalized as follows:

Rule. If two expressions have a common factor, the remainder obtained by dividing one by the other will have as a factor the H. C. F. of the original expressions.

This furnishes a convenient method for testing two expressions for a common factor when the expressions are not readily factorable. The process is illustrated in the following example.

EXAMPLE. Find the H. C. F. of $x^3 - 8x^2 + 19x - 12$ and $x^4 - 7x^3 + 10x^2 - 9x + 5$.

Solution.

$$x^3 - 8x^2 + 19x - 12 \;|\; x^4 - 7x^3 + 10x^2 - 9x + 5 \;|\; x + 1$$
$$x^4 - 8x^3 + 19x^2 - 12x$$
$$x^3 - 9x^2 + 3x + 5$$
$$x^3 - 8x^2 + 19x - 12$$
$$-\ x^2 - 16x + 17$$

It is permissible at any time to multiply or divide by any numerical coefficient. The common factor of the original expressions is a factor of this remainder. Change the sign of the terms in the remainder, i.e., multiply by -1, and divide the former quotient by this remainder. The above principle still holds.

$$x^2 + 16x - 17 \;|\; x^3 - 8x^2 + 19x - 12 \;|\; x$$
$$x^3 + 16x^2 - 17x$$

Divide by -12:
$$-24x^2 + 36x - 12$$
$$2x^2 - 3x + 1 \;|\; +2$$
$$2x^2 + 32x - 34$$

Divide by -35:
$$-35x + 35$$
$$x - 1$$

The common factor of the original expressions is also a factor of this last remainder. Divide the preceding quotient by this last remainder.

$$x - 1 \;|\; x^2 + 16x - 17 \;|\; x + 17$$
$$x^2 - x$$
$$+\ 17x - 17$$
$$17x - 17$$

When a remainder is found which exactly divides the preceding divisor, it is the H. C. F. required.

Hence, the H. C. F. of the above numbers is $(x - 1)$.

If the process is continued until the final remainder is a numerical quantity, there is no common factor and the numbers are prime to each other.

LOWEST COMMON MULTIPLE.

Def. The *lowest common multiple* (L. C. M.) of two or more algebraic expressions is the expression of lowest degree and smallest numerical coefficient which exactly contains each.

To find the lowest common multiple. First method.

Rule. Separate each expression into its prime factors. The least common multiple is the product of all the different prime factors, each taken as many times as it occurs in any of the original expressions.

EXAMPLE. Find the L. C. M. of
$(x^2 - 1)$, $(x^2 + 2x + 1)$, $(x^2 + 8x + 7)$.

Factoring,

$$x^2 - 1 = (x+1)(x-1).$$
$$x^2 + 2x + 1 = (x+1)^2.$$
$$x^2 + 8x + 7 = (x+1)(x+7).$$

In order that an expression may be a multiple of $x^2 - 1$, it must contain $x + 1$ and $x - 1$.

In order that it may contain $x^2 + 2x + 1$, it must contain the factor $x + 1$ repeated.

In order that it may contain $x^2 + 8x + 7$, it must contain the factors $x + 1$ and $x + 7$.

However, if an expression contains $x + 1$ repeated, it needs only to contain $x - 1$ to be multiple of $x^2 - 1$ and $x + 7$ to be a multiple of $x^2 + 8x + 7$.

Hence,
L. C. M. $= (x+1)^2(x-1)(x+7)$.

Second method.

Rule. Divide each expression by the H. C. F. of the given expression. The L. C. M. is the product of the H. C. F. and the quotients so found.

EXAMPLE. Find the L. C. M. of
$x^2 - 5x + 6$, $x^2 - 7x + 12$.

The H. C. F. $= x - 3$.
$(x^2 - 5x + 6) \div (x - 3) = x - 2$.
$(x^2 - 7x + 12) \div (x - 3) = x - 4$.
$\therefore$ L. C. M. $= (x-3)(x-2)(x-4)$.

FRACTIONS.

In arithmetic, a fraction is first regarded as indicating how many equal parts of a unit are to be considered. Later, a fraction is seen to be an indicated division. By their use, division of any number by any other number is possible. The same holds true for the numbers of algebra.

Def. An *algebraic fraction*, or more briefly, a *fraction*, is an indicated division between two algebraic expressions. The fraction is written $\frac{a}{b}$. The expression above the line is called the *numerator* of the fraction. It is the dividend in the indicated division. The expression below the line is called the *denominator*. It is the divisor in the indicated division. The *value* of the fraction is the quotient.

The letters, a and b, may represent any number, positive or negative, or any algebraic expression with only one exception. This exception which was noted in the section on division, follows:

The denominator, b, of a fraction can never be zero. (Division by zero is not permitted).

Def. The *terms* of a fraction are the numerator and the denominator.

The same operations can be performed on the terms of a fraction in algebra as in arithmetic.

1. The terms may both be multiplied by the same number without changing the value of the fraction.

2. The terms may both be divided by the same number without changing the value of the fraction.

3. Multiplying the numerator by any number multiplies the value of the fraction by the same number.

4. Dividing the numerator by any number divides the value of the fraction by the same number.

5. Dividing the numerator is the same as multiplying the denominator, and multiplying the numerator is the same as dividing the denominator.

The laws for signs in division may be extended to fractions by recalling the relation between the terms of a fraction and the terms of a division.

There are three signs in connection with a fraction; the *sign of the fraction* which is written before the dividing line, the *sign of the numerator*, and the *sign of the denominator*.

Since two minus signs in multiplication and division combine to make a plus, it follows that any two of the signs of a fraction may be changed without changing the value of the fraction.

E.g. The same fraction may be written in any of the following forms:

$$\frac{a}{b} = \frac{-a}{-b} = \frac{-a}{b} = -\frac{a}{-b}.$$

Def. A *proper fraction* in algebra is a fraction in which the degree of the numerator is less than the degree of the denominator.

EXAMPLE. $\dfrac{x}{x^2+1}$.

Def. An *improper fraction* in algebra is a fraction in which the degree of the numerator is equal to or greater than the degree of the denominator.

EXAMPLE. $\dfrac{x^2-2x+3}{x+1}$.

Def. A *mixed number* is an algebraic expression which contains both integral and fractional parts.

EXAMPLE. $x-1+\dfrac{x+1}{x}$.

REDUCTION OF FRACTIONS.

Def. To *reduce a fraction* is to change its form without changing its value.

Def. A fraction is *reduced to its lowest terms*, when its terms have no common factor.

To reduce a fraction to its lowest terms.

Write the numerator and denominator in factored form. Cancel the factors common to both.

EXAMPLES.
$$\frac{3ax^2y}{12axy^2} = \frac{\cancel{3}\cancel{a}\cancel{x}\cancel{x}\cancel{y}}{\cancel{3}\cdot 4\cancel{a}\cancel{x}\cancel{y}\cancel{y}} = \frac{x}{4y}.$$

$$\frac{x^2-4}{x^2-5x+6} = \frac{(x+2)(x-2)}{(x-3)(x-2)} = \frac{x+2}{x-3}$$

In cancelling, one must be sure that the terms cancelled are factors of the entire numerator or of the entire denominator. Students often make the mistake of cancelling numbers which are alike even when they are part of polynomial expressions connected with the rest of the term of the fraction by plus or minus signs. The following method of cancelling is incorrect.

$$\frac{x^2-4}{x^2-5x+6} = \frac{\cancel{x^2}-4}{\cancel{x^2}-5x+6} = \frac{-4}{-5x+6}.$$ Wrong.

The terms must first be factored.

$$\frac{x^2-4}{x^2-5x+6} = \frac{(x+2)\cancel{(x-2)}}{\cancel{(x-2)}(x-3)} = \frac{x+2}{x-3}.$$ Correct.

To reduce an improper fraction to a mixed number.

Divide the numerator by the denominator. Write the quotient as the integral part and the remainder over the denominator as the fractional part of the mixed number.

EXAMPLE. $\dfrac{x^3+3x^2-2x+1}{x^2+1} = x+3-\dfrac{3x+2}{x^2+1}$

Divisor, x^2+1) x^3+3x^2-2x+1 ($x+3$ Quotient

$x^3 \quad +x$

$+3x^2-3x+1$

$3x^2 \quad +3$

$-3x-2 = -(3x+2)$ Remainder.

To reduce a mixed number to an improper fraction.

Multiply the integral part of the number by the denominator of the fractional part. Add this product to the numerator of the fractional part and write the result over the original denominator.

EXAMPLE. $x^2-4x+1-\dfrac{4}{2x} = \dfrac{2x^3-8x^2+2x-4}{2x}$

To reduce two or more fractions to their lowest common denominator.

Find the L. C. M. of the denominators. This is the least common denominator. (L. C. D.)

Divide the L. C. D. by each denominator.

Multiply the corresponding numerator by the quotient thus obtained and write the products over the L. C. D.

Notice that this involves multiplying the terms of the fraction by the same number or expression. By (1) above, this does not change the value of the fraction.

EXAMPLE. Reduce $\dfrac{1}{x^2-3x-4}$ and $\dfrac{1}{x^2+3x+2}$ to a common denominator.

$$\frac{1}{x^2-3x-4} = \frac{1}{(x-4)(x+1)} = \frac{x+2}{(x-4)(x+1)(x+2)},$$

and

$$\frac{1}{x^2+3x+2} = \frac{1}{(x+2)(x+1)} = \frac{x-4}{(x-4)(x+1)(x+2)}.$$

Since the L. C. D. $= (x-4)(x+1)(x+2)$.

ADDITION AND SUBTRACTION OF FRACTIONS.

Only like numbers can be added to or subtracted from each other. With this in mind, the following rule may be stated.

Rule. To add or subtract two or more fractions, reduce the fractions to a common denominator, preferably the L. C. D.

To add, find the algebraic sum of the new numerators.

To subtract, change the sign of each term in the numerator of the fraction to be subtracted and add.

Place the resulting expression over the common denominator and reduce the resulting fraction to its lowest terms.

EXAMPLE. Simplify,

$$\frac{x^2}{x^2-1} + \frac{x}{x+1} - \frac{x}{x-1}.$$

The L. C. D. $= x^2-1 = (x+1)(x-1)$

$$\frac{x^2}{x^2-1} = \frac{x^2}{(x+1)(x-1)}$$

$$\frac{x}{x+1} = \frac{x(x-1)}{(x+1)(x-1)} = \frac{x^2-x}{(x+1)(x-1)}$$

$$-\frac{x}{x-1} = -\frac{x(x+1)}{(x+1)(x-1)} = \frac{-x^2-x}{(x+1)(x-1)}$$

The sum of the numerators is $x^2 + x^2 - x - x^2 - x = x^2 - 2x$.

Hence, $\frac{x^2}{x^2-1} + \frac{x}{x+1} - \frac{x}{x-1} = \frac{x^2-2x}{(x+1)(x-1)} = \frac{x(x-2)}{x^2-1}$

Notice that the sign of subtraction in the last fraction is changed along with the sign of the numerator. The algebraic sum of the numerators is then found and placed over the L. C. D

MULTIPLICATION.

With proper regard for the signs of the various terms, fractions in algebra are multiplied in the same manner as in arithmetic.

Rule. To multiply two or more algebraic fractions, find the product of the numerators and write it as the required numerator over the product of the denominators which is the required denominator.

The above process is greatly simplified by the following operations.

Factor each numerator and each denominator.

Write the indicated product of all the numerators over the indicated product of all the denominators.

Cancel all factors which are common to numerators and denominators.

Multiply the remaining factors in the numerator and denominator to get the terms of the required product.

The sign of the product is governed by the laws of signs as stated in the section on multiplication above.

EXAMPLE. Find the product of the following $\frac{x+1}{x^4-1}$ and $\frac{x^2-1}{(x+1)^2}$.

$$\frac{x+1}{x^4-1} \times \frac{x^2-1}{(x+1)^2} = \frac{\cancel{(x+1)}}{\cancel{(x+1)}\cancel{(x-1)}(x^2+1)\cancel{(x+1)}} \cdot \frac{\cancel{(x+1)}\cancel{(x-1)}}{\cancel{(x+1)}(x+1)}$$

$$= \frac{1}{(x^2+1)(x+1)} = \frac{1}{x^3+x^2+x+1}$$

DIVISION.

Division is the reverse of multiplication.

Rule. To divide by a fraction, invert the divisor and multiply.

This is the same rule as is used in arithmetic.

The work of division by fractions is simplified by following the same steps in the solution of the problem as in multiplication.

EXAMPLE. Divide $\frac{x^2-6x-16}{x^2+4x-21}$ by $\frac{x^2+9x+14}{x^2-8x+15}$

$$\frac{x^2-6x-16}{x^2+4x-21} + \frac{x^2+9x+14}{x^2-8x+15} = \frac{x^2-6x-16}{x^2+4x-21} \cdot \frac{x^2-8x+15}{x^2+9x+14}$$

$$= \frac{(x-8)\cancel{(x+2)}\cancel{(x-3)}(x-5)}{(x+7)\cancel{(x-3)}\cancel{(x+2)}(x+7)}$$

$$= \frac{(x-8)(x-5)}{(x+7)(x+7)} = \frac{x^2-13x+40}{x^2+14x+49}$$

Def. A *complex fraction* is a fraction containing fractional expressions either in the numerator or in the denominator or in both.

To simplify a complex fraction.

Reduce both the numerator and denominator to fractional form. Then multiply the numerator by the inverse of the denominator.

EXAMPLE. Simplify $\frac{a+1-\frac{1}{a}}{a+\frac{3}{a}-\frac{1}{a^2}}$.

Reduce numerator and denominator to fractional form.

$$\frac{a+1-\frac{1}{a}}{a+\frac{3}{a}-\frac{1}{a^2}} = \frac{\frac{a^2+a-1}{a}}{\frac{a^3+3a-1}{a^2}}$$

$$= \frac{a^2+a-1}{\cancel{a}} \times \frac{\cancel{a^2}^{a}}{a^3+3a-1}$$

$$= \frac{a(a^2+a-1)}{a^3+3a-1}$$

FRACTIONAL EQUATIONS.

Many problems lead in their solutions to equations involving fractions.

In order to solve equations of this kind, notice is taken of the fact that if a fraction is equal to zero, its numerator must be zero. Hence, if the entire expression can be reduced to a single fraction equal to zero, the equation can be replaced by the numerator set equal to zero.

In practice, it is customary to reduce each member of the equation to the same denominator, and then drop this denominator. This process may be accomplished in one operation by the following rule.

Rule. Remove all parenthesis.

Multiply both members of the equation by the L. C. D. of the fractions involved, and solve the resulting equation.

In simplifying the resulting expressions, remember that a minus sign before a fraction changes all the signs in the numerator when it is to be combined with other numerators. If the work is correctly performed, the members of the equation will be clear of fractions.

EXAMPLE. Solve $\frac{1}{x} + \frac{2}{x-1} = \frac{8}{x(x-1)}$.

Solution. L. C. D. $= x(x-1)$.

Multiplying both members by $x(x-1)$.

$$\frac{\cancel{x}(x-1)}{\cancel{x}} \cdot \frac{1}{} + \frac{x\cancel{(x-1)}}{\cancel{(x-1)}} \cdot \frac{2}{} = \frac{\cancel{x}\cancel{(x-1)}}{\cancel{x}\cancel{(x-1)}} \cdot \frac{8}{}$$

$$x - 1 + 2x = 8$$
$$3x = 9$$
$$x = 3$$

To check, substitute above

$$\frac{1}{3} + \frac{2}{3-1} = \frac{8}{3(3-1)}$$

$$\frac{1}{3} + 1 = \frac{8}{3 \cdot 2}$$

$$\frac{4}{3} = \frac{4}{3}$$ Check.

Problem. A, B, C can do a piece of work in 6 days. A can do it alone in 15 days, B can do it alone in 18 days. How long will it take C to do the work?

Solution. Let x = Number of days it will take C to do the work.

Then $\frac{1}{15}$ = Amount A does in one day.

$\frac{1}{18}$ = Amount B does in one day.

$\frac{1}{x}$ = Amount C does in one day.

$\frac{1}{6}$ = Amount they do working together in one day.

Hence,

$$\frac{1}{15} + \frac{1}{18} + \frac{1}{x} = \frac{1}{6}$$

Multiplying by the L.C.D. $= 90x$ gives

$$6x + 5x + 90 = 15x$$

Transposing,

$$11x - 15x = -90$$

$$x = \frac{90}{4} = 22\frac{1}{2} \text{ days.}$$

To check, substitute in the equation.

Problem. Two men start at the same time to travel from A to a town B 80 miles distant. One man travels 4 miles an hour faster than the other and arrives at the town first. He immediately starts back and meets the other man 64 miles from A. How fast did each man travel?

Solution. Let x = rate per hr. of slower man.

Then $x + 4$ = rate per hr. of faster man.

$\frac{64}{x}$ = time first man was traveling.

$\frac{96}{x+4}$ = time second man was traveling.

By the conditions of the problem these times are equal.

$$\frac{96}{x+4} = \frac{64}{x}$$

Multiplying by the L.C.D. $= x(x+4)$,

$$96x = 64(x+4) = 64x + 256.$$

or $$32x = 256.$$

$$x = 8 \text{ rate of one man.}$$

$$x + 4 = 12 \text{ rate of other.}$$

To check, notice that one will have gone $8 \times 8 = 64$ miles while the other will have gone $8 \times 12 = 96$ miles.

SIMULTANEOUS SIMPLE EQUATIONS.

An equation in two or more unknowns is satisfied by an indefinitely great number of pairs or sets of values for the unknowns.

E.g. $2x - y = 4$ is satisfied by the following pairs of values; the x value being written first and the y value second: (2, 0), (3, 2), (6, 8), (1, −2), etc.

Def. An equation is said to be of the *first degree in two variables* if neither is multiplied by itself or by the other. If the variables are x and y, powers of either of these letters are excluded and so are terms containing the product xy.

Def. A set of equations is said to be *simultaneous* if each is satisfied by the same sets of values of the unknowns. If there are two unknowns, there must be two equations. If there are three unknowns, there must be three equations, etc.

Not all sets of equations are simultaneous. Some may not be satisfied by the same set of values. These are called *contradictory* equations. Others are so related that any set of values which satisfies one equation will also satisfy the other. These are called *dependent equations.* Equations of this kind can be derived from each other by addition and subtraction.

Def. Two equations are said to be *independent,* if neither can be derived from the other.

EXAMPLES.

The equations $2x - y = 4$, $x + y = 6$ are independent.

The equations $2x - 3y = 1$, $6x - 9y = 3$ are dependent.

The equations $x + 2y = 6$, $x + 2y = 10$ are contradictory.

To solve simultaneous independent equations.

Def. *Elimination* is the process of combining the equations in such a way that one of the unknowns is cancelled.

Rule. To solve simultaneous equations, eliminate all but one of the unknowns. Solve the resulting equation for this unknown and substitute in the preceding equations to find the values of the other unknowns.

1. Elimination by addition or subtraction.

In this process, an examination of the equations will indicate which variable can be eliminated most easily. Multiply each equation by some number which will make the coefficient of this letter the same in each equation.

If these coefficients have like signs, subtract the equations; if they have unlike signs, add.

Solve for the remaining unknown. Substitute this value in either of the preceding equations and solve for the other variable.

To check, substitute the pair of values so found in both the original equations.

EXAMPLE. Solve and check the following pair of equations,

$$\begin{cases} x - y = 6 & (1) \\ 5x - 2y = 21 & (2) \end{cases}$$

Using the smaller coefficient, multiply the first equation (1) by 2. (NOTE.—This means, of course, multiplying both members of the equation by (2.) Subtract the result from the second equation, (2).

$$\begin{array}{rll} 5x - 2y = 21 & & (2) \\ 2x - 2y = 12 & & (3) \\ \hline 3x & = 9 & \\ \text{or} \qquad x & = 3 & \end{array}$$

Substituting in (1) above, gives,

$$\begin{array}{rl} 3 - y = & 6 \\ -y = & 3 \\ \text{or} \qquad y = & -3 \end{array}$$

Hence, the solution is $x = 3$, $y = -3$.

To check, substitute in the original equations.

and $$3 - (-3) = 3 + 3 = 6$$

$$5 \cdot 3 - 2(-3) = 15 + 6 = 21 \text{ check.}$$

2. Elimination by substitution.

In this process, solve one of the equations for one of the unknowns in terms of the other unknown.

Substitute the expression so found for this unknown in the other equation and solve the resulting equation.

Complete the solution as in Case 1.

EXAMPLE. Solve and check the following pair of equations.

$$\begin{cases} 2x + y = 3 & (1) \\ 3x - 4y = 10 & (2) \end{cases}$$

Solve (1) for y.

$$y = 3 - 2x \qquad (3)$$

Substitute (3) in (2), and solve.

$$3x - 4(3 - 2x) = 10$$

$$3x - 12 + 8x = 10$$

$$11x = 22$$

or $$x = 2$$

Substituting in (1) gives,

$$y = -1$$

To check, substitute in the original equations,

$$2 \cdot 2 + (-1) = 4 - 1 = 3$$
$$3 \cdot 2 - 4(-1) = 6 + 4 = 10 \quad \text{Check.}$$

3. Elimination by comparison.

In this process, each equation is solved for the same unknown in terms of the other unknown.

The expressions so found are set equal to each other and the resulting equation solved.

Complete the solution as in the other two cases.

EXAMPLE. Solve and check the following pair of equation

$$2x + 3y = 5 \quad (1)$$
$$5x + 2y = 7 \quad (2)$$

From (1)

$$3y = 5 - 2x$$
$$y = \frac{5 - 2x}{3} \quad (3)$$

From (2)

$$2y = 7 - 5x$$
$$y = \frac{7 - 5x}{2} \quad (4)$$

Equating these values of y

$$\frac{5 - 2x}{3} = \frac{7 - 5x}{2} \quad (5)$$

Clear fractions and solve

$$10 - 4x = 21 - 15x$$
$$11x = 11$$
$$x = 1$$

Substituting in (3) $\quad y = \frac{7 - 5}{2} = 1$

To Check, substitute in the original equations.

$$2 + 3 = 5$$
$$5 + 2 = 7 \quad \text{Check.}$$

Simultaneous equations in more than two unknowns are solved by an extension of the above methods.

The graph. A linear equation in two unknowns may be represented by a straight line. Simultaneous independent equations are shown by two intersecting straight lines. The point of intersection represents the solution of the equations.

Many problems occur where it is necessary to form the equations from the conditions which are given. To check problems, the values found must be tried in the problem rather than in the equations as the equations may be incorrect.

Problem. The sum of the length and width of a room is 32 feet. If 2 feet is added to the length and 6 feet is added to the width, the area of the room is increased by 148 sq. ft. What are the dimensions of the room?

Solution. Let x = length of room.
y = width of room.

Then, xy = area of room,
$x + 2$ = length increased by 2,
$y + 6$ = width incresed by 6,

and $(x + 2)(y + 6)$ = new area.

By the conditions of the problem,

$$x + y = 32 \quad (1)$$

and $\quad (x + 2)(y + 6) = xy + 148$

or $\quad xy + 6x + 2y + 12 = xy + 148$

The xy term cancels and this equation becomes,

$$6x + 2y = 136$$

or

$$3x + y = 68, \quad (2)$$
$$x + y = 32. \quad (1)$$

Eliminate by subtracting, (1) from (2).

$$2x = 36$$
$$x = 18 \text{ length of room,}$$

and

$$y = 14 \text{ width of room,}$$

To check, notice that $18 + 14 = 32$, $18 + 2 = 20$ while $14 + 6 = 20$. Also, $20 \times 20 = 400$ which is 148 greater than $18 \times 14 = 252$. Check.

QUADRATIC EQUATIONS.

A quadratic equation has been defined as one made up of a polynomial of the second degree set equal to zero.

$$ax^2 + bx + c = 0.$$

Def. A *pure quadratic equation* is a quadratic equation which does not contain a term of the first degree in the unknown. Such equations are of the form $ax^2 + c = 0$.

To solve a pure quadratic.

Solve the equation for the square of the unknown.

The value of the unknown is the square root of the right hand member with the ± sign.

EXAMPLE. Solve $5x^2 - 3 = 1 - 4x^2$.

Given $\quad 5x^2 - 3 = 1 - 4x^2$

Transpose $\quad 5x^2 + 4x^2 = 1 + 3$

Combine $\quad 9x^2 = 4$

Divide by 9 $\quad x^2 = \frac{4}{9}$

Extract the square root.

$$x = \pm\sqrt{\frac{4}{9}} = \pm\frac{2}{3}$$

Check by substituting in original equation.

$$5\left(\pm\frac{2}{3}\right)^2 - 3 = 1 - 4\left(\pm\frac{2}{3}\right)^2$$
$$\frac{20}{9} - 3 = 1 - \frac{16}{9}$$
$$-\frac{7}{9} = -\frac{7}{9} \quad \text{Check.}$$

Def. A quadratic equation that is not a pure quadratic is called *an affected quadratic equation.* It contains terms of the first and second degree in the unknown. The constant may or may not be zero.

There are 4 methods in common use in solving quadratic equations. The method by factoring, has already been noticed in connection with the section on factoring. The others are illustrated below.

1. By completing the square.

In this process the constant term is transposed to the right and such a number is added to both members of the equation *that the left member is the square of a binomial.*

The square root of both sides of the equation is then taken placing the ± sign in front of the right hand member only.

This gives two equations, one for the + sign and one for the − sign. Each of these is solved giving, in general, two values for the unknown.

EXAMPLE. Solve for x in $x^2 - 8x + 14 = 0$

Given $x^2 - 8x + 14 = 0$

Transposing $x^2 - 8x = -14$

Completing the square

$$x^2 - 8x + 16 = -14 + 16 = 2$$

Extracting the square root of both sides

$$x - 4 = \pm\sqrt{2} = \pm 1.414 \text{ approx.}$$

Using + sign $\quad x - 4 = +1.414$
$x = 5.414$ root

Using − sign $\quad x - 4 = -1.414$
$x = 4 - 1.414 = 2.586$ root

In problems of this nature where the roots are obtained approximately, the checked solution is only approximately equal to 0.

2. The "Hindu" or "4a" method.

This method is a modification of the preceding and is used when the former would involve the use of fractions in completing the square.

In this process, the equation is *multiplied by 4 times the coefficient of the square term.* The square on the left is then completed by adding the square of the original coefficient of the unknown to both sides of the equation. The remainder of the solution is the same as that explained above.

EXAMPLE. Solve for x in $3x^2 - 7x + 4 = 0$.

Given $3x^2 - 7x + 4 = 0$

Transpose $3x^2 - 7x = -4$

Multiply by $4.3 = 12$

$36x^2 - 84x = -48$

Complete the square by adding $7^2 = 49$ to both members.

$36x^2 - 84x + 49 = -48 + 49 = 1$

Extract the square root of both members.

$6x - 7 = \pm 1$

+ sign gives $6x - 7 = 1$

$6x = 8$

$x = \frac{8}{6}$ or $\frac{4}{3}$

− sign gives $6x - 7 = -1$

$6x = 6$

$x = 1$

To Check

$3\left(\frac{4}{3}\right)^2 - 7\left(\frac{4}{3}\right) + 4 = \frac{16}{3} - \frac{28}{3} + 4 = 0$ Check.

and $3 - 7 + 4 = 0$ Check.

3. By the formula.

Any quadratic equation can be expressed in the form $ax^2 + bx + c = 0$. Using the 4a method on this equation with literal coefficients, the following general result is obtained.

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

This expression may be used as a formula and the values of x found by substituting the values of the coefficients as they occur in the equation.

Solution. Solve for x in $5x - 1 = 4x^2$.

Writing the equation in standard form.

$4x^2 - 5x + 1 = 0$

Here $a = 4$, $b = -5$, $c = 1$.

Substituting in the formula.

$$x = \frac{-(-5) \pm \sqrt{(-5)^2 - 4.4.1}}{2.4}$$

$$= \frac{5 \pm \sqrt{25 - 16}}{8}$$

$$= \frac{5 \pm \sqrt{9}}{8} = \frac{5 \pm 3}{8}$$

$= \frac{8}{8} = 1$, using + sign

or $= \frac{2}{8} = \frac{1}{4}$, using − sign

To Check

$4.1^2 - 5.1 + 1 = 4 - 5 + 1 = 0$

and $4\left(\frac{1}{4}\right)^2 - 5\left(\frac{1}{4}\right) + 1 = \frac{1}{4} - \frac{5}{4} + 1 = 0$ Check

Problem. The area of a triangle is 40 square feet. The base of the triangle is seven times the altitude plus 2 feet. Find the lengths of the sides of the triangle.

SOLUTION. Let x = Altitude of triangle.

$7x + 2$ = Base of triangle

By the conditions of the problem

$\frac{1}{2}x(7x + 2) = 40$

or $7x^2 + 2x = 80$

or $7x^2 + 2x - 80 = 0$

Substituting in the formula

$$x = \frac{-2 \pm \sqrt{2^2 - 4.7(-80)}}{2.7}$$

$$= \frac{-2 \pm \sqrt{4 + 2240}}{14}$$

$$= \frac{-2 \pm \sqrt{2244}}{14}$$

$$= \frac{-2 \pm 47.3 +}{14}$$

$$= \frac{45.3}{14} = 3.23 \text{ Approx.}$$

The − sign gives x neg which has no meaning in the problem.

Hence $x = 3.23$ Approx. altitude

$7x + 2 = 24.61$ Approx. base

To Check, $1/2 \times 3.23 \times 24.61 = 39.79+$ which is approximately 40.

If the solution of a quadratic leads to the extraction of the square root of a negative number, the equation has no real roots.

SQUARE ROOT.

The square and square root of monomials have already been considered.

The rule for squaring a binomial, i.e.,

$$(a + b)^2 = a^2 + 2ab + b^2.$$

furnishes the basis for a general solution of the problem; *To find the square root of a polynomial.*

In order to understand the steps in the process, it is necessary to notice that any polynomial may be considered as a binomial expression in which the first term of the polynomial is regarded as the first term, and the algebraic sum of the rest of the polynomial as the second.

The first term of the root is obviously the square root of the first term, i.e., a.

The second term of the square root is seen to be the second term divided by 2 times the first term; i.e., b.

This process may be extended by considering the first two terms of the polynomial as the first term of the above binomial form and the balance of the polynomial as the second term.

E. g. Find the square root of $24a^2 - 8a^3 + 16 - 32a + a^4$.

Arrange in descending powers of a.

$a^4 - 8a^3 + 24a^2 - 32a + 16 \mid a^2 - 4a + 4$

a^4

$2.a^2 = 2a^2 \mid -8a^3 + 24a^2$

$-4a$

$2a^2 - 4a \mid -8a^3 + 16a^2$

$2(a^2 - 4a) = 2a^2 \mid -8a + 16$

$+4$

$2a^2 - 8a + 4 \mid 8a^2 - 32a + 16$

Hence, the square root $= \pm (a^2 - 4a + 4)$.

The steps in the process are explained in the following rule.

Rule. To extract the square root of a polynomial, proceed as follows.

Arrange the polynomial according to ascending or descending powers of some letter in it.

Extract the square root of the first term, writing the expression so found with the plus sign as the first term of the root, and subtract its square from the polynomial.

Use twice the root already found as a trial divisor, and the first term of the remainder as a dividend, writing the quotient as the second term of the root, at the same time annexing it to the trial divisor to form the complete divisor.

Multiply the complete divisor by the term of the root just found and subtract the product from the remainder of the polynomial.

If there is still a remainder, use twice the root already found as a trial divisor and repeat the process. This may be continued till there is no remainder, in which case the polynomial is a perfect square; or it may be continued by the use of negative exponents until the required number of terms have been found.

The double sign, ±, is then placed before the root so found.

In arithmetic, this same process is used. The number 4356 is treated as

$$(4\cdot10^3 + 3\cdot10^2 + 5\cdot10 + 6)$$

and the above method applied. Problems of this nature are solved in the section on arithmetic.

SQUARE ROOT IN ARITHMETIC.

The number 66, is treated as 6.10 + 6. The square of this number is found by the rule for the square of a binomial.

$$(6\,.\,10 + 6)^2 = (6\,.\,10)^2 + 2\,.\,6\,.\,10\,.\,6 + 6^2$$
$$= 3600 + 720 + 36 = 4356.$$

The $(6\,.\,10)^2$ corresponds to 3600. This taken from 4356 leaves 756 which is equal to $(2\,.\,6\,.\,10 + 6)\,.\,6$. The arrangement is as follows:

$$\begin{array}{r|l} & \overset{*}{4}\ \overset{*}{3}\ 5\ 6 \mid 6\ 6 \\ & 3\ 6 \\ \hline 2\,.\,6\,.\,10 = 120 & \\ \quad + 6 & 7\ 5\ 6 \\ \hline 126 & 7\ 5\ 6 \end{array}$$

For a detailed explanation as to how to point off the number in periods, etc., see the section on square root in the article on arithmetic.

CUBE ROOT.

The rule for cubing a binomial, i.e.,

$$(a + b)^3 = a^3 + 3a^2b + 3ab^2 + b^3,$$

in like manner furnishes the basis for the solution of the problem; *To find the cube root of a polynomial.*

The above expression may be written in the following form, $a^3 + (3a^2 + 3ab + b^2)b$.

Hence, the cube root of the first term of the polynomial must be found by inspection. The second divisor is made up of $3a^2 + 3ab + b^2$, i.e., three times the square of the root already found, plus three times the root already found times the next number of the root (found by dividing the first term of the remainder by three times the square of the root already found), plus the square of the next number of the root.

The method of extracting the cube root of an arithmetical number is an adaption of this method.

EXAMPLE. Find the cube root of $27x^3 - 54x^2y + 36xy^2 - 8y^3$.

$$\begin{array}{rl|l} & 27x^3 - 54x^2y + 36xy^2 - 8y^3 & 3x - 2y \\ & 27x^3 & \\ \hline & & \\ 3a^2 = 3\,.\,(3x)^2 = 27x^2 & - 54x^2y + 36xy^2 - 8y^3 & \\ 3ab = 3\,.\,(3x)\,(-2y) = -18xy & & \\ b^2 = (-2y)^2 = 4y^2 & & \\ \hline \text{Adding} \quad 27x^2 - 18xy + 4y^2 & - 54x^2y + 36xy^2 - 8y^3 & \end{array}$$

RADICALS.

Def. A *radical expression*, or *radical*, is the indicated root of an algebraic expression. The small number written just above and to the left of the radical, called the *index*, indicates what root is to be taken. If no index is written, the square root is to be taken.

Def. The number under the radical sign is called the *radicand*.

E.g. In the radical expression $\sqrt{3ax}$, the radicand is 3ax.

Def. An expression is said to be *rational* if it can be expressed as a polynomial or as the quotient of polynomials.

E.g. 3ax, $5x^2 - 3$ and $ax + y$, are rational expressions.

Def. Any expression which is not rational is said to be *irrational*.

Def. A *surd* is a radical which cannot be reduced to a rational expression.

E.g. $\sqrt{3x}\,.\sqrt{x-1}\,.\sqrt{x^2 - ax + 4}$ are surds.

Def. The *order of a surd* or radical is the number of the root to be taken as indicated by the index.

E.g. $\sqrt{3ax}$ is a surd of the second order, sometimes called a quadratic surd. $\sqrt[3]{x+1}$ is a surd of the third order.

Def. The product of a rational factor and a surd is called a *mixed surd*.

E.g. $(x + 1)\sqrt{3x - 2}$ is a mixed surd.

Def. An *entire surd* is a surd which has no rational factor other than 1.

E.g. $\sqrt{x^2 - 3}$ is an entire surd.

Def. *To reduce a radical* is to change its form without changing its value.

To reduce a surd to its simplest form.

Factor the radicand so that one factor will be a perfect power of the same degree as the order of the radical. Extract the indicated root of all such factors, and write the product of these roots times the given root of the remaining factors.

EXAMPLE. Simplify

$$\sqrt[3]{32x^5y^4} = \sqrt[3]{8\,.\,x^5y^3\,.\,4y}$$
$$= \sqrt[3]{(2x^2y)^3}\,.\,\sqrt[3]{4y}$$
$$= 2x^2y\sqrt[3]{4y}\,.$$

EXAMPLE. Simplify $\sqrt[4]{625x^5y\,(x-y)^4}$

$$\sqrt[4]{625x^5y\,(x-y)^4} = \sqrt[4]{5^4x^4\,(x-y)^4}\,.\,\sqrt[4]{xy}$$
$$= 5x\,(x-y)\sqrt[4]{xy}$$

The above process makes use of the fact that the square root of a perfect square is the number, that the cube root of a perfect cube is the number, and in general the nth root of a perfect nth power of a number is the number itself. This problem is considered further in the section on exponents.

To reduce a mixed surd to an entire surd.

Raise the rational part of the expression to a power equal to the order of the radical. Multiply this result by the expression under the radical sign and write the result under the radical sign.

EXAMPLES. Reduce to entire surds.

$$b^2\sqrt{a^3} = \sqrt{b^4} \cdot \sqrt{a^3} = \sqrt{a^3b^4}$$

$$(a+b)\sqrt{\frac{1}{a+b}} = \sqrt{(a+b)^2} \cdot \sqrt{\frac{1}{a+b}}$$

$$= \sqrt{(a+b)^2 \cdot \frac{1}{(a+b)}} = \sqrt{a+b}.$$

Def. Two surds are said to be *similar* when they have the same index and the same radicand.

The introduction of radicals has led to a *new kind of number*. This calls for an examination as to the conditions under which and the ways in which these numbers can be added, subtracted, multiplied and divided.

The enlarging of the number system has removed many of the original restrictions governing the use of numbers. When dealing with integers in arithmetic, a number can be subtracted only from numbers as large or larger than itself, a number can be divided only by a factor of itself, while square roots can be taken of comparatively few numbers. *The introduction of fractions* makes it possible to divide any number by any other number. *The introduction of negative numbers in algebra*, makes it possible to subtract any number from any other number. *The introduction of radicals* and irrational numbers makes it possible to extract the square root of all positive numbers.

The two operations on which restrictions are still placed are division and extraction of roots. *Division by zero is not permitted at any time* In the number system as at present developed *the extraction of the square root of negative numbers is not possible.* This last exception is removed by the definition of a new number, called *the imaginary.* It is defined to be the number whose square is -1. The numbers in this enlarged number system are called *complex numbers.*

Much of present progress in scientific lines is made possible by the use of these numbers. The operations on complex numbers will not be studied here.

The operations on radicals or surds are greatly simplified by the introduction of fractional exponents.

EXPONENTS AND RADICALS.

Exponents originally indicated the number of times a number was to be taken as a factor, as x^2, a^5, etc.

Since an exponent is a number, the meaning of addition, subtraction, multiplication and division must be considered. This results in what are known as the laws of exponents.

Laws of exponents.

ADDITION. *To multiply two or more powers of the same quantity, add the exponents of the quantity in each factor and write the sum as the exponent in the product.*

$$a^p \cdot a^q \cdot a^r = a^{p+q+r}$$

EXAMPLE. Multiply $4a^2x^3y$ by $3ax^2y^2$.

$$4a^2x^3y \cdot 3ax^2y^2 = 12a^{2+1}x^{3+2}y^{1+2}$$

$$= 12a^3x^5y^3.$$

SUBTRACTION. *To divide powers of the same quantity, subtract the exponents of the quantity in the divisor from the exponent in the dividend and write the difference as the exponent in the quotient.*

$$a^m \div a^n = \frac{a^m}{a^n} = a^{m-n}$$

EXAMPLE. Divide $12a^3b^4$ by $2a^2b^6$.

$$\frac{12a^3b^4}{2a^2b^6} = 6a^{3-2}b^{4-6}$$

$$= 6ab^{-2}$$

MULTIPLICATION. *To raise the power of a quantity to a power, multiply the exponent of the quantity by the required power and write the result as the exponent of the quantity.*

$$(a^m)^n = a^{mn}$$

EXAMPLE. Simplify $(2ab^2x^3)^3$

$$(2ab^2x^3)^3 = 2^3a^3b^{2\cdot3}x^{3\cdot3}$$

$$= 8a^3b^6x^9$$

DIVISION. *To extract a root of a power of a quantity, divide the exponent by the index of the root and write the quotient as the exponent in the required root.*

$$\sqrt[n]{a^m} = a^{\frac{m}{n}}$$

EXAMPLE. Find the cube root of $27a^6b^3$

$$\sqrt[3]{27a^6b^3} = \sqrt[3]{27}\cdot a^{\frac{6}{3}}\cdot b^{\frac{3}{3}}$$

$$= 3a^2b.$$

It is always possible to add and multiply numbers, and also exponents.

It is necessary to define zero and negative exponents so that the subtraction of exponents is always possible. This was done in connection with the work on division of monomials.

If division of exponents is always to be possible, the idea of exponents must be farther extended. E.g. Following the rule for extracting roots by dividing the exponent, the following interesting result is obtained.

$$\sqrt{a^3} = a^{\frac{3}{2}}$$

Here, the exponent 3/2 is made to mean the square root of the cube of a. It may also be considered as the cube of the square root of a.

It can be shown without difficulty that the laws of exponents holds when the exponents, powers and indices are *any kind of algebraic number.*

Relation between radicals and exponents.

Obviously, the fractional notation furnishes a convenient means of writing radicals. Certain operations on radicals are made much easier by the use of this notation.

To reduce two radicals to the same index.

Replace the radicals by fractional exponents. Reduce the exponents to a common denominator, performing the indicated operations. Rewrite in radical form.

EXAMPLE. Reduce $\sqrt[3]{ax^2}$ and $\sqrt{ax^3}$ to radicals having a common index.

$$\sqrt[3]{ax^2} = (ax^2)^{\frac{1}{3}} = (ax^2)^{\frac{2}{6}} = \sqrt[6]{(ax^2)^2} = \sqrt[6]{a^2x^4}.$$

$$\sqrt{ax^3} = (ax^3)^{\frac{1}{2}} = (ax^3)^{\frac{3}{6}} = \sqrt[6]{(ax^3)^3} = \sqrt[6]{a^3x^9}.$$

Addition and subtraction of radicals.

Similar radicals can be combined in one radical by adding the rational parts and writing the algebraic sum as the coefficient of the common radical.

EXAMPLE. Combine $\sqrt{50} + 3\sqrt{72} - 4\sqrt{18}$.

$$\sqrt{50} = \sqrt{25.2} = 5\sqrt{2}$$
$$3\sqrt{72} = 3\sqrt{36.2} = 3.6.\sqrt{2} = 18\sqrt{2}$$
$$-4\sqrt{18} = -4\sqrt{9.2} = -4.3\sqrt{2} = -12\sqrt{2}$$
$$\therefore 5\sqrt{2} + 18\sqrt{2} - 12\sqrt{2} = 11\sqrt{2}$$

Multiplication of radicals.

To multiply radicals having a common index, multiply the product of the coefficients by the product of the radicands written under a radical with the common index.

Surds or radicals having different indices must be reduced to surds having a common index. This is best done by the use of fractional exponents.

EXAMPLE. Multiply $\sqrt{3}$ by $\sqrt{27}$.

$$\sqrt{3} \cdot \sqrt{27} = \sqrt{3.27} = \sqrt{81} = 9.$$

EXAMPLE. Multiply $\sqrt[3]{ax^2}$ by $\sqrt{a^3x}$.

$$\sqrt[3]{ax^2} = (ax^2)^{\frac{1}{3}} = (ax^2)^{\frac{2}{6}} = (a^2x^4)^{\frac{1}{6}} = \sqrt[6]{a^2x^4}$$
$$\sqrt{a^3x} = (a^3x)^{\frac{1}{2}} = (a^3x)^{\frac{3}{6}} = (a^9x^3)^{\frac{1}{6}} = \sqrt[6]{a^9x^3}$$

Therefore,

$$\sqrt[6]{a^2x^4} \cdot \sqrt[6]{a^9x^3} = \sqrt{a^2x^4 \cdot a^9x^3}$$
$$= \sqrt[6]{a^{11}x^7}$$
$$= ax\sqrt[6]{a^5x}.$$

EXAMPLE. Multiply $(a+\sqrt{x})$ by $(b-\sqrt{x})$

$$\begin{array}{r} a+\sqrt{x} \\ \hline b-\sqrt{x} \\ \hline ab+b\sqrt{x} \\ \hline -a\sqrt{x}-(\sqrt{x})^2 \\ \hline ab+(b-a)\sqrt{x}-x \end{array}$$ Product.

Division of radicals.

To divide monomial surds, having a common index, multiply the quotient of the coefficients by the quotient of the radicands written under a radical with the common index.

$$a\sqrt{x} \div b\sqrt{y} = \frac{a\sqrt{x}}{b\sqrt{y}} = \frac{a}{b} \cdot \sqrt{\frac{x}{y}}.$$

Monomial surds having different indices must be reduced to a common index by the use of fractional exponents.

EXAMPLE. Divide $\sqrt{8}$ by $\sqrt{24}$.

$$\frac{\sqrt{8}}{\sqrt{24}} = \sqrt{\frac{8}{24}} = \sqrt{\frac{1}{3}} = \frac{1}{\sqrt{3}} \cdot \frac{\sqrt{3}}{\sqrt{3}} = \frac{\sqrt{3}}{3}.$$

EXAMPLE. Divide x^3 by $\sqrt[3]{x}$.

$$\frac{x^3}{\sqrt[3]{x}} = \frac{x^3}{x^{\frac{1}{3}}} = \frac{x^{\frac{9}{3}}}{x^{\frac{1}{3}}} = x^{\frac{9}{3}-\frac{1}{3}} = x^{\frac{8}{3}} = \sqrt[3]{x^8}$$

When a divisor is a surd, especially if it is other than a monomial, it is best to write the indicated division as a fraction and then reduce it, when possible, to a fraction *whose denominator is rational.*

EXAMPLE. Rationalize the expression $x\sqrt{2ax}$.

The rationalizing factor is $\sqrt{2ax}$ since multiplying by this will make $\sqrt{2ax}$ rational.

$$x\sqrt{2ax} \cdot \sqrt{2ax} = x.2ax = 2ax^2.$$

This process is known as *rationalizing the expression.* It is accomplished in fractions by multiplying both terms of the fraction by an expression which will make the denominator a rational expression. The factor used in this process is called the *rationalizing factor.* It is determined by inspection.

When the divisor is a binomial, involving only the sum or difference of square roots, the demoninator is rationalized by multiplying by the same terms connected by the opposite sign.

EXAMPLE. Rationalize the denominator of $\dfrac{a+\sqrt{x}}{a-\sqrt{x}}$

Rationalizing factor $= a + \sqrt{x}$.

$$\frac{a+\sqrt{x}}{a-\sqrt{x}} \cdot \frac{a+\sqrt{x}}{a+\sqrt{x}} = \frac{a^2+2a\sqrt{x}+x}{a^2-x}$$

EXAMPLE. Rationalize the denominator of $\dfrac{\sqrt{x}-\sqrt{y}}{\sqrt{x}+\sqrt{y}}$

Rationalizing factor $= \sqrt{x} - \sqrt{y}$.

$$\frac{\sqrt{x}-\sqrt{y}}{\sqrt{x}+\sqrt{y}} \cdot \frac{\sqrt{x}-\sqrt{y}}{\sqrt{x}-\sqrt{y}} = \frac{x-2\sqrt{xy}+y}{x-y}.$$

GEOMETRY

1. Arithmetic. In the study of arithmetic, one learns to use numbers in particular computations. In connection with the work on mensuration and elsewhere, rules are given for finding areas, volumes, distances, weights and many other magnitudes. These rules are stated without any proof being offered. In some cases, the rules are made to look reasonable by actual examples in measuring. The number of pints in a gallon, the number of cubic inches in a cubic foot, the number of square yards in a carpet are often introduced in this way.

2. Algebra. In the study of algebra, one learns to use symbols and letters to indicate quantities that may take on many values in different problems and even in the same problem. By means of these letters and symbols, many of the rules used in arithmetic are stated in short general forms called formulas. If area is represented by A, the length of the base by b, the height by h, then the area of a rectangle is given by the formula; $A = b.h.$ Similarly, the area of a triangle is given by $A = \frac{1}{2}b.h.$ The area of a circle is stated; $A = \pi r^2$, where $\pi = 3.1416$ and r is the radius of the circle. No proof is attempted in algebra for relations of this kind.

3. Geometry. One comes now to a study of forms and to a proof of the rules and formulas used in arithmetic and algebra. The science which deals with the forms of bodies is called *Geometry*. It is one of the most ancient, and in many ways is the most elegant of the sciences. A brief history of the development of this subject will be of interest.

4. History of Geometry. The original meaning of the word, "geometry" was "measure of land," and, in this sense, we find the ancient Egyptians using the methods of the science in order to determine the equitable tax upon different plots of land as these changed with the annual inundation of the Nile. The Babylonians advanced beyond the areas of squares and rectangles to a consideration of the circumference and area of circles, calling the ratio between the diameter and the circumference three. In this connection, the writer of the Book of Kings says of the molten sea in the temple of Solomon that it was "ten cubits from brim to brim, round in compass, . . . and a line of thirty cubits compassed it round about." (1 Kings 7:23).

So far as is known, these early peoples were interested in the applications of geometry to the pressing problems of peace and war. In war, to solve the problems of destruction that would aid in conquest or protect in case of hostile attack. In peace, to erect pyramids and towers, buildings and monuments, that still stand as memorials to the greatness of their achievements.

The Greek mind was impressed not only with the practical value of geometry but even more with the beauty of its logic and the certainty of its conclusions. From Thales and Protagoras to Plato and Aristotle we find their philosophers examining, adding to and perfecting the subject. Plato causes Socrates to find a recognition or "recollection" of the truths of geometry in the mind of an untutored slave, and argued from this that, as the slave could not possibly have learned these facts from any one else, his mind must have contained these ideas from the beginning. This served as one of his arguments in support of the theory of innate ideas, a philosophy of thought that has had a great influence on the thinking of men in all succeeding times.

The achievements of the Greek mind in the field of geometry were collected and arranged by Euclid in the closing years of the fourth century B. C. His famous work was called the "Elements," a treatise containing fifteen "books," in which he developed the axioms, postulates and theorems of plane geometry in a form that has been little changed by time. Throughout 2200 years the study of geometry has held so high a place in the opinions of educators that they have continued to write over the entrance to higher education as Plato wrote over the door of the Academy in ancient Athens,

"Let none enter here without a knowledge of geometry."

5. Plane geometry was originally limited to a study of those forms which can be drawn with an unmarked ruler or straightedge and compasses. Some recent additions have left the field rather undefined so that writers on the subject are not in complete agreement as to what should and what should not be included in the subject. It is still made up in the main of the work set forth in Euclid's "Elements" and the mensuration of the circle, to which is added some work on the problems of loci or paths of moving points.

6. Much progress has been made in the study of other forms in the plane and in space. René Descartes joined algebra to geometry in the sixteenth century and laid the foundations for modern analytical geometry and the related fields of projective and descriptive geometry. More recently, the use of the calculus has given us new fields of study and the branch of the science known as differential geometry.

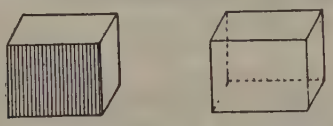
7. The field of mathematics naturally divides itself into the analytical, the geometrical, and the applied. The first of these begins with the theory of numbers in arithmetic and algebra. The second is first considered in plane geometry. The applications of both these branches of mathematics are begun in arithmetic. It is unfortunate that these various subjects are not studied together so that the relation between them could be observed. Many efforts are being made along this line both in this country and in Europe. The movement abroad has met with considerable success but no satisfactory combined course is yet available in this country. This tendency has helped a great deal, however, in bringing about many improved methods of presentation of the subjects in both the classrooms and the textbooks.

8. Plane geometry is and will continue for some time to come to be the main way of approach to a thorough understanding of mathematics. Apart from the importance of its theorems; the practice given the student in separating the essential from the non-essential,

the training given in thinking in an accurate and orderly manner, the ability trained to recognize a sufficient and completed proof, and other benefits will continue to recommend its study.

9. Geometry lays a careful foundation for itself. The terms used are defined with all the accuracy and precision possible. All statements made are either proved from the preceding statements and definitions, or the cause of accepting them as true is made clear. Some of these statements have to be accepted as true without proof. All such are carefully examined and stated for reference.

10. Certain of the terms used do not admit of satisfactory definition. Unless the student has a knowledge of the meaning of the words, point line, and plane, the pages of geometry will be unintelligible to him. These are called the *elements* of geometry and experience must help us to understanding of their meaning. The child playing with his blocks, balls, and



wheels is laying the foundations on which later we will erect his knowledge of our science. From his idea of a box, we will lead him naturally to the idea of the form of the box and so to a knowledge of the forms and elements that make up the same.

11. **Plane.** One side of the box is a square or rectangle. The sides of the box, being flat, are called *surfaces*, or *plane surfaces*. A plane surface extended indefinitely in every direction is called a *plane*.

In plane geometry, we have to do only with figures which lie in a plane. They have no thickness. They do have length and breadth. These are called the *dimensions* of the figure. Any figure in a plane is a plane figure. It cannot have more than two dimensions.

12. **Line.** Plane figures are composed of parts, which are called *lines*. The edge of the box extended in each direction is called a *line*. A line has only one dimension, which is length. Any part of a line such as is formed by the edge of the box produced is called a *straight line*. Any part of it can be placed on any other part and they will coincide. The child learns early that not all lines are straight.

13. **Point.** Two lines meet in a *point*. The corners of the box represent points. They have location or position, but no dimensions. We say, a point has neither length, breadth, nor thickness.

14. The statements used in geometry, the proof of which is not given, are of two kinds. The first are those that relate themselves to the whole field of mathematics most of which have been noticed and used in arithmetic and algebra. The second group consists of statements that have to do with relations between geometrical elements. Most of these relations are so evident that it is not difficult to lead one to accept them without question.

15. **Def.** An *Axiom* is a statement dealing with magnitudes in general that is accepted as true without proof.

16. **Def.** A *Geometrical Axiom or Postulate* is a statement dealing with geometrical magnitudes that is accepted as true without proof.

17. **Axioms.** Much work has been done in an attempt to determine the necessary axioms and postulates of geometry. In a properly selected list, no one axiom or postulate will depend upon another. None of them can be proved true or untrue. They are like the rules of a game. They may be changed by agreement, but, once they are accepted, the nature of the game is determined. So, in geometry, once the axioms and postulates are agreed upon, the conclusions follow in logical sequence. Much investigation has been undertaken to determine the nature of the science that would follow if certain of the axioms and postulates were assumed false and other statements substituted in their places. These studies do not concern us at this time.

It is sufficient to remember that while most of these statements seem true, our acceptance of them is voluntary. It is interesting to note that the Theory of Relativity, about which the scientists of the world are so concerned at present, is based upon assumptions the truth of which is not yet accepted by many people. In a case of this kind, as in all cases, the real test of the assumptions is the validity of the conclusions reached by their use.

18. The general axioms have already been used in algebra but they are stated here for reference.

Ax. 1. Things which are equal to the same thing, or to equal things, are equal to each other.

Ax. 2. If equals are added to equals the results are equal

Ax. 3. If equals are taken from equals the results are equal.

Ax. 4. If equals are taken an equal number of times, i. e. are multiplied by equals, the results are equal.

Ax. 5. If equals are divided into an equal number of parts, i. e. divided by equals, the results are equal.

From this and axiom 1 it follows that the parts are all equal to each other.

Division by zero is not permissible.

Ax. 6. The whole is equal to the sum of all its parts.

Ax. 7. The whole is greater than any of its parts.

Ax. 8. Any quantity may be substituted for its equal in a mathematical expression.

Ax. 9. If unequals are operated on by positive equals, the results are unequal in the same order.

If $a < b$, read, a less than b,
and $c = d$,
Then $a + c < b + d$
$a - c < b - d$
$a \times c < b \times d$
$\frac{a}{c} < \frac{b}{d}$

and similarily for a greater than b, written $a > b$.

Ax. 10. If unequals are subtracted from equals, the results are unequal in the reverse order.

If $a = b$ and $c > d$,
Then $a - c < b - d$.

Ax. 11. If, of three quantities, the first is greater than (less than) the second and the second is greater than (less than) the third, then the first is greater than (less than) the third.

If $a > b$ and $b > c$,
Then $a > c$.

19. Def. A *straight line* is a line which has the same direction throughout its whole extent. A straight line will lie entirely in a plane surface even when the line is turned over and over. A straight line is the intersection of two planes.

20. Def. A *broken line* is a line made up of two or more straight lines.

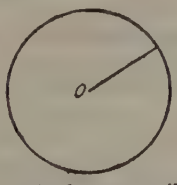
21. Def. A *curved line* is a line no part of which is straight. A part of the edge of a wheel is a curved line. The direction of a curve changes at every point. The part of a curve between two points is called an *arc*.

22. Def. A *rectilinear figure* is a figure formed by a broken line. Eg. A square is a rectilinear figure.

23. Def. The portion of a straight line between two points is called a *line segment* or simply a *segment*.

24. Def. Associated with every line segment is a unique element or value called its *length*. This length is measured in terms of units. Hence, the same length may be represented by several different numbers depending on the units used. For example, a segment 1 yard long, may be spoken of as 3 feet, 36 inches, or as a fractional part of some longer unit.

25. Def. A *curvilinear figure* is a figure bounded by curved lines. In plane geometry, one considers only those curves which can be drawn with the compasses.



26. Def. A *circle* is a curvilinear figure in which every point of the curve is equally distant from a fixed point within it. The fixed point is called the *center* of the circle. The curved line is called the *circumference*. A line segment from the center to the circumference is called a *radius*.

It is evident that a circle is the only curvilinear figure which can be drawn with the compasses. For this reason, figures bounded by circles and parts of circles are the only curvilinear figures treated in this section.

27. Postulates. The following geometrical axioms or postulates can now be stated.

Post 1. One and only one straight line can be drawn between two points.

This fact may also be stated as follows:

Two points determine a line.

Post. 2. A straight line may be extended indefinitely in either direction.

In the following, the word line is used to signify straight line unless the contrary is stated.

Post. 3. The length of the segment between two points is the shortest distance between them.

Post. 4. A geometrical figure may be moved from place to place without changing its size or shape.

Post. 5. A circumference may be drawn with any point as center and any line segment as radius.

28. Def. Two geometric figures are said to be *congruent* if one can be placed upon the other in such a way that they coincide in all their parts. Symbol $\cong$.

29. Def. When two geometric figures are congruent, the parts and magnitudes of the figures which coincide when one is placed upon the other are called *corresponding or homologous parts*.

Without writing out detailed proofs, the following statements will be recognized as true.

30. *Corresponding magnitudes of congruent figures are equal.*

31. *Congruent figures are equal.*

32. *Two circles having equal radii are congruent.*

33. *If two circles are equal, their circumferences are equal and their radii are equal.*

34. Def. A point O divides a line into the two parts OA and OB, called *half lines* or *rays*.

The point O is the *end point* of the ray OA and also of the ray OB. The ray extends indefinitely in one direction from its end point.

35. Def. An *angle* (Symbol $\angle$ or $\measuredangle$) is the figure formed by two rays having a common end point. This point is called the *vertex* of the angle. The rays are called the *sides* of the angle.

When no confusion results, we designate an angle by its vertex, and write $\angle$ O. At other times, we indicate a point on one ray, the vertex, and a point on the other ray, and write $\angle$ AOB. At other times it is more convenient to place a number or letter within the angle, and write $\angle$ 1.

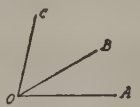
36. Def. Two angles which are congruent are said to be *equal*, and it follows that *equal angles are congruent*.

37. Def. The *bisector* of a geometric magnitude is the element, point, line or plane, which divides it into two equal parts.

38. In considering the size of angles, we think of the amount of turning necessary to bring one side into the position of the other. It is evident that the size of an angle does not depend on the length of its sides.

39. Def. A *straight angle* is the angle between the half lines or rays of a given line.

40. Def. Two angles are said to be *adjacent* when they have the same vertex and a common side between them.



In the figure ∠ AOB is adjacent to ∠ BOC.

41. Def. When two lines meet in such a way that the two adjacent angles are equal, each of these angles is called a *right angle.* Symbol, rt. ∠.

42. Def. Two lines are said to be *perpendicular* to each other if they form a right angle with each other. Each line is called a *perpendicular.* Symbol ⊥.

OB ⊥ CA

43. Def. An *acute angle* is an angle less than a right angle.

44. Def. An *obtuse angle* is an angle greater than a right angle and less than a straight angle.

At present we will not consider angles larger than a straight angle.

45. The geometrical axiom for angles may now be stated.

Post. 6. All right angles are equal.

46. The following statements follow so directly from the preceding that no proof is stated for them.

1. Two points determine a line.

2. Two straight lines can intersect in only one point.

3. A segment can be bisected by only one point.

4. A straight angle equals two right angles.

5. All straight angles are equal.

6. At a given point on a given line only one perpendicular can be drawn to that line.

If two can be drawn at a point, they make two right angles. But all right angles are equal by Post. 6. Hence the angles are congruent and the two lines coincide.

47. Def. If the sum of two angles is equal to a right angle, each angle is called the *complement of* the other and the angles are said to be *complementary.*

48. Def. If the sum of two angles is equal to a straight angle, each angle is called the *supplement* of the other and the angles are said to be *supplementary.*

49. Def. The sum of all the successive adjacent angles about a point is called a *perigon* and is equal to two straight angles or four right angles.

50. Def. The unit commonly used in measuring angles is the *degree* which is defined by the statement "360 degrees are equal to one perigon." Symbol 360°. From this it follows that a straight angle equals 180° and a right angle equals 90°. Each degree is divided into sixty equal parts called *minutes.* Symbol 60′. Each minute is divided into sixty equal parts called *seconds.* Symbol 60″.

See that the following statements are true.

51. *Complements or supplements of the same or equal angles are equal.*

52. *If two adjacent angles have their exterior sides lying in the same straight line, they are supplementary.*

53. *If two adjacent angles are supplementary, their exterior sides lie in the same straight line.*

54. Def. In the last two statements the conclusion of one is the premise of the other. When statements are related in this way, one statement is said to be the *converse* of the other. The converse of a true statement is not always true. It must be examined carefully in every case.

55. Def. *Vertical angles* are angles which have a common vertex the sides of one angle being the extension of the sides of the other.

We shall now consider the nature of the formal proof of a geometrical statement in connection with the following example.

56. *Theorem 1. If two lines intersect, the vertical angles are equal.*

Given. Lines AB and CD intersecting at O forming the vertical ∠s AOC and BOD.

To be proved. ∠ AOC = ∠ BOD.

Proof. ∠ AOC is the supplement of ∠ BOC. Par. 52.

(*If two adjacent angles have their exterior sides lying in the same straight line, they are supplementary.*)

Likewise, ∠ BOD is the supplement of ∠ BOC.

∴ ∠ AOC = ∠ BOD q. e. d. Par. 51.

(*Supplements of the same angle are equal.*)

57. Def. *A theorem* is a geometrical statement to be proved. When formally stated, a theorem consists of two parts, the *hypothesis* and the *conclusion.* The hypothesis states the special conditions that are assumed as true for the case under consideration, the conclusion states a fact that results from them.

58. The Nature of Proof. Much of the value of a study of geometry comes from an appreciation of what constitutes an exact proof. There are certain rather clearly defined steps in any consistent process of thought. The formal proof of a geometric theorem makes these steps clear and distinct. In writing out a proof of a theorem the following procedure should be followed.

1. Write down a general statement of the theorem.

2. Draw a figure showing all the facts stated in the hypothesis. All the drawing necessary in plane geometry can be done with an un-marked ruler and a pair of compasses. For convenience, an instrument called a protractor is sometimes used to measure and construct angles but no figure is allowed that requires its use. The points, lines, angles, etc., should be lettered or marked in some way so that they can be referred to readily.

3. *Given.* Under this title state the facts given in the hypothesis in terms of the figure.

4. *To be proved.* Under this title state the facts of the conclusion in terms of the figure.

5. *Proof.* Explain any additional construction that may be necessary. State such relations as are needed which are true in the figure as drawn. State the definition, axiom, postulate, or theorem which proves each such statement. These are called the reasons for the statements. In a complete proof, every such reason is stated in full.

6. These statements are to be so selected that they lead up to a restatement of the conclusion. This is usually preceded by the symbol ∴ meaning "therefore," and is followed by the letters q. e. d. which is an abbreviation for the Latin phrase "*quod erat demonstrandum*," meaning "*which was to be proved.*"

59. Def. A *problem* is a construction to be made. As mentioned above, only the rule and compasses should be used.

60. Def. When certain known or accepted truths are put together in such a way that they lead up to the conclusion as in Theorem 1, the proof is said to be *synthetic.*

TRIANGLES

60. Def. A *triangle* is a rectilinear figure composed of three line segments called *sides.* Symbol △ and ▲.

A triangle in general is *scalene.*

If two of its sides are equal, it is *isosceles.*

If all its sides are equal, it is *equilateral.*

Triangles are also named from the nature of the angles.

If all the angles are acute, the triangle is *acute.*

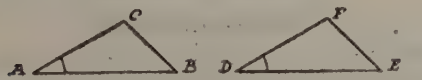
If one angle is obtuse, the triangle is *obtuse.*

If one angle is a right angle, the triangle is a *right triangle.*

If all the angles are equal, the triangle is *equiangular.*

Any side of a triangle may be taken as the *base* of the triangle. The angle opposite the base is the *vertical angle* of the triangle. Its vertex is the *vertex* of the triangle.

62. *Theorem 2. If two triangles have two sides and the included angle of one equal respectively to two sides and the included angle of the other, the triangles are congruent.*



Given. In ▲ ABC and DEF; AB = DE, AC = DF, ∠ A = ∠ D.

To be proved. △ ABC ≅ △ DEF.

Proof. Place △ DEF on △ ABC in such a way that point D will fall on point A and side DE will fall along side AB. Post. 4

(A figure may be moved from place to place without changing its size or shape.)

Point E will fall on point B. Given.

(Since AB = DE.)

Side DF will fall along side AC. Def.

(∠ A = ∠ D and equal angles are congruent.)

Point F will fall on point C. Given.

(Since DF = AC.)

∴ EF will coincide with BC. Post 1.

(One and only one straight line can be drawn between two points.)

∴ △ DEF coincides with △ ABC

∴ △ ABC ≅ △ DEF q. e. d. Def.

(Two geometric figures are said to be congruent if one can be placed upon the other in such a way that they coincide in all their parts.)

63. Def. When a theorem is proved by placing one figure on another as in the above, the method is called *proof by superposition.*

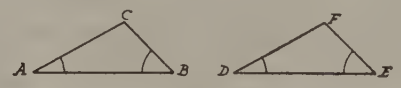
64. Def. In a right triangle, the side opposite the right angle is called the *hypothenuse*, and the other sides are called *legs or sides.*

Corol. Two right triangles are congruent, if the legs of one are equal respectively to the legs of the other.

The right angles are equal by Postulate 6 and the corollary is a special case of the preceding theorem.

65. Def. A statement which follows readily from a preceding one is called a *corollary.* Often a corollary simply restates the theorem in different form.

66. *Theorem 3. If two triangles have two angles and the included side of one equal respectively to two angles and the included side of the other, the triangles are congruent.*



Given. In ▲ ABC and DEF; ∠ A = ∠ D, ∠ B = ∠ E, and AB = DE.

To be proved. △ ABC ≅ △ DEF.

Proof. Place △ DEF on △ ABC in such a way that line DE will coincide with its equal AB. Post. 4.

(A figure may be moved from place to place without changing its size or shape.)

Then DF will fall along AC and EF along BC. Given.

(Since ∠ A = ∠ D and ∠ B = ∠ E.)

∴ Point F will fall on point C. Par. 48, 2.

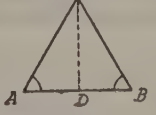
(Two straight lines can intersect in only one point.)

∴ The triangles coincide in all their parts.

∴ △ ABC ≅ △ DEF. q. e. d. Def.

(Two geometric figures are said to be congruent if one can be placed upon the other in such a way that they coincide in all their parts.)

67. *Theorem 4. If a triangle is isosceles, the angles opposite the equal sides are equal.*



Given. △ ABC is isosceles.

To be proved. ∠ A = ∠ B.

Proof. Draw line CD bisecting ∠ C. See below.

Then in ▲ ACD and BCD

AC = BC. Given.

(If two sides of a triangle are equal, the triangle is isosceles.)

CD = CD

(Common to both triangles.)

and ∠ ACD = ∠ BCD By construction.

(The bisector of a geometric magnitude, is the element which divides it into two equal parts.)

$\therefore \triangle ACD = \triangle BCD.$ Theo. 2.

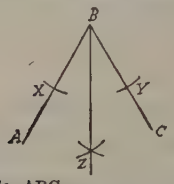
(If two triangles have two sides and the included angle of one equal respectively to two sides and the included angle of the other, the triangles are congruent.)

$\therefore \angle A = \angle B.$ q. e. d. Par. 30.

(Corresponding magnitudes of congruent figures are equal.)

In the above proof, it is necessary to draw the bisector of an angle. This construction is explained here but the proof is deferred till later.

68. *Problem 1. To bisect an angle.*



Given. The angle ABC.

Required. To draw the bisector of $\angle$ ABC.

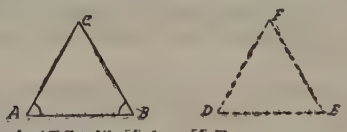
Construction. With B as center and any length as radius draw an arc of a circle cutting BA at X and BC at Y.

With X and Y as centers and the same radius as before draw arcs which intersect at the point Z.

Draw the line BZ.

This is the required bisector.

69. *Theorem 5. (Converse of Theorem 4.) If two angles of a triangle are equal, the triangle is isosceles.*



Given. $\triangle$ ABC with $\angle A = \angle B$.

To be proved. AC = BC.

Proof. Suppose $\triangle$ DEF is a reproduction of $\triangle$ ABC so that the corresponding parts are equal.

Place $\triangle$ DEF on $\triangle$ ABC in such a way that point E will fall on A and Point D will fall on B. Post. 4.

Since $\angle A = \angle B$ Given.

and $\angle B = \angle E$ By. Con.

$\therefore \angle A = \angle E$ Ax. 1.

(Things which are equal to the same thing or to equal things are equal to each other.)

Similarly $\angle B = \angle D$.

$\therefore$ Side EF will lie along AC and DF along BC. Def.

(Equal angles are congruent.)

$\therefore$ Point F will fall on C. Par. 46.

(Two straight lines can intersect in only one point.)

$\therefore EF = AC$

(Corresponding parts of congruent figures are equal.)

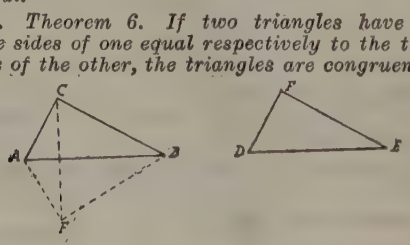
But $EF = BC.$ By Const.

$\therefore AC = BC.$ q. e. d. Ax. 1.

70. *Corollary. Equilateral triangles are also equiangular and conversely.*

The proof follows directly from the two preceding theorems. For brevity, if a theorem and its converse are both true, the statement may be made as above. The student should be careful to state the converse theorem and prove it as a separate proposition. The converse statement of the above is, *equiangular triangles are also equilateral.*

71. *Theorem 6. If two triangles have the three sides of one equal respectively to the three sides of the other, the triangles are congruent.*



Given. In $\triangle$ ABC and DEF; AB = DE, AC = DF, BC = EF.

To be proved. $\triangle$ ABC $\cong$ $\triangle$ DEF.

Proof. Place $\triangle$ DEF on $\triangle$ ABC so that side DE will coincide with its equal AB with D on the point A and E on B, the point F falling at the point F′ opposite to the vertex C.

Draw the line CF′.

Since AC = AF′ Given.

the triangle ACF′ is isosceles and Def.

$\angle ACF' = \angle AF'C$ Theo. 4.

(If a triangle is isosceles, the angles opposite the equal sides are equal.)

Similarly $\angle BCF' = \angle BF'C$

$\therefore \angle ACF' + \angle BCF' = \angle AF'C + \angle BF'C$ Ax. 2.

(If equals are added to equals, the results are equal.)

$\therefore \angle ACB = \angle AF'B$ Ax. 8.

(Any quantity may be substituted for its equal in a mathematical expression.)

$\therefore \triangle ABC \cong \triangle ABF'$ Theo. 2.

$\therefore \triangle ABC \cong \triangle DEF.$ q. e. d. Ax. 8.

From now on, a full statement of the reasons for each step of the proof will at times be omitted but the student should supply them in every case.

72. *Problem 2. To construct a triangle, given its three sides.*

Given. The lines a, b and c.

Required. To construct a triangle with these lines as sides.

Construction. On any line, lay off with the compasses the segment AB equal to c.

With A as center and b as radius draw an arc.

With B as center and a as radius draw a second arc intersecting the first at the point C.

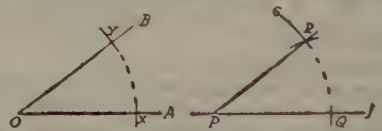
Draw AC and BC.

$\triangle$ ABC is the required triangle.

Why?

EXERCISE. Give the proof for Problem 1.

73. *Problem 3. At a given point on a given line, to construct an angle equal to a given angle.*



Given. $\angle$ AOB and point P on line L.

Required. To construct an angle at P equal to $\angle$ AOB.

Construction. With O as center and any line as radius, draw an arc cutting OA at X and OB at Y.

With P as center and the same radius draw an arc QS cutting L at the point Q.

With Q as center and a radius equal to the length of the segment XY, draw an arc cutting the arc QS at R.

Draw PR.

$\angle$ QPR is the required angle.

Proof. Draw XY and QR.

In the $\triangle$ OXY and PQR, we have

$OX = PQ.$

and $OY = PR.$ Par. 33,

(Radii of the same or equal circles are equal.)

and $XY = QR$ Const.

$\therefore \triangle OXY = \triangle PQR.$ Theo. 6.

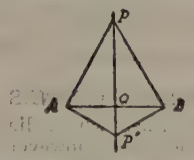
(If two triangles have the three sides of one equal respectively to the three sides of the other, the triangles are congruent.)

$\therefore \angle QPR = \angle AOB.$ Par. 30.

PERPENDICULARS.

73. Def. A line perpendicular to a segment at its mid point is called the *perpendicular bisector* of the segment.

74. *Theorem 7. If two points are each equally distant from the end points of a segment, they determine the perpendicular-bisector of the segment.*



Given. The points P and P' each equally distant from the ends of the segment AB.
To be proved. The line PP' is the ⊥ bisector of AB.
Proof. Draw the lines as indicated in the figure with PP' cutting AB at O.
In △ APP' and BPP',

	AP = BP.	Given.
	AP' = BP'	Given.
and	PP' = PP'	Common.
	∴ △ APP' ≅ △ BPP'	Theo. 6.
	∴ ∠ APP' = ∠ BPP'	Par. 30.
Then	△ APO ≅ △ BPO.	Theo. 2.
	∴ AO = OB	Par. 30.

and PP' bisects AB. q. e. d.

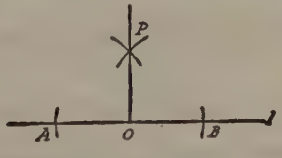
Also	∠ AOP = ∠ BOP.	Par. 30.
	∴ PP' ⊥ AB. q. e. d.	Def.

(When two lines meet in such a way that the two adjacent angles are equal, each of these angles is called a right angle and the lines are said to be perpendicular.)

75. *Problem 4. To construct the perpendicular bisector of a segment.*

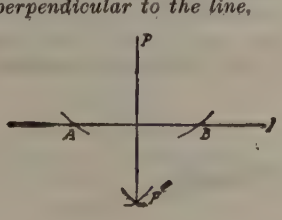
Given. The segment AB.
Required. To construct the perpendicular bisector of AB.
Construction. With A and B as centers and with the same radius draw arcs of circles intersecting each other in points P and P'.
The line PP' is the required line.
Why? Write out a complete proof.

76. *Problem 5. At a point on a line, to construct a perpendicular to the line.*



Given. The point O on the line l.
Required. To construct a line ⊥ to l at O.
Construction. With O as center and any length as radius draw a circle cutting l in points A and B.
Construct the perpendicular bisector of AB.
It is only necessary to locate the point P.
Why?
Write out a complete proof.

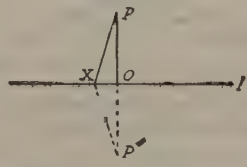
77. *Problem 6. From a point not on a line, to drop a perpendicular to the line.*



Given. The point P not on the line l.
Required. To drop a perpendicular from P to l.
Construction. With P as center and a line sufficiently long as radius, draw an arc cutting l in points A and B.
Using this or some convenient radius, construct the perpendicular bisector of AB.
This is the required line.
Prove.

78. In construction problems, it is best to set the compasses as few times as possible. Also, in determining a line, but two points are necessary. In the last two problems, directions are given to determine only two points. All figures should be drawn neatly and accurately. In this way the figure will help to make the proposition *"look true."*

79. *Theorem 8. One and only one perpendicular can be drawn from a point outside a line to that line.*



Given. Point P not on line l.
To be proved. One and only one line can be drawn ⊥ to l from P.
Proof. By Problem 6 above one such line PO, can be drawn.
Suppose the theorem not true.
Suppose PX is another ⊥ to l.
Prolong PO to P' so that PO = OP'.
Draw XP'.
By construction POP' is a straight line.
∴ PXP' is not a straight line. Post. 1.
(One and only one straight line can be drawn between two points.)
In rt. △ POX and P'OX,

	PO = OP'	By Const.
	OX = OX.	Common.
	∴ △ POX = △ P'OX.	Theo. 2. Cor.

(Two right triangles are congruent, if the legs of one are equal respectively to the legs of the other.)

and	∠ PXO = ∠ P'XO = Rt. ∠.	Hyp.
	∴ ∠ PXP' = 2∠ PXO = St. ∠.	

But this is impossible since PXP' is not a straight line.
Hence the assumption of a second perpendicular leads to a contradiction. Since all other steps in the proof are correct, the assumption must be false.
∴ PX is not ⊥ to l, q. e. d.

80. In proving a theorem, assumptions are often made and, in referring statements which follow to them, they are said to be true by *Hypothesis.* When the assumption leads to a contradiction of the axioms or postulates or previously accepted propositions, we are forced to deny the assumption and affirm its opposite. Such a method of proof is called *proof by reductio ad absurdum.*

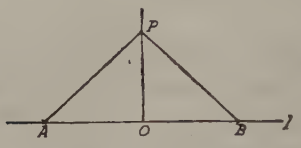
The above theorem may be proved directly by drawing the line PX as any other line from P to l. The indirect method is given here to illustrate a kind of proof that is often valuable.

81. *Theorem 9. The perpendicular is the shortest line that can be drawn from a point to a given line.*

Suggestion. From the figure in Theorem 8 we see that it is only necessary to prove PO less than PX. But they are respectively half of the distances POP' and PXP'. By Post. 3, POP' < PXP'. Ax. 5.

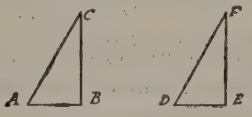
The length of the perpendicular from a point to a line is called *the distance from the point to the line.*

82. *Theorem 10. If two lines drawn from a point in a perpendicular to a given line cut off on the given line equal distances from the foot of the perpendicular, they are equal and make equal angles with the perpendicular.*



Given. PO ⊥ line l, and PA and PB cutting off equal segments OA and OB.
To be proved. AP = BP
and ∠ APO = ∠ BPO.
Proof. △ AOP and BOP are rt. △. Given.
and AO = OB. Given.
Also OP = OP. Common.
∴ △ AOP ≅ △ BOP. Theo. 2 Corol.
∴ PA = PB
and ∠ APO = ∠ BPO. q. e. d. Par. 30.
(Corresponding parts of congruent figures.)

83. *Theorem 11. Two right triangles are congruent if the hypothenuse and an adjacent angle of one are equal respectively to the hypothenuse and an adjacent angle of the other.*



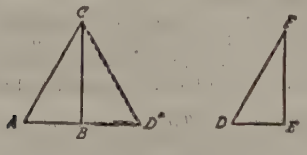
Given. Rt. △ ABC and DEF with AC = DF and A = D.
To be proved. △ ABC ≅ △ DEF.
Proof. Place △ DEF on △ ABC in such a way that DF coincides with its equal AC, point D falling on A and F on C.
Then, since ∠ A = ∠ D, DE will fall along AB.
Also, the line EF will fall along BC. Theo. 8.
(One and only one perpendicular can be drawn from a point outside a line to that line.)
∴ Point F will fall on point C. Par. 46.
∴ △ ABC ≅ △ DEF. q. e. d. Par. 28.

84. Def. It will be proved that in a right triangle the angles other than the right angle are both acute. They are called the *acute angles* of the triangle. We can now combine the above theorem and theorem 3 to prove the following.

85. *Corol. Two right triangles are congruent if a side and an acute angle of one triangle are equal respectively to a side and an acute angle of the other.*

Write out formal proof.

86. *Theorem 12. Two right triangles are congruent if the hypothenuse and a leg of one are equal respectively to the hypothenuse and a leg of the other.*



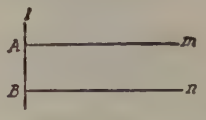
Given. Rt. △ ABC and DEF, with AC = DF, and BC = EF.
To be proved. △ ABC ≅ △ DEF.
Proof. Place △ ABC and DEF together in such a way that BC coincides with its equal EF, A and D' being on opposite sides of this common line.
Then ABD' is a straight line. Par. 53.
(If two adjacent angles are supplementary, their exterior sides lie in the same straight line.)
How do we know that ∠ ABC and ∠ BCD' are supplementary?
In the triangle AD'C, AC = D'C. Given.
∴ ∠ A = ∠ D' Theo. 4.
(If a triangle is isosceles, the angles opposite the equal sides are equal.)
∴ ∠ A = ∠ D Ax. 1.
∴ △ ABC ≅ △ DEF. q. e. d. Theo. 11.
(Two right triangles are congruent if the hypothenuse and acute angle of one are equal respectively to the hypothenuse and an acute angle of the other.)

PARALLEL LINES.

87. Def. Two lines which lie in the same plane and do not meet, however far they are extended, are called *parallel lines.* Symbol ∥.

The existence of such lines is shown in the following theorem.

88. *Theorem 13. Two lines in the same plane perpendicular to the same line are parallel.*



Given. Lines m and n ⊥ l, at A and B respectively.
To be proved. m ∥ n.
Proof. Assume that the lines will meet at some point, as X, if the lines are sufficiently produced.
This would give us two perpendiculars from a point outside a line to that line which is impossible by Theo. 8.
The assumption must be false.
∴ m and n do not meet.
∴ m ∥ n. q. e. d. Def. Par. 87.

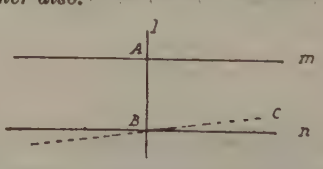
89. There has been a great deal of study and investigation in recent years into the significance of the *parallel axiom.* It may be stated as follows:

Post. 7. *Postulate of parallels. Through a given point only one line can be drawn parallel to a given line.*

90. *Corol. Two lines each parallel to a third line are parallel to each other.*

In plane geometry all three lines are considered as lying in the same plane but this statement is true in general as may be seen by referring to the box in Par. 1. There, four edges extending in the same direction are all parallel to each other but only two lie in any one plane.

91. *Theorem 14. If a line is perpendicular to one of two parallel lines, it is perpendicular to the other also.*



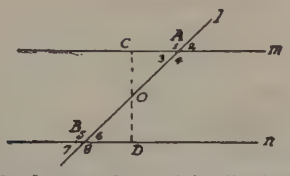
Given. Lines m ∥ n, and l ⊥ m, at A and cutting n at B.
To be proved. l ⊥ n.
Proof. At B draw BC ⊥ l.
Then BC ∥ m. Theo. 13.
(Two lines in the same plane perpendicular to the same line are parallel.)
But m ∥ n. Given.
∴ BC and n must coincide. Post. 7.
∴ l ⊥ n. q. e. d. By Const.

92. Def. A line which cuts two or more lines is called a *transversal of those lines.*

If two lines are cut by a transversal eight angles are formed which are designated as follows:

∠s 3, 4, 5 and 6 are called *interior angles.*
∠s 1, 2, 7 and 8 are called *exterior angles.*
∠s 3 and 6 are called *alternate-interior angles,* so also ∠s 4 and 5.
∠s 1 and 8 are called *alternate-exterior angles,* so also ∠s 2 and 7.
∠s 2 and 6, 1 and 5, 3 and 7, 4 and 8 are called *corresponding angles.*

93. *Theorem 15. If two parallel lines are cut by a transversal, the alternate-interior angles are equal.*



Given. The ∥s, m and n, cut by the transversal l at the points A and B respectively.
To be proved. ∠ 3 = ∠ 6 and ∠ 4 = ∠ 5.
Proof. Through O, the mid-point of AB draw CD ⊥ m.
Then CD ⊥ n. Theo. 14.
(A line perpendicular to one of two parallel lines is perpendicular to the other also.)
By construction, △s AOC and BOD are rt △s.
Also ∠ AOC = ∠ BOD. Theo. 1.
and AO = OB Const.
∴ △ AOC ≅ △ BOD Theo. 11
∴ ∠ OAC = ∠ OBD Par. 30.
or ∠ 3 = ∠ 6 q. e. d.
and ∠ 4 = ∠ 5 q. e. d. **Par. 51.**
(Supplements of equal angles are equal.)

94. *Corol. 1. If two parallel lines are cut by a transversal, the corresponding angles are equal.*

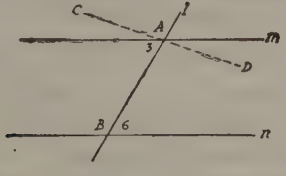
In the figure ∠s 2 and 3 are vert. ∠s and equal, while ∠ 3 = ∠ 6 by the above theorem. A similar discussion holds for each pair of corresponding angles.

95. *Corol. 2. If two parallel lines are cut by a transversal the two interior (exterior) angles on the same side of the transversal are supplementary.*

In this case, ∠s 2 and 4 are supplementary and ∠ 2 = 6 by the preceding corollary. Therefore, ∠s 4 and 6 are supplementary.

96. *Corol. 3. If two parallel lines are cut by a transversal, the alternate-exterior angles are equal.*

97. *Theorem 16. If two lines are cut by a transversal, making the alternate-interior angles equal, the lines are parallel.*



Given. Lines m and n cut by transversal l making ∠ 3 = ∠ 6.
To be proved. m ∥ n.
Proof. Through A draw a line parallel to n. This line must coincide with m.
For ∠ CAB = ∠ 6 Theo. 15.
And ∠ 3 = ∠ 6 Given.
∴ ∠ CAB = ∠ 3 Ax. 8.
∴ CD and m must coincide. Def.
(Equal angles are congruent.)
But CD is ∥ to n. Const.
∴ m, coinciding with CD, is ∥ to n. q. e. d. Post. 7.

This theorem and the corollaries which follow are the converse of the preceding theorem and its corollaries.

98. *Corol. 1. If two lines are cut by a transversal, making the corresponding angles equal, the lines are parallel.*

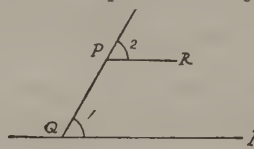
99. *Corol. 2 If two lines are cut by a transversal, making the two interior (exterior) angles on the same side of the transversal supplementary, they are parallel.*

100. *Corol. 3. If two lines are cut by a transversal, making the alternate-exterior angles equal, the lines are parallel.*

EXERCISE.

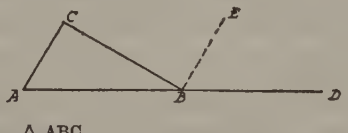
Write out proof of the corollaries stated under theorems 15 and 16.

101. *Problem 7. Through a given external point, to draw a line parallel to a given line.*



Given. Point P not on line l.
Required. To construct a line through P, ∥ to l.
Construction. Draw any line m through P cutting l in the point Q.
At P construct ∠ 2 = ∠ 1, drawing the line PR.
PR is the required line.
Proof to be supplied by pupil.
What other angles might have been constructed at P?
Would it have helped to have drawn the line through P ⊥ to l?

102. *Theorem 17. The sum of the angles of a triangle is equal to two right angles.*



Given. △ ABC.
To be proved. ∠ A + ∠ B + ∠ C = 2 rt ∠s.
Proof. Extend the base AB to D and draw BE ∥ to AC.
At B we have
∠ ABC = ∠ B
∠ DBE = ∠ A Par. 94.
∠ CBE = ∠ C. Par. 93.
Adding ∠ ABC + ∠ DBE + ∠ CBE = ∠ A + ∠ B + ∠ C
= 2 rt ∠s, q. e. d.
since ABD is a straight angle.

103. Def. The *exterior angle* of a rectilinear figure is the angle between one side and an adjacent side produced.

Corol. 1. The exterior angle of a triangle is equal to the sum of the two opposite interior angles.

In the above figure, ∠ DBC is an exterior angle.

104. *Corol. 2. The exterior angle of a triangle is greater than either of the two opposite interior angles.*

105. *Corol. 3. A triangle can have but one right or one obtuse angle.*

It follows, that the other angles of a right triangle are acute angles. See par. 84.

106. *Corol. 4. If two triangles have two angles of one equal to two angles of the other, their third angles are equal.*

EXERCISE. 1. Prove theorem 17 by drawing a line through the vertex parallel to the base.

2. Two triangles are congruent if a side and two angles of one are equal respectively to a side and two corresponding angles of the other.

107. *Theorem 18. If the sides of one angle are parallel respectively to the sides of another, the angles are equal or supplementary.*

Produce two of the non-parallel sides till they meet. The figure will indicate the proof, the angle formed at the intersection of these lines being equal to one of the angles and equal or supplementary to the other. Distinguish between the cases.

A similar theorem may be stated and proved if the sides of the angles are perpendicular

QUADRILATERALS.

108. Def. A rectilinear figure having four sides is called a *quadrilateral.* If two of the sides are parallel, the figure is a *trapezoid.* If the opposite sides are parallel, the figure is a *parallelogram.* Symbol □.

109. Def. If the adjacent sides of a parallelogram are equal, the figure is a *rhombus.* It can be shown that all the sides of a rhombus are equal.

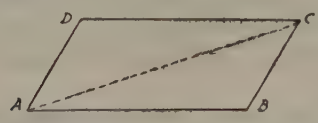
110. Def. If one angle of a parallelogram is a right angle, the figure is a *rectangle.* It will appear that all the angles of a rectangle are right angles.

111. Def. If the adjacent sides of a parallelogram are equal and one angle of the parallelogram is a right angle, the figure is a *square.* It follows from the above, that a square may be thought of as a rhombus or as a rectangle. All its sides are equal and all its angles are right angles. See Exercises following par. 120.

112. Def. The side on which the figure seems to rest is called the *base.* In case the side opposite the base is parallel to it, it is called the *upper base.* The perpendicular distance between the bases in this case is called the *altitude.* In the case of a triangle, the perpendicular distance from the vertex to the base is called the *altitude* of the triangle.

The *diagonal* of any rectilinear figure is the segment joining any two vertices which do not lie on a common side.

113. *Theorem 19. The opposite sides of a parallelogram are equal.*



Given. ABCD a □.
To be proved. AB = CD and AD = BC.
Proof. Draw the diagonal AC.
In △ ABC and ACD,

	AC = AC	Common.
	∠ BAC = ∠ ACD	
and	∠ ACB = ∠ CAD	Theo. 15.
	∴ △ ABC ≅ △ ACD.	Theo. 3.
	∴ AB = CD and AD = BC, q. e. d.	Par. 30.

114. *Corol. 1. The opposite angles of a parallelogram are equal.*

This follows from the above or it may be proved immediately from Theorem 18.

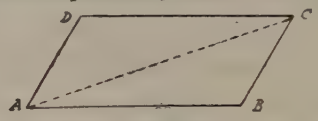
115. *Corol. 2. A diagonal bisects a parallelogram into two congruent triangles.*

116. *Corol. 3. Segments of parallel lines cut off by parallel lines are equal.*

117. *Corol. 4. Two parallel lines are everywhere equally distant.*

The distance is measured along the perpendiculars dropped from points on one line to the other. What is true of perpendiculars to the same line?

118. *Theorem 20. (Converse of Theo. 19.) If the opposite sides of a quadrilateral are equal, the figure is a parallelogram.*

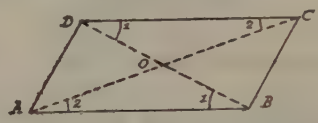


Suggestion. Draw the diagonal AC, and prove the △ ABC and ACD congruent by Theorem 6. Then ∠ ACB = ∠ CAD and AB is ∥ to CD. Similarly, AD ∥ BC.

119. *Theorem 21. If two sides of a quadrilateral are equal and parallel, the figure is a parallelogram.*

Use the same figure as above.
Show △ ABC and ACD congruent by Theorem 2, and proceed as in the preceding theorems.

120. *Theorem 22. The diagonals of a parallelogram bisect each other.*



Given. □ ABCD, with diagonals AC and BD meeting at O.
To be proved. AO = OC and BO = OD.
Proof. In △ ABO and CDO, we have

	AB = CD	Theo. 19.
	∠ ABO = ∠ CDO	
and	∠ BAO = ∠ DCO.	Theo. 15.
	∴ △ ABO ≅ △ CDO.	Theo.
	∴ AO = OC	
and	BO = OD. q. e. d.	Par. 30.

EXERCISES.

Prove the following true statements.

1. The angles of a rectangle are all right angles.

2. All the sides of a square are equal and all its angles are right angles.

3. If the diagonals of a quadrilateral bisect each other, the figure is a parallelogram.

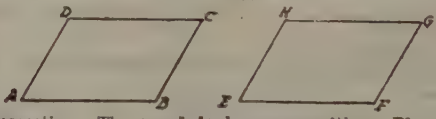
4. The diagonals of a rhombus bisect each other at right angles.

5. The diagonals of a rectangle are equal.

6. If one angle of a parallelogram is given, the others are determined.

7. If the diagonals of a quadrilateral bisect each other and are equal, the figure is a rectangle.

121. *Theorem 23. Two parallelograms are congruent if an angle and the two adjacent sides of one are equal respectively to an angle and the two adjacent sides of the other.*

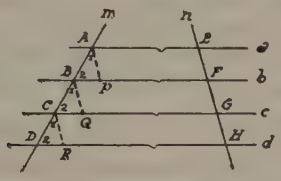


Suggestion. The proof is by superposition. Place □ EFGH on □ ABCD so that the equal angles and corresponding sides of the two figures coincide. The opposite sides will coincide by Post 7.

122. *Corol. Two rectangles are congruent if two adjacent sides of one are equal respectively to two adjacent sides of the other.*

EXERCISE. When are squares equal?

123. *Theorem 24. If three or more parallels cut off equal segments on one tranversal, they cut off equal segments on every transversal.*



Given. ∥s a, b, c, and d cut by transversal m at the points A, B, C and D, AB = BC = CD, and transversal n cutting the ∥s at E, F, G and H.

To be proved. EF = FG = GH.

Proof. Through A, B, and C draw lines ∥ to n, cutting the parallels at P, Q and R as in the figure.

Then AP, BQ, and CR are ∥. Par. 90.

The angles marked 1 are equal. Par. 94.

Similarly, the angles marked 2 are equal.

also AB = BC = CD. Given.

∴ △ ABP ≅ BCQ ≅ △ CDR. Par. 66.

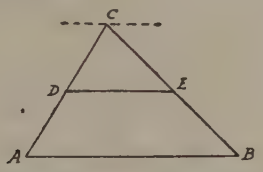
∴ AP = BQ = CR.

But AP = EF, BQ = FG, CR = GH. Par. 116.

(Segments of parallel lines cut off by parallel lines are equal.)

∴ EF = FG = GH. q. e. d. Par. 18.

124. *Corol. A line through the mid-point of one side of a triangle parallel to the base, bisects the other side.*



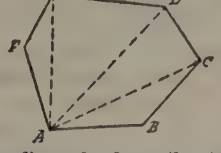
Draw a line through the vertex parallel to the base. This gives three parallel lines and we can apply the theorem.

POLYGONS.

125. Def. A rectilinear figure of more than four sides is called a *polygon.* This term is also used to include triangles and quadrilaterals. Special terms are used to designate polygons having a certain number of sides. A *pentagon* is a five sided figure. A *hexagon* is a six sided figure. Other names used are heptagon, octagon, decagon, duodecagon, etc.

The sum of the lengths of the sides of a polygon is called the *perimeter.*

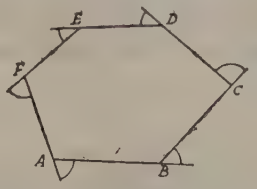
126. *Theorem 25. The sum of the interior angles of a polygon is equal to the number of sides less two times two right angles.*



Draw all the diagonals from the point A. Notice that the number of triangles formed in this manner will always be equal to the number of the sides less two, the two adjacent to A. The sum of the angles of these triangles is equal to the sum of the interior angles of the polygon. But the sum of the angles of a triangle is equal to two right angles. The theorem follows.

Write out complete proof.

127. *Theorem 26. The sum of the exterior angles of a polygon, made by producing each side in succession, is equal to four right angles.*



The sum of the interior and exterior angle at each vertex is equal to 2 rt ∠. The sum of the interior angles is (n − 2) × 2 rt ∠ = n × 2 rt ∠ − 4 rt ∠. Since there are n vertices, the first part of this expression represents the sum of the interior and exterior angles. Therefore, the last part must be the sum of the exterior angles, i. e., 4 rt. ∠.

LOCI.

128. Def. *The locus of a point, or locus of points,* is the path traced by a point moving under certain geometric conditions. It includes (1) all points that satisfy the given conditions, and (2) no other points.

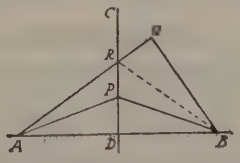
For example, the circle can be defined as the locus of points equally distant from a fixed point.

The locus of points equally distant from two parallel lines is a line parallel to and mid-way between them.

The locus of points one inch from a given line is composed of two lines, one on each side of the given line, parallel to it at a distance of one inch.

129. To prove that a straight or curved line is the locus defined by a given set of conditions two things are necessary. (1) Proof that every point on the line or lines satisfies the given conditions. (2) Proof that any point not on the line or lines does not satisfy the conditions.

130. *Theorem 27. The locus of points equally distant from the ends of a segment is the perpendicular-bisector of the segment.*



Given. CD the perpendicular-bisector of AB.

To be proved. CD is the required locus.

Proof. (1) Every point on CD satisfies the conditions.

Let P be any point on CD, and draw AP and BP.

In rt. △ PAD and PBD,

AD = BD Const.

and PD = PD Common.

∴ △ PAD ≅ △ PBD. Par. 64.

∴ PA = PB. q. e. d. ?

and any point P on CD is equally distant from A and B.

(2). Any point Q not on CD is not equally distant from A and B.

Draw QA and QB and let QA intersect CD at R.

Draw RB.

Then BQ < BR + RQ Post. 3.

(A segment is the shortest distance between two points.)

But AR = BR (1) above.

and BQ < AR + RQ. Ax. 8.

∴ BQ < AQ

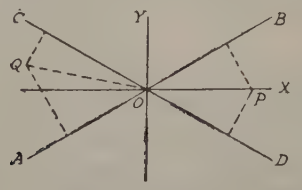
and any point Q not on CD is unequally distant from A and B.

∴ CD is the required locus. q. e. d.

EXERCISE. The locus of a point equally distant from the vertices of a triangle is the intersection of the perpendicular-bisectors of the sides.

131. Def. When three or more lines pass through the same point, as in the above exercise, they are said to be *concurrent.*

132. *Theorem 27. The locus of points equally distant from two intersecting lines is the pair of bisectors of the angles formed by the given lines.*



Given. AB and CD intersecting at O and OX and OY bisectors of the angles so formed.

To be proved. OX and OY is the required locus.

Proof. (1) Take P any point on the assumed locus and drop ⊥s on the given lines. The rt △ so formed are congruent, and, therefore, the perpendiculars are equal.

(2). Take any point Q not on the bisectors and drop ⊥s to the given lines. Show that these ⊥s are unequal by showing that if they are equal then Q will have to lie on the bisectors.

EXERCISES.

1. The perpendicular-bisectors of the sides of a triangle are concurrent.
2. The bisectors of the angles of a triangle are concurrent.

Def. The line segment drawn from a vertex of a triangle to the middle point of the opposite side is called a *median.*

3. The medians of a triangle are concurrent in a point two thirds of the distance from the vertex to the base.
4. The altitudes of a triangle are concurrent.

133. Many interesting and valuable theorems concerning the properties of rectilinear figures can be developed from the preceding work. The student should notice all theorems that prove lines or angles equal or figures congruent. It is helpful to write out a list of all theorems that might be valuable in solving particular types of propositions. The statement of what is "to be proved" indicates the group of theorems in which the "reasons" of the proof are most likely to be found.

INEQUALITIES.

134. Many times it is necessary to prove certain magnitudes greater or less than others. This calls for a group of theorems which are stated here for reference. They are not necessary in the further development of geometry, but they are useful many times in the applications of the science.

EXERCISES.

1. If one angle of a triangle is greater than a second, the side opposite the greater angle is the greater side.
2. Converse of 1. If one side of a triangle is greater than a second, the angle opposite the greater side is the greater angle.
3. If two lines drawn from a point in a perpendicular cut off unequal distances from the foot of the perpendicular, they are unequal and the more remote is the greater.
4. Two lines drawn from a point to the extremities of a segment are greater than the lines from any point within the triangle so formed.
5. The sum of any two sides of a triangle is greater than the third side, and the difference is less than the third side.

CIRCLES.

135. A circle was defined in Par. 26. The terms center, radius and circumference were also explained. Symbol is ⊙.

136. Def. A *chord* of a circle is any segment whose end points lie on the circumference of the circle.

137. Def. A *diameter* is a chord which passes through the center of the circle.

It follows at once that *all diameters of the same circle or of equal circles are equal.*

The diameter equals twice the radius.

138. Def. A part of the circumference is called an *arc.*

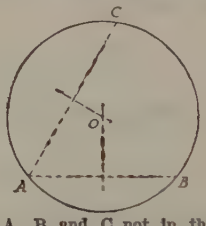
Half of the circumference is called a *semi-circumference.*

An arc less than a semi-circumference is called a *minor arc.* One greater than a semi-circumference is called a *major arc.* Unless otherwise stated, the word arc will mean minor arc.

139. Def. An angle whose vertex is at the center of the circle is called a *central angle.* It is said to *intercept* the arc between its sides while the arc is said to *subtend* the central angle. The chord joining the end points of the arc is said to *subtend* the arc.

140. Def. An angle whose vertex is on the circumference and whose sides are chords is called an *inscribed angle.*

141. *Problem 8. To draw a circle which will pass through three given points not in the same straight line.*



Given. Points A, B and C not in the same straight line.

Required. To draw a circle through A, B and C.

Construction. Construct the perpendicular-bisector of the segments AB and AC. Let these ⊥s meet at O.

With O as center and OA as radius, draw the required circle.

Proof. OA = OB.

and OB = OC. Par. 130.

(O lies on the ⊥ bisector of each segment.)

∴ OA = OB = OC. q. e. d.

Def. A circle is said to be *circumscribed* about a polygon when all the vertices of the polygon lie on the circumference of the circle.

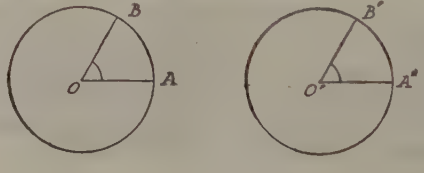
142. *Corol. 1. A circle can be circumscribed about a triangle.*

143. *Corol. 2. Through three points not in the same straight line, one and only one circle can be drawn.*

It is only necessary to show that any other point than O is not equally distant from A, B and C.

See Exercise 3 following Par. 134.

144. *Theorem 28. In the same circle or in equal circles, equal central angles intercept equal arcs on the circumference.*



Note: It will be sufficient to consider the case of equal circles.

Given. Equal ⓢ O and O′ and ∠ AOB = ∠ A′O′B′.

To be proved. Arc AB = Arc A′B′.

Proof. Place ⊙ O′ on ⊙ O so that O′ will fall on O and O′A′ will fall on OA.

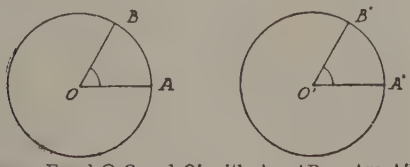
Then O′B′ will fall along OB since ∠AOB = ∠ A′O′B′ and B′ will fall on B, since OB = O′B′.

(Radii of equal circles are equal.)

∴ Arc A′B′ will coincide with AB. q. e. d.

(Equal circles are congruent.)

145. *Theorem 29. In the same circle or in equal circles, equal arcs subtend equal central angles.*

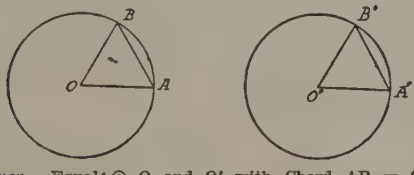


Given. Equal ⓢ O and O′ with Arc AB = Arc A′B′.

To be proved. ∠ AOB = ∠ A′O′B′.

Proof. Place ⊙ O on ⊙ O′ so that the centers coincide and rotate them till the equal arcs coincide. Then the central angles will also coincide.

146. *Theorem 30. In the same circle or in equal circles, equal arcs are subtended by equal chords.*



Given. Equal ⓢ O and O′ with Chord AB = Chord A′B′.

To be proved. Arc AB = Arc A′B′.

Proof. The proof follows by superposition; or the theorem may be proved as follows. Draw radii to the ends of the equal chords. The triangles so formed are congruent by theorem 6. The central angles are therefore equal and the theorem follows by Par. 144.

147. *Theorem 31. In the same circle or in equal circles, equal chords subtend equal arcs.*

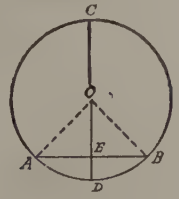
This is the converse of Theorem 30 and the proof follows in a similar manner. Prove △ congruent by Theorem 2.

EXERCISE. Using the exercises under Par. 134, prove the following statements about unequal angles, arcs and chords.

1. In the same circle or in equal circles, unequal central angles intercept unequal arcs, the greater angle intercepting the greater arc, and conversely.

2. In the same circles or in equal circles, unequal chords subtend unequal arcs, the greater chord subtending the greater arc, and conversely.

148. *Theorem 32. A line through the center of a circle, perpendicular to a chord, bisects the chord and its subtended arcs.*



Given. Line CD ⊥ to chord AB of ⊙ O at E.

To be proved. AE = EB, arc AD = arc DB, and arc AC = arc BC.

Proof. Draw radii OA and OB forming rt. △ OAE and OBE.

Show these triangles congruent. Par. 86.

∴ AE = EB q. e. d.

and ∠ AOD = ∠ BOD. ?

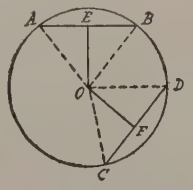
∴ arc AD = arc BD. q. e. d. Par. 144.

Also arc AC = arc BC. q. e. d. ?

149. *Corol. 1. A diameter bisects the circumference.*

150. *Corol. 2. The perpendicular bisector of a chord passes through the center of the circle and bisects the arcs subtended by the chord.*

151. *Theorem 33. In the same circle or in equal circles, equal chords are equi-distant from the center; and, conversely, chords equi-distant from the center are equal.*



Given. Chord AB = chord CD in ⊙ O.

To be proved. OE = OF.

Proof. OE and OF are drawn ⊥ to AB and CD respectively. Draw radii OA and OC. Show the rt. △ OEA and OFC congruent. Then AE = CF. Also, OE and OF bisect AB and CD by the preceding theorem.

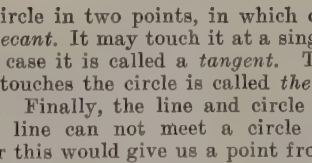
To prove the converse part of the theorem a separate statement of the "Given" data must be made. Use the same figure.

152. *Corol. 1. In the same circle or in equal circles, unequal chords are unequally distant from the center, the more remote being the smaller; and conversely.*

EXERCISE. State and prove the converse of Par. 152.

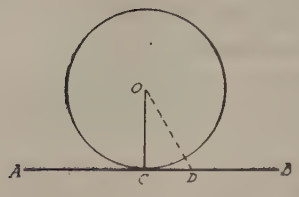
153. *Corol. 2. The greatest chord that can be drawn in a circle is a diameter.*

154. When we consider a line and a circle, we find three conditions possible. The line may



cut the circle in two points, in which case it is called a *secant.* It may touch it at a single point, in which case it is called a *tangent.* The point where it touches the circle is called *the point of tangency.* Finally, the line and circle may not meet. A line can not meet a circle in three points for this would give us a point from which three equal lines would be drawn to a line which is impossible.

155. *Theorem 34. A line perpendicular to a radius at its extremity on the circumference is tangent to the circle.*



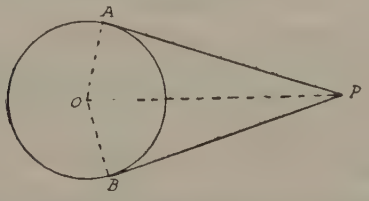
Given. AB ⊥ OC, a radius of ⊙ O, at C.
To be proved. AB is tangent to ⊙ O.
Proof. Draw OD from O to any point of AB except C.
Then OD > OC. Par. 81.
∴ D does not lie on the ⊙.
∴ Only one point of AB is on the ⊙. Hence, by definition, AB is tangent to ⊙. q. e. d.

156. *Corol. 1. A tangent to a circle is perpendicular to the radius drawn to the point of contact.*

157. *Corol. 2. Only one tangent can be drawn to a circle at a given point.*

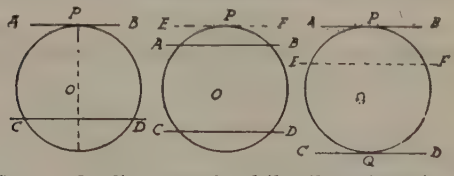
158. *Corol. 3. A line perpendicular to a tangent to a circle at its point of contact, passes through the center of the circle.*

159. *Theorem 35. The tangents to a circle drawn from an external point are equal.*



Given. Lines AP and BP tangent to ⊙ O from point P outside the ⊙.
To be proved. AP = BP.
Proof. Draw the line OP and the radii OA and OB.
Triangles AOP and BOP are rt. △ which have their hypothenuse a common line and corresponding legs equal. Therefore, they are congruent and the other legs are equal.

160. *Theorem 36. Two parallel lines intercept equal arcs on a circumference.*



Case 1. One line a secant and the other a tangent.
Given. AB tangent to ⊙ O at P and secant CD ∥ AB.
To be proved. Arc CP = Arc DP.
Proof. Draw radius OP.
OP ⊥ to AB and therefore to CD. ?
∴ OP bisects the arc CPD. Par. 148.
∴ Arc CP = Arc DP.
Case 2. The lines both secants.
Given. ∥s AB and CD, secants of ⊙ O.
To be proved. Arc AC = Arc BD.
Proof. Draw EF ∥ to AB and CD, tangent to ⊙ O at P.
(Note. The point P is found by drawing the ⊥ from O to AB cutting the ⊙ at P. At P erect a ⊥ to OP. This is the required tangent.)
Then by case 1,
Arc CP = Arc DP,
and Arc AP = Arc BP.
∴ Arc AC = Arc BD. Ax. 3.
Case 3. The lines both tangents.
Suggestion. Draw a secant parallel to the tangents and use case 1.

161. Def. The line joining the centers of two circles is called the *line of centers.*

162. Def. A line tangent to each of two circles is called a *common tangent.* Common tangents that do not cross the line of centers are called *external tangents.* Those which cross the line of centers are called *internal tangents.* By drawing circles, the following cases will be noted.

1. No points in common. One circle may lie entirely inside the other in which case there are no common tangents. One circle may lie entirely outside the other, in which case there are four common tangents, two internal and two external.

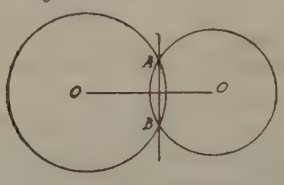
2. One point in common. They are both tangent to the same line at this point and also tangent to each other. If they lie on the same side of the tangent, they are said to be tangent internally, in which case they have no other common tangents. If they lie on opposite sides of this tangent, they are said to be tangent externally, in which case they have two common external tangents and the one internal tangent.

3. Two points in common. These points are called *the points of intersection.* The segment connecting them is the *common chord* of the two circles. In this case, the circles have two common external tangents but no common internal ones.

Two circles cannot intersect in more than two points or they would coincide by Par. 143.

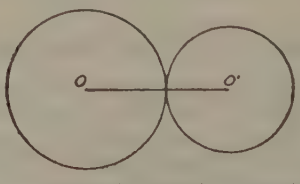
EXERCISE. Draw all cases discussed in Par. 161.

163. *Theorem 37. The line of centers is the perpendicular-bisector of the common chord of two intersecting circles.*



Suggestion. The centers are each equally distant from the end points of the common chord. Use Par. 74.

164. *Theorem 38. The line of centers passes through the point of tangency of two tangent circles.*



Suggestion. The line of centers is the shortest distance between the centers and is equal to the sum of the distances from the centers to the point of contact.

MEASUREMENT OF ANGLES.

165. Def. The *measure* of a magnitude is the number of times it contains another magnitude of the same kind which has been agreed upon as the unit of measure.

This unit is arbitrary and may be taken at pleasure. To avoid confusion and to insure fair measure most countries have passed laws making certain magnitudes the unit of measure for all other magnitudes of the same kind; as the foot, the pound, the gallon, etc. The official units for the United States are kept in Washington, D. C.,

but very accurate copies of each are to be found in the various states and cities.

166. Def. The *ratio* between two magnitudes is the quotient of their numerical measures. If the quotient is an integer or a rational fraction, the magnitudes are said to be *commensurable*. If not, the magnitudes are said to be *incommensurable*. Incommensurable magnitudes exist but for all practical purposes they can be replaced by commensurable magnitudes. It is only with the latter that we will concern ourselves at present.

It should be noted that the measure of a magnitude is the ratio it bears to the unit of measure.

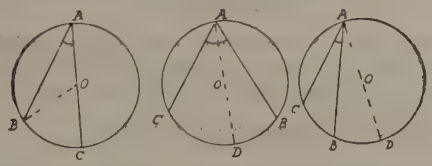
167. Def. In order to establish a connection between central angles and their intercepted arcs, the unit of measure for the arc is chosen as follows. A circumference equals 360 *degrees of arc*. Symbol °. A semi-circumference equals 180°, a quadrant or fourth part of a circumference equals 90°. Each degree of arc is divided into sixty equal parts called *minutes of arc*. Symbol ′. Each minute is divided into sixty equal parts called *seconds of arc*. Symbol ″.

By comparing the above with Par. 50, we are led to accept the following theorem without additional proof.

168. *Theorem 39. In the same circle or in equal circles, central angles have the same ratio to each other as their intercepted arcs.*

169. *Corol. A central angle is measured by its intercepted arc,* i. e., the number of degrees, minutes and seconds in a central angle equals the number of degrees, minutes and seconds of arc in the intercepted arc.

170. *Theorem 40. An inscribed angle is measured by one half its intercepted arc.*



Case 1. The center on one side of the angle.
Given. ∠ BAC inscribed in ⊙ O, side AC passing through O.
To be proved. ∠ BAC is measured by ½ arc BC.
Proof. Draw OB. △ AOB is isosceles.
∴ ∠ A = ∠ B
Also ∠ BOC = ∠ A + ∠ C Par. 103, Cor. 1.
= 2 × ∠ BAC
Or ∠ BAC = ½ ∠ BOC.
But BOC is measured by arc BC.
∴ BAC is measured by ½ arc BC. q. e. d.
Case 2. The center within the angle.
Draw the diameter AD. Apply case 1 to both of the inscribed angles so formed. Then add.
Case 3. The center outside the angle.
The proof is similar to that suggested in case 2.

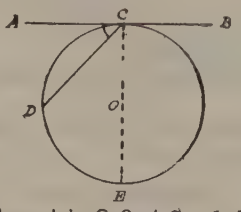
171. Def. A *segment* of a circle is the portion of the plane bounded by a chord and its subtended arc. When the chord is a diameter, the segment is a *semi-circle*.

172. Def. A *sector* of a circle is the portion of the plane bounded by two radii and their intercepted arc. When the radii are perpendicular, the sector is a *quadrant* or the fourth part of a circle.

173. Def. An angle is said to be *inscribed in* a segment when its vertex lies on the arc and the sides of the angle pass through the end points of the arc of the segment.

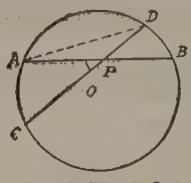
174. *Corol. An angle inscribed in a semicircle is a right angle.*

175. *Theorem 40. The angle formed by a tangent to a circle and a chord drawn from the point of contact is measured by one half the intercepted arc.*



Given. AB tangent to ⊙ O at C and chord CD.
To be proved. ∠ACD is measured by ½ arc CD.
Proof. Draw diameter COE. This will be ⊥ to AB. ?
∴ ∠ ACE = 90° and is measured by ½ arc CDE. ?
Also ∠ DCE is measured by ½ arc DE. ?
∴ ∠ ACD is measured by ½ arc CD. q. e. d. Ax. 8.

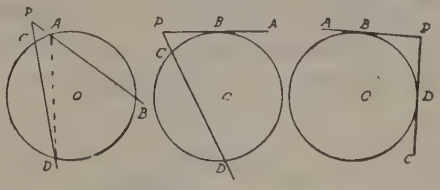
176. *Theorem 41. The angle formed by two chords intersecting within a circle, is measured by half the sum of the intercepted arcs.*



Given. Chords AB and CD of ⊙ intersecting at P.
To be proved. ∠ APC is measured by ½ (arc AC + arc BD).

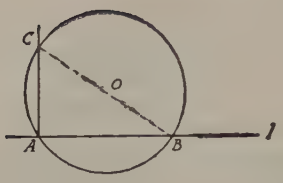
Proof. Draw the line AD. The required angle is the sum of the two inscribed angles formed at A and D and is therefore measured by one half the sum of their intercepted arcs.

177. *Theorem 42. If two secants, a secant and a tangent, or two tangents to a circle meet outside the circle, the angle so formed is measured by one half the difference of the intercepted arcs.*



Case 1. Two secants.
Given. Secants AB and CD meeting at P.
To be proved. ∠ P is measured by ½ (arc BD — arc AC).
Proof. Draw AD.
∠ BAD = ∠ D + ∠ P. Par. 103, Cor. 1.
∴ ∠ P = ∠ BAD — ∠ D.
But ∠ BAD is measured by ½ arc BD and ∠ D is measured by ½ arc AC. Par. 170.
∴ P is measured by ½ (arc BD — arc AC). q. e. d.
The proof of other two cases is left to reader.

178. *Problem 9. To erect a perpendicular to a line at a given point.*



Given. Point A on line l.

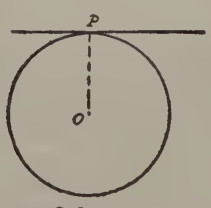
Required. To erect a ⊥ at A.

Construction. With any convenient point O as center and OA as radius draw a ⊙ cutting l at B. Draw the diameter BOC. Draw the line AC.

AC is the required line.

Proof. ∠ CAB is a rt. ∠ being inscribed in a semicircle. Par. 174.

179. *Problem 10. To draw a tangent to a circle at a given point.*

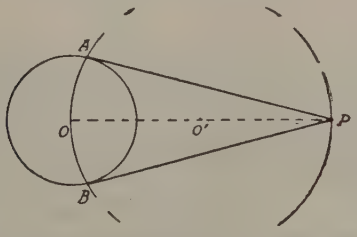


Given. Point P on ⊙ O.

Required. To draw the tangent at P.

Construction. The solution is suggested in the proof of Theorem 34, Par. 155.

180. *Problem 11. To draw a tangent to a circle from a given external point.*



Given. Point P outside ⊙ O.

Required. To draw a tangent to the ⊙ through P.

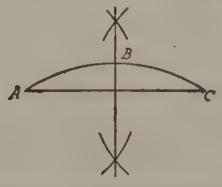
Construction. With OP as diameter, draw a circle intersecting the given circle at A and B. Draw PA and PB. Either is the required tangent.

Proof. ∠ PAO = ∠ PBO = a rt. ∠. Par. 174.

∴ PA and PB are ⊥ to the radii OA and OB respectively.

∴ PA and PB are tangent to ⊙ O. q. e. d. Par. 155.

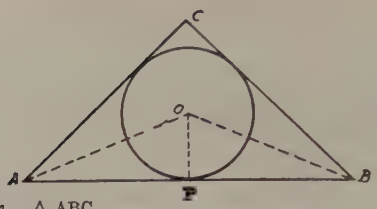
181. *Problem 12. To bisect a given arc.*



Suggestion. Bisect its subtending chord, or its central angle.

182. **Def.** A circle is said to be *inscribed in* a polygon when it is tangent to all the sides of the polygon.

183. *Problem 13. To inscribe a circle in a triangle.*



Given. △ ABC.

Required. To inscribe a ⊙ in △ ABC.

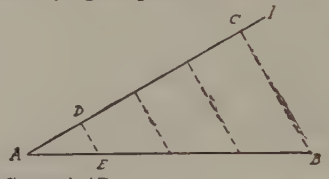
Construction. Draw the bisectors of ∠ A and B, meeting in the point O.

Draw the ⊥ OP from O to the side AB.

With OP as radius draw the required circle.

Proof. Show O equally distant from all three sides of the triangle.

184. *Problem 14. To divide a segment into any number of equal parts.*



Given. Segment AB.

Required. To divide it into any number of equal parts.

Construction. On any convenient line l through A and with any convenient length, measure off as many equal parts as are required, as four, letting the end of the last equal segment fall at C.

Draw BC and through the ends of each equal segment on l draw parallels to BC.

These parallels will divide AB into the required number of equal parts. Prove.

EXERCISES.

1. Given two adjacent sides and the included angle, construct the parallelogram.
2. Given a side, construct the square.
3. Given the diagonals, construct the rhombus.
4. Given the hypothenuse, and an acute angle, construct the triangle.

PROPORTION.

185. **Def.** A statement of equality between two ratios is called a *proportion.* The four numbers forming the two ratios are said to be *in proportion.*

Notation. A proportion is written

$$\frac{a}{b} = \frac{c}{d}, \text{ or } a : b = c : d.$$

which is read a is to b as c is to d.

The first and third terms in a proportion are called *antecedents.* The second and fourth terms are called *consequents.*

The first and fourth terms in a proportion are called *extremes.* The second and third are called *means.*

186. **Def.** The *fourth proportional* to three numbers is the number which completes the proportion; $a : b = c : x$.

187. If four numbers are in proportion, they can be grouped together in many ways. Starting with the fractional form, we will use the principles of algebra to derive some of these relations.

188. *Theorem 43. If four numbers are in proportion, either pair may be taken as the means and the other as the extremes.*

Given. $\frac{a}{b}=\frac{c}{d}$. Fundamental relation.

To be proved. $\frac{b}{a}=\frac{d}{c}$.

Proof. Clearing of fractions we get

$$bc = ad. \quad (1)$$

Dividing both sides by ac gives

$$\frac{bc}{ac}=\frac{ad}{ac},$$

or, $$\frac{b}{a}=\frac{d}{c}.$$ q. e. d. (2).

189. In a brief form, the more important laws of proportion are stated below with proofs indicated in all cases.

If four numbers are in proportion, they are in proportion

1. By Alternation; ie., $$\frac{a}{c}=\frac{b}{d}. \quad (3)$$

In relation 1 above divide by cd.

2. By Inversion; ie., $$\frac{b}{a}=\frac{d}{c}. \quad (4)$$

In relation 1 divide by ac.

3. By Composition; ie., $$\frac{a+b}{b}=\frac{c+d}{d}. \quad (5)$$

For $\frac{a}{b}+1=\frac{c}{d}+1$, and clearing of fractions gives the required equation.

4. By Division; ie., $$\frac{a-b}{b}=\frac{c-d}{d}. \quad (6)$$

Subtract 1 from each side of the Fund. Rel. and clear of fractions on each side of the equality.

5. By Composition and Division; ie.,

$$\frac{a+b}{a-b}=\frac{c+d}{c-d}. \quad (7)$$

Divide (5) by (6).

190. Def. In a series of equal ratios, if the consequent of each ratio is the antecedent of the one following, the numbers are said to be in *continued proportion.*

If three numbers are in continued proportion, the common term is called the *mean proportional* between the other two. The last term is called the *third proportional.*

191. *Theorem 44. The mean proportional between two numbers is the square root of their product.*

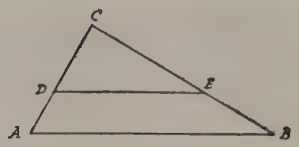
Given. $\frac{a}{b}=\frac{b}{c}$

Then, $ac = bb = b^2$ Par. 188, (1).

$\therefore \quad b=\sqrt{ac}.$ q. e. d.

192. In proportion, it is customary to speak of the ratio between the magnitudes, when the ratio between the numbers which measure these magnitudes is meant.

193. *Theorem 45. A line parallel to one side of a triangle intersecting the other two sides, divides those sides proportionally.*



Given. $\triangle$ ABC and DE $\parallel$ to AB.

To be proved. AD : DC = BE : EC.

Proof. Consider only the commensurable case where AD and DC have a common unit of measure.

Let this common unit of measure be contained 3 times in AD and 4 times in DC.

Then $\frac{AD}{DC}=\frac{3}{4}$.

Through the points of division of AC draw $\parallel$s to AB. These lines do not appear in the figure.

These lines will divide BE into 3 and EC into 4 equal parts. Par. 123.

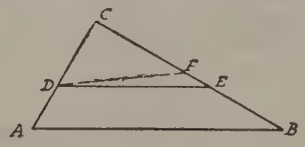
$\therefore \quad \frac{BE}{EC}=\frac{3}{4}$.

$\therefore \quad \frac{AD}{DC}=\frac{BE}{EC}$. q. e. d. ?

194. *Corol. A line parallel to one side of a triangle, intersecting the other two sides, divides these sides in such a way that one side is to either of its segments as the other side is to its corresponding segment.*

This may be proved directly or by using the law of composition on the above proportion. The corollary states $\frac{AC}{AD}=\frac{BC}{BE}$ and $\frac{AC}{DC}=\frac{BC}{EC}$.

195. *Theorem 46. (Converse of Theorem 45) A line which divides two sides of a triangle proportionally is parallel to the third side.*



Given. $\triangle$ ABC and line DE cutting AC and BC so that $\frac{AD}{AC}=\frac{BE}{BC}$.

To be proved. DE $\parallel$ AB.

Proof. Draw a line through D parallel to AB, cutting BC at F. It is sufficient to show that F must coincide with E.

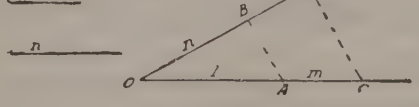
Since $\frac{AD}{AC}=\frac{BE}{BC}$,

and by const. $\frac{AD}{AC}=\frac{BF}{BC}$, Par. 194.

$\therefore$ F and E must coincide. q. e. d. Why?

NOTE.—Any proportion in pars. 193 and 194 may be taken when it is given that the two sides of a triangle are divided proportionally.

196. *Problem 15. To construct a fourth proportional to three given line segments.*

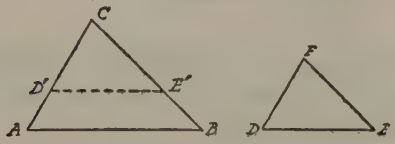


Given. Segments l, m and n.
Required. To construct their fourth proportional.
Construction. Take any two intersecting lines and on one line measure l and m and on the other measure n as in the figure. Draw AB through the end points of l and n. Draw CD through the end point, C, of m parallel to AB, cutting the other line at D. Then BD is the required line, for $\frac{l}{m} = \frac{n}{x}$. Par. 193.

SIMILAR POLYGONS.

197. Two polygons are said to be *similar* if their corresponding angles are equal and their corresponding sides are proportional. By corresponding sides of similar figures is meant the sides between pairs of corresponding equal angles. The ratio between any two corresponding sides or segments is called the *ratio of similitude.*

198. *Theorem 47. Two triangles are similar if their corresponding angles are equal.*



Given, △ ABC and DEF with ∠ A = ∠ D, ∠ B = ∠ E, ∠ C = ∠ F.
To be proved. △ ABC is similar to △ DEF.
Proof. Place △ DEF on △ ABC so that ∠ F will fall on its equal ∠ C, D falling at D' on AC and E at E' on BC.
D'E' is parallel to AB, since ∠ A = ∠ D = CD'E'. Par. 98.

$\therefore \frac{AC}{D'C} = \frac{BC}{E'C}$. Par. 193.

$\therefore \frac{AC}{DF} = \frac{BC}{EF}$.

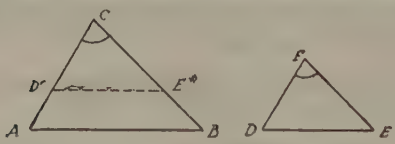
Similarly, $\frac{AC}{DF} = \frac{AB}{DE}$, and the sides are proportional. q. e. d.

199. *Corol. 1. Two triangles are similar if two angles of one equal respectively two angles of the other.*

Their third angles are also equal.

200. *Corol. 2. Two right triangles are similar if an acute angle of one equals an acute angle of the other.*

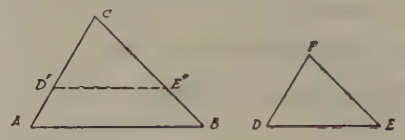
201. *Theorem 48. Two triangles are similar if an angle of one is equal to an angle of the other and the including sides are proportional.*



Write out the proof.
Suggestion. The proof is by superposition, the third side of the superposed triangle being parallel to the corresponding side of the other by Par. 195.

202. *Corol. Two right triangles are similar if the legs of one triangle are proportional to the legs of the other.*

203. *Theorem 49. Two triangles are similar if the sides of one are proportional to the corresponding sides of the other.*



Given. In △ ABC and DEF. $\frac{AB}{DE} = \frac{AC}{DF} = \frac{BC}{EF}$.
To be proved. △ ABC and DEF are similar.
Proof. On CA take CD' = FD and on CB take CE' = FE.
Then △ ABC and CD'E' are similar. Par. 201.

$\therefore \frac{AC}{D'C} = \frac{AB}{D'E'} = \frac{AC}{DF}$.

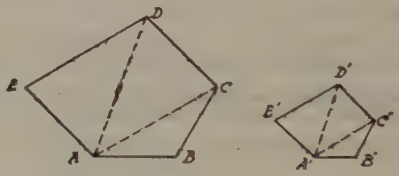
But $\frac{AB}{DE} = \frac{AC}{DF}$. Given.

$\therefore$ DE = D'E',
and △DEF and CD'E' are congruent. ?
$\therefore$ △ ABC and DEF are similar. q. e. d.

204. *Theorem 50. The perimeters of two similar polygons are in the same ratio as any two corresponding sides.*

Apply the law of Composition as many times as the polygon has sides.

205. *Theorem 51. Two polygons are similar if they are composed of the same number of triangles, similar each to each and similarly placed.*



Given. Polygons ABCDE and A'B'C'D'E' with △ ABC similar to △ A'B'C', △ ACD similar to △ A'C'D', and △ ADE similar to △ A'D'E'.
To be proved. ABCDE is similar to A'B'C'D'E'.
Proof. 1. The angles are equal. ∡ B and B' and ∡ E and E' are corresponding angles of similar triangles. ∡ C and C', and ∡ D and D' are equal being the sum of two corresponding angles in similar triangles. ∡ A and A' are equal being the sum of three corresponding angles of similar triangles.

2. The sides are proportional. The polygons are composed of triangles which have at least one side in common. Therefore, the ratio of similitude for one triangle is the same for all the rest and is the ratio of similitude for the polygon. A series of equations which are connected by the ratios of the common sides proves that all sides have a common ratio.

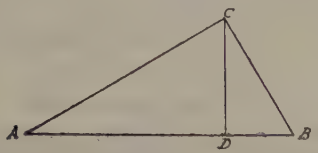
206. *Theorem 52. Two similar polygons can be divided into the same number of similar triangles, similar each to each and similarly placed.*

Suggestion. Take any two similar polygons and draw the diagonals from one vertex. This will divide the polygons into triangles. Starting with the outside triangles, we show them similar by Par. 203. Then take the next triangle. In each case, two sides will be proportional and the included angle can be shown equal.

207. *Theorem 53. If a perpendicular is dropped from the vertex of the right angle to the hypothenuse of a right triangle,*

1. The triangles so formed are similar to the given triangle and to each other,

2. The perpendicular is a mean proportional between the segments of the hypothenuse.



Given. Rt. △ ABC and CD ⊥ to hypothenuse, AB, from C.

To be proved. 1. ▲ ABC, ADC and BDC similar.

2. $DC^2 = AD \times DB$.

Proof. Part 1 follows directly from Par. 200.

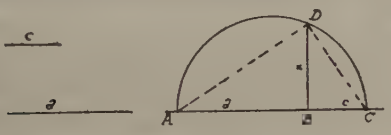
To prove Part 2, consider similar ▲ ADC and BDC.

$AD : DC = DC : DB$ Part 1.

$\therefore DC^2 = AD \times DB$. q. e. d.

208. *Corol. The perpendicular from any point on the circumference to a diameter is a mean proportional between the segments of the diameter.*

209. *Problem 16. To construct a mean proportional to two given segments.*



Given. Segments a and c.

Required. To construct b, a mean proportional between a and c.

Construction. Measure off a and c on a straight line forming ABC. With AC as diameter draw a semi-circumference. At B, erect the perpendicular to AC cutting the circumference at D.

BD is the mean proportional.

Why?

210. Many important relations between the sides of triangles can be established by the use of similar triangles. The methods used are those of algebra and geometry combined. Among these theorems is found a formula for the altitude of any triangle in terms of the three sides. As this will be used later, it is stated here for reference.

Let the sides be a, b, and c,

$$s = \tfrac{1}{2}(a + b + c),$$

and h = the altitude drawn to the side c.

Then

$$h = \frac{2}{c}\sqrt{s(s-a)\ (s-b)\ (s-c)}$$

A similar form holds for the altitudes of the other two sides.

EXERCISES.

1. Two triangles are similar if their sides are parallel each to each or perpendicular each to each.

2. In an oblique triangle, the square of a side opposite an acute (obtuse) angle is equal to the sum of the squares of the other two sides less (plus) twice the product of one of these sides by the projection of the other side upon it.

AREA.

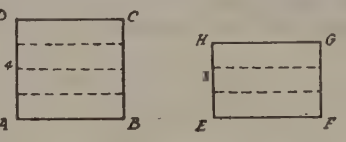
211. Def. The measure of the part of a plane included in a geometrical figure is called the *area of the figure.* It is the ratio the whole figure has to a square, a certain length on each side, which has been agreed upon as the unit of area. The side of the unit of area is usually taken equal to a unit of linear measure as the foot, the inch or the centimeter.

212. Def. Two geometrical figures are said to be *equal* when the measures of the areas included by them are equal in terms of the same unit.

213. *Congruent figures are equal,* but the converse is not necessarily true. See Par. 30.

214. For convenience, the terms triangle, rectangle, parallelogram, circle etc., are often used when the areas of these figures are being considered.

215. *Theorem 54. Two rectangles having equal bases are to each other as their altitudes.*



Consider only the case where the altitudes are commensurable to each other.

Given. Rectangles ABCD and EFGH, bases AB and EF equal.

To be proved. $\dfrac{ABCD}{EFGH} = \dfrac{AD}{EH}$.

Proof. Since the altitudes are commensurable, let the common unit divide AD and EH into m and n equal parts respectively.

Then $\dfrac{AD}{EH} = \dfrac{m}{n}$. Figure.

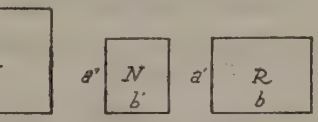
Draw parallels through the points of division dividing the rectangles into m and n equal parts so that

$$\frac{ABCD}{EFGH} = \frac{m}{n}.$$

$$\therefore \frac{ABCD}{EGFH} = \frac{AD}{EH}. \quad \text{q. e. d.}$$

216. *Corol. Two rectangles having equal altitudes are to each other as their bases.*

217. *Theorem 55. Two rectangles are to each other as the products of their bases and altitudes.*



Given. Rectangles M and N with altitudes a and a′ and bases b and b′ respectively.

To be proved. $\dfrac{M}{N} = \dfrac{ab}{a'b'}$.

Proof. Construct a rectangle R with altitude a′ and base b.

Then $\dfrac{M}{R} = \dfrac{a}{a'}$ and $\dfrac{R}{N} = \dfrac{b}{b'}$.

Multiplying the corresponding sides of these two equations gives the required result. q. e. d.

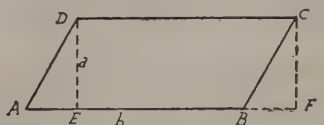
218. *Corol. The area of a rectangle is equal to the product of its base and altitude.*

Suggestion. Take the unit of area as the second rectangle and apply the theorem.

219. This important theorem is used in the upper grades of arithmetic. It is proved there informally by dividing the given rectangle into

squares equal to the unit of area being used, and then counting the squares.

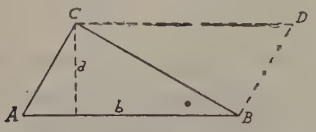
220. *Theorem 56. The area of a parallelogram is equal to the product of its base and altitude.*



Given. □ ABCD, with altitude a and base b.
To be proved. Area ABCD = ab.
Proof. Drop ⊥s CF and DE to the base AB extended. Then rt. △ AED and BFC are equal. Prove this.

∴ Rect. EFCD = □ ABCD
= ab Par. 218.
∴ □ ABCD = ab. q. e. d.

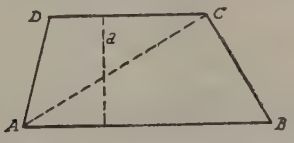
221. *Theorem 57. The area of a triangle is equal to one half the product of its base and altitude.*



Suggestion. The triangle ABC is one half the parallelogram formed by drawing BD and CD parallel to AC and AB respectively. This parallelogram has the same base and altitude as the given triangle.

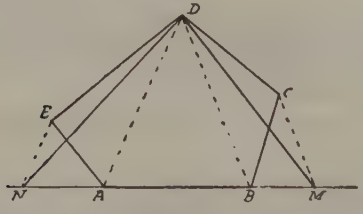
222. *Corol. Two triangles which have the same or equal bases and equal altitudes are equal.*

223. *Theorem 58. The area of a trapezoid is equal to the product of one half the sum of the bases times the altitude.*



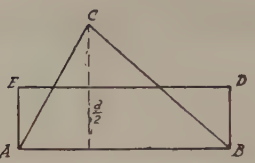
Suggestion. A diagonal will divide the figure into two triangles having equal altitudes and the two bases of the trapezoid as their respective bases.

224. *Problem 16. To construct a triangle equal to a given polygon.*



Given. Polygon ABCDE.
Required. To construct a △ = ABCDE.
Construction. Draw BD and through C draw a line ∥ to BD meeting AB produced at M. Draw DM. Then △ BCD = △ BMD and ABCDE = AMDE. Par. 222.
In the same way, draw △ AND = △ ADE making △ NMD = ABCDE. If the polygon has more than five sides as in the figure continue as indicated.

225. *Problem 17. To construct a rectangle equal to a given triangle.*



Suggestion. On the base of the triangle as the base of the rectangle and with half the altitude of the triangle as the altitude of the rectangle, construct the rectangle.

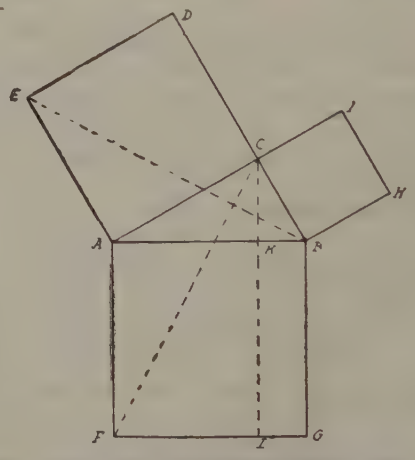
226. *Problem 18. To construct a square equal to a given rectangle.*

Suggestion. For a side of the square use the mean proportional between the base and altitude.

227. Problems 16 to 18 show how to replace any polygon by a square equal to it. One of the famous problems of geometry is known as squaring the circle, where an attempt is made to construct a square equal to a given circle. This is now known to be impossible as it involves the ratio of incommensurable magnitudes; namely, the diameter and circumference of a circle.

228. Among the most used of the theorems of geometry is the one proved in the next section. It is attributed to Pythagoras, a famous philosopher of the 6th century B. C. Many beautiful and interesting proofs of this theorem have been given since his time but none is more used than the one attributed to Euclid. The theorem follows.

229. *Theorem 59. The square on the hypothenuse of a right triangle is equal to the sum of the squares on the two legs.*



Given. Rt. △ ABC, with squares erected on each side.
To be proved. Sq. ABGF = Sq. ACDE + Sq. CBHI.
Proof. Draw CK ⊥ to AB, meeting FG at L.
Draw EB and CF.
Consider △ ACF and ABE. AC = EA, AF = AB and ∠ EAB = ∠ CAF. ∴ the △ are congruent. ?
Now △ EAB = ½ sq. ACDE ?
and △ ACF = ½ Rect. AKLF ?
∴ Sq. ACDE = Rect. AKLF. ?
In a similar manner, drawing AH and CG prove
Sq. CBHI = Rect. LGBK.
Adding these results,
Sq. ABGF = Sq. ACDE + Sq. CBHI.
q. e. d.

230. Other proofs of this important theorem are given in the various treatises on geometry. If the sides opposite the angles are represented by the corresponding small letters, a, b, and c respectively the theorem states

$$a^2 + b^2 = c^2.$$

Also,
$$a^2 = c^2 - b^2.$$

The square on the leg of a right triangle is equal to the square on the hypothenuse minus the square on the other leg.

231. *Area of a triangle in terms of its sides.* In Par. 210 the altitude of a triangle was stated in terms of its sides. Theorem 57 gives the following formula for the area in terms of the sides.

$$\text{Area} = \sqrt{s(s-a)\ (s-b)\ (s-c)}$$

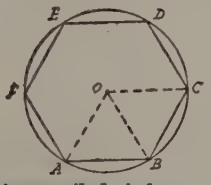
EXERCISES

1. If two triangles have an angle of one equal to an angle of the other, their areas are to each other as the product of the sides including the equal angles.
2. The areas of two similar triangles are to each other as the square of any two homologous sides.
3. The areas of two similar polygons are to each other as the squares of any two homologous sides.

REGULAR POLYGONS AND CIRCLES.

232. Def. A *regular polygon* is a polygon whose sides and angles are equal each to each. We have had examples of regular polygons in the equilateral triangle and the square.

233. *Theorem 60. A circle may be inscribed in or circumscribed about any regular polygon.*



Case 1. The circumscribed circle.
Given. Regular polygon ABCDEF.
To be proved. A circle can be circumscribed about ABCDEF.

Suggestion. Pass a circle through any three consecutive points, as A, B and C, with center at O. See Par. 141. This point O is equally distant from all the other vertices of the polygon. This is shown by proving each triangle formed as in the figure congruent to ABO, remembering that ABO and BCO are isosceles triangles with two sides and two angles equal. Both the angles at B are equal and equal to OCB. Both angles at C are equal. Use Theorem 2.

Case 2. The inscribed circle.
Consider the circumscribed polygon already drawn. The sides of the polygon are equal chords of this circle and, therefore, equally distant from the center O. With this distance as radius, the required circle can be drawn. Write out formal proof.

234. Def. The *center* of a regular polygon is the common center of the inscribed and circumscribed circles.

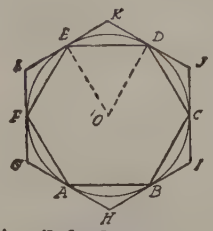
235. Def. The *radius* of a regular polygon is the radius of the circumscribed circle.

236. Def. The *apothem* of a regular polygon is the radius of the inscribed circle.

237. Def. The *central angle* of a regular polygon is the angle at the center between radii drawn to two adjacent vertices.

238. *Corol. In a regular polygon, the central angles are equal.*

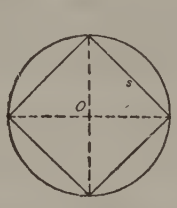
239. *Theorem 61. If a circle is divided into any number of equal arcs, (1), the chords subtending them form a regular inscribed polygon, and (2), the tangents drawn of the ends of the arcs form a regular circumscribed polygon.*



Case 1. The inscribed polygon.
Suggestion. The chords are all equal, since they are subtended by equal arcs. The central angles are all equal being measured by equal arcs. The triangles are congruent isosceles triangles and the angles at the vertices of the polygon are made up of pairs of equal angles and so are equal.

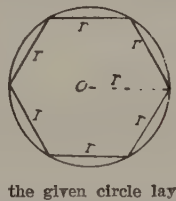
Case 2. The circumscribed polygon.
Suggestion. The triangles formed by the tangents at the end of each arc and the chord of that arc are congruent isosceles triangles. This proves the angles equal and the sides are each double one of the equal sides of the triangles.

240. *Problem 19. To inscribe a square in a circle.*



Suggestion. Draw perpendicular diameters dividing the circle into four equal arcs and connect the end points.

241. *Problem 20. To inscribe a regular hexagon in a circle.*



Suggestion. On the given circle lay off arcs subtended by chords equal to the radius. There will be exactly six such arcs. To prove this, notice that there will be six central angles to the hexagon each equal to 60°. By this construction, equilateral triangles are formed, each angle of which is 60°. There can be six such triangles. Prove.

242. *Problem 20. To inscribe an equilateral triangle in a circle.*

Suggestion. Connect alternate points of the inscribed hexagon.

243. It is obvious that when a polygon of a certain number of sides has been constructed, the number of sides can be doubled by bisecting the subtended arcs of the circumscribed circle.

Methods can be given for constructing polygons of 3, 4, 5, 15, and 17 sides, and hence for polygons of any number of sides which is the product of a power of two and any of these numbers. Many polygons can not be constructed by rule and compasses, as eg., those of 7 and 9 sides. The latter problem calls for the trisec-

tion of an angle, a problem which has claimed the attention of mathematicians for many centuries. These constructions are considered in advanced courses in mathematics.

244. *Theorem 62. Two regular polygons of the same number of sides are similar*

Suggestion. The radii divide them into the same number of triangles similar each to each and similarly placed.

245. The importance of the study of regular polygons lies in the relations which exist between the perimeters and areas of regular polygons and the circumferences and areas of the inscribed and circumscribed circles. If the number of the sides of a polygon is allowed to increase indefinitely, the difference between the perimeter of the polygon and the circumference of the circumscribed circle becomes very small. In the limiting case, they can be shown to be equal. In a similar manner, the area of the polygon approaches the area of the circle, and in the limiting case they are equal to each other.

For this reason, theorems proved for regular polygons, can be stated for circles with only a slight change in wording.

It is also shown that the apothem of the inscribed polygon and the radius of the circumscribed polygon become more and more nearly equal to the radius of the circle and to each other. In the limiting case, they are all equal to each other.

246. *Theorem 63. The perimeters of two regular polygons of the same number of sides are to each other as their radii, or as their apothems.*

How does Par. 204 apply? What about the triangles formed by the radius, apothem and half the side in each polygon?

247. *Corol. The circumference of two circles are to each other as their radii or as their diameters.*

i. e., $\frac{C}{C'} = \frac{r}{r'} = \frac{2r}{2r'} = \frac{d}{d'}$.

248. *Theorem 64. The ratio between the circumference and the diameter is the same for every circle.*

Given. Any two circles O and O'.

To be proved. $\frac{C}{d} = \frac{C'}{d'}$.

Apply the law of alternation to the equation of ratios in Par. 247.

249. The ratio considered in Par. 248 is one of the most important values in mathematics. It can not be found exactly but its value has been determined to any desired degree of accuracy. The value is called *pi*, the Greek letter for p, and is written π. The number commonly used is 3.1416, which is more accurate than most measurements with which it is combined.

250. **The circumference of a circle.** From Theorem 64 and the value of π, we get at once,

$$C = \pi d = 2\pi r.$$

251. *Theorem 65. The area of a regular polygon is equal to one half the product of its perimeter by its apothem.*

Suggestion. Divide the polygon into triangles as in the figure and notice that the area of one triangle is equal to one half the product of one side by the apothem of the polygon. There will be as many triangles as the polygon has sides.

252. *Corol. The area of a circle is equal to one half the product of its circumference by its radius, i. e.,* Area = ½ Cr.

From this it follows directly that the area of a circle equals the product of π by the square of the radius, i.e., Area = πr^2.

253. This does not by any means exhaust the field of plane geometry. Many theorems and problems grow out of those already proved. The examination of loci of points furnishes an interesting study for the earnest student. The idea of symmetry may be developed.

The introduction of a third dimension leads to the study of Solid Geometry where the formulas for the area and volume of solids are derived. The prism, pyramid, cone, cylinder and sphere are considered.

The subject which usually follows geometry is called Trigonometry where, by means of similar right triangles, an accurate method for the measurement of angles in practical problems is developed.

DICTIONARY OF WEIGHTS AND MEASURES.

FOREIGN AND DOMESTIC.

ACRE. A measure of land (Latin, *ager*, a field). Originally as much land as could be plowed in one day. The English statute acre consists of—

6,272,640 square inches.
43,560 square feet.
4,840 square yards.
160 square rods.
10 square chains.

Value of foreign measures compared with the acre—

	English acres.
Scotch acre	equals 1.27
Irish acre	equals 1.62
Austrian joch	equals 1.42
Baden, morgen	equals 0.89
Belgian hectare	equals 2.47
Danish töndeland	equals 1.36
French hectare	equals 2.47
French arpent	equals 0.91
Dutch arpent	equals 2.10
Neapolitan moggia	equals 0.83
Portuguese geira	equals 1.43
Prussian little morgen	equals 0.63
Prussian great morgen	equals 1.40
Russian dessiatine	equals 2.70
Saxon morgen	equals 1.36
Spanish fanegada	equals 1.06
Swedish tunnland	equals 1.22
Swiss faux	equals 1.62
Swiss arpent	equals 1.27
Tuscan saccata	equals 1.22
United States, English acre	equals 1.00
Württemberg, morgen	equals 2.40
Roman jugerum	equals 0.62
Greek plethron	equals 0.23

An acre is contained in a rectangular field which measures—

10	rods	× 16	rods
8	rods	× 20	rods
5	rods	× 32	rods
4	rods	× 40	rods
5	yards	× 968	yards
10	yards	× 484	yards
20	yards	× 242	yards
40	yards	× 121	yards
80	yards	× 60½	yards
70	yards	× 69½	yards
220	feet	× 198	feet
440	feet	× 99	feet
60	feet	× 726	feet
208.71	feet on a side		
110	feet	× 396	feet
120	feet	× 363	feet
240	feet	× 181½	feet

A field which measures				contains
200	feet	× 108.9	feet	½ acre
100	feet	× 145.2	feet	⅓ acre
100	feet	× 108.9	feet	¼ acre
25	feet	× 100	feet	.0574 acre
25	feet	× 110	feet	.0631 acre
25	feet	× 120	feet	.0688 acre
25	feet	× 125	feet	.0717 acre
25	feet	× 150	feet	.086 acre
2,178	square feet			.05 acre
4,356	square feet			.10 acre
6,534	square feet			.15 acre
8,712	square feet			.20 acre
10,890	square feet			.25 acre
13,068	square feet			.30 acre
15,246	square feet			.35 acre
17,424	square feet			.40 acre
19,602	square feet			.45 acre
21,780	square feet			.50 acre
32,670	square feet			.75 acre
34,848	square feet			.80 acre

A circular acre has a diameter of 235.504 feet
A circular half acre has a diameter of 166.527 feet
A circular quarter acre has a diameter of 117.752 feet
An acre contains 10 square Gunter's chains.

ALMUDE. A Portuguese measure equal to 4.422 American gallons.

ANGULAR MEASURE.

60 seconds .. = 1 minute
60 minutes .. = 1 degree
30 degrees .. = 1 sign
90 degrees .. = 1 quadrant
4 quadrants, or 360° .... = 1 circumference or circle

APOTHECARIES' WEIGHTS.

20 grains	=1 scruple	℈	= 20 grains
3 scruple	=1 dram	ʒ	= 60 grains
8 drams	=1 ounce	℥	= 480 grains
12 ounces	=1 pound	lb	=5760 grains

Drugs are purchased by Avoirdupois Weight.

ARE. One hundred square meters, equal to 119.6 square yards.

ARRATEL or LIBRA. A Portuguese weight equal to 1.011 American pounds.

ARROBA (Dry). A weight used in Spain and Spanish countries. It is equal in

Argentine Republic	to 25.3175	American pounds
Brazil	to 32.38	American pounds
Cuba	to 25.3664	American pounds
Portugal	to 32.38	American pounds
Spain	to 25.36	American pounds
Venezuela	to 25.4024	American pounds

ARROBA (Liquid). A measure used in Cuba, Spain, and Venezuela. It is equal to 4.263 American gallons.

ARSHINE. A Russian measure equal to 28 American inches.

ARSHINE, SQUARE. A Russian measure equal to 5.44 American square feet.

AVOIRDUPOIS WEIGHT. This measure of weight is used in weighing all goods excepting the precious metals, precious stones, and apothecaries' prescription quantities.

27⅓ grains	= 1 dram	=	27⅓ grains
16 drams	= 1 ounce	=	437½ grains
16 ounces	= 1 pound	=	7000 grains
8 pounds	= 1 stone of butcher's meat		
14 pounds	= 1 ordinary stone		
25 or 28 pounds*	= 1 quarter (qr.)		
4 quarters	= 1 hundredweight (cwt.)		
20 cwt.	= 1 ton		

*In nearly all of the United States by law and by practice the hundredweight is 100 pounds and the quarter 25 pounds. In England the legal hundredweight is 112 pounds and the quarter 28 pounds.

BALE. A package most commonly of cotton, wool, or hay. A bale of cotton weighs between 400 and 500 pounds according to the season of the year; a bale of cochineal weighs 1½ hundredweight; a bale of wool, about 2½ hundredweight; a bale of caraway seeds, 3½ hundredweight; a bale of Mocha coffee, 303 pounds; a bale of thread contains 100 bolts; a bale of Rio coffee, 162 pounds.

BARIL. A measure in use in Argentine Republic and Mexico. It is equal to 20.0787 American gallons.

BARREL. A barrel of flour weighs 196 pounds; a barrel of pork or beef weighs 200 pounds; a barrel in liquid measure contains 31½ gallons; a barrel of fish in Maine is by law 200 pounds; a barrel, dry measure, in Louisiana is 3¼ bushels; a barrel of apples contains usually 2¼ bushels; a barrel of potatoes, 2½ bushels or 165 pounds.

BATMAN OF TABRIZ. A Persian weight equal to 6.49 American pounds.

BERKOVETS. A Russian weight equal to 361.12 American pounds.

BONGKAL. An East Indian weight equal to 832 American grains.

BU. A Japanese measure equal to 0.1193 American inch.

BUSHEL. A dry measure containing 8 gallons or 4 pecks. The bushel of the United States is founded on the old Winchester bushel of 2,150.42 cubic inches. But the majority of states have varying bushels by weight for different commodities. The imperial bushel of Great Britain contains 2,218.192 cubic inches and holds 80 pounds of distilled water. It was legally established in 1826. The dimensions of a bushel are: 18.5 inches inside diameter; 19.5 inches outside diameter; 8 inches deep. When heaped, the cone at the top above the rim of the measure must be not less than 6 inches high. A struck bushel is level or even with the top, as in measuring grain. It is equal to 1.24445 cubic feet. A cubic foot is .80356 of a struck bushel. A heaped bushel contains 2747.715 cubic inches; 1 bushel is equal to 9.30918 gallons; 3.5756 bushels make a barrel; 36 bushels make a chaldron.

BUTT. A wine measure equal to 126 United States

gallons. The English butt contains 110 imperial gallons. It is the same as a pipe.

BUTT, SPANISH. A wine measure used in Spain equal to 140 American gallons.

CABLE'S-LENGTH. Ships' cables of chain come in 15-fathom or 90-foot lengths. Eight of these lengths are fastened together with swivels to form a cable of 120 fathoms or 720 feet in length. This 720 feet is the ordinary use. But in navy manoeuvers a cable's-length means 100 fathoms or 600 feet, which is about one tenth of a nautical mile.

CANDY. A weight used in Bombay, India, equal to 529 American pounds. The candy of Madras is equal to 500 American pounds.

CARAT. (1) A jeweler's weight for precious stones. In the United States it is 3.2 grains; in London, 3.17; in Paris, 3.18. It is divided into 4 jeweler's grains or diamond grains. (2) A jeweler's measure of the fineness of gold. Pure gold is considered to be 24 carats fine; if an alloy of 2, 4, or 6 parts be added the gold is then called 22, 20, or 18 carats fine.

CARGA or KIN. A weight used in Mexico and Salvador equal to 300 American pounds.

CATTY. A Chinese weight equal to 1⅓ American pounds. The catty of Japan is slightly less, equal to 1.31 American pounds.

CENTARE. One square meter, equal to 1,550 square inches.

CENTARO. A measure used in Central America and equal to 4.2631 American gallons.

CENTIGRAM. One hundredth part of a gram, equal to 0.1543 grain.

CENTILITER. One hundredth of a liter or 10 cubic centimeters, equal to 0.6102 cubic inch or to 0.338 of a fluid ounce.

CENTIMETER. One one hundredth of a meter, equal to 0.3937 inch, rather more than one third of an inch.

CENTNER. A weight used in

Bremen and Brunswick	equal to 117.5 American pounds
Denmark and Norway	equal to 110.11 American pounds
Prussia	equal to 113.44 American pounds
Sweden	equal to 99.7 American pounds
Vienna	equal to 123.5 American pounds

CHAIN. (1) Gunter's chain is 66 feet long and is made up of 100 links of 7.92 inches each. It contains 22 yards or 4 rods of 5½ yards each. An acre is composed of 100,000 square links. (2) The engineer's chain now most commonly used in the United States is 100 feet long and its links are each one foot.

CHALDRON. An English measure for coals, etc., consisting of 36 bushels or 25½ hundredweight; or, commonly, 32 heaped bushels. The weight varies in United States ports, but is usually 26¼ hundredweight.

CHETVERT. A Russian measure equal to 5.7748 American bushels.

CHIH. A Chinese measure equal to 14 American inches.

CORD. A cord of wood contains 128 cubic feet and is usually piled 4 feet wide, 4 feet high, and 8 feet long.

CUADRA. A measure used in Argentine Republic and equal to 4.2 American acres.

CUBIC OR SOLID MEASURE.

1728 cubic inches	= 1 cubic foot.
27 cubic feet	= 1 cubic yard.
40 do. of rough, or 50 do. of hewn timber	= 1 ton or load.
42 cubic feet of timber	= 1 shipping ton.
108 cubic feet	= 1 stack of wood.
128 cubic feet	= 1 cord of wood.
40 cubic feet	= 1 ton shipping.

CUBIT. A measure originally derived from the length of the forearm. The royal Egyptian cubit used in building the pyramids measured 20.64 English inches; the Roman cubit contained 1½ Roman feet or 17.4 English inches; high authorities place the length of the cubit of the Bible at from 19 to 26 inches. The ordinary cubit is spoken of as 18 inches, and the sacred cubit as 22 inches.

CWT. (HUNDREDWEIGHT). An English weight equal to 112 American pounds. The United States hundredweight and that of Canada are each of 100 pounds.

DAY. The natural, solar, or astronomical day is the measure of the time elapsing between two consecutive returns of the same terrestrial meridian to the sun. The civil day recognized in the United States extends from midnight to midnight. The astronomical or nautical day extends from noon to noon. The civil day contains 24 hours. A sidereal day is 23 hours, 56 minutes, 4.099 seconds, or 3 minutes, 55.901 seconds less than a mean solar day.

DECIGRAM. One tenth gram, equal to 1.5432 grains.

DECILITER. One tenth of a liter or one tenth of a cubic decimeter, equal to 6.1022 cubic inches or to 0.845 gill.

DECIMETER. One tenth of a meter, equal to 3.937 inches.

DEGREE. In angular measure a degree is the 360th part of a circumference. A degree of longtitude measured on the equator is 69.16 statute miles; a degree of latitude at the equator is 68.702 statute miles; and at the poles, 69.396 statute miles. A degree contains 60 minutes or 3,600 seconds.

DEKAGRAM. Ten grams, equal to 0.3527 ounce.

DEKALITER. Ten liters or 10 cubic decimeters, equal to 9.08 dry quarts or to 2.6417 gallons.

DEKAMETER. Ten meters, equal to 393.7 inches, or 32.8 feet, or 10.9 yards.

DESSIATINE. A Russian measure equal to 2.6997 American acres. The Spanish dessiatine is equal to 1.599 American bushels.

DOZEN. A collection of 12 units or similar things. **BAKER'S DOZEN** consists of 13. Brewer says it was good measure given by bakers to secure themselves against severe penalties for light weight. This is sometimes called **LONG DOZEN** or **DEVIL'S DOZEN.**

DRAM or DRACHM. An apothecaries' dram is one eighth of a pound or 60 grains. The avoirdupois dram is one sixteenth of an ounce or 27 11/32 grains.

DRAM, FLUID. One eighth of a fluid ounce; about a teaspoonful. In England it contains 54.8 grains of water and equals 3.55 cubic centimeters; in the United States it contains 57.1 grains and measures 3.70 cubic centimeters.

DRY OR CORN MEASURE.

4 quarts	= 1 gallon
2 gallons	= 1 peck
4 pecks	= 1 bushel
3 bushels (four of corn)	= 1 sack
12 sacks	= 1 chaldron
8 bushels, or two sacks	= 1 quarter
15 quarters	= 1 load

ELL. A cloth measure still used in England. An English ell is 1¼ yards or 45 inches; a Scotch ell was 37 inches; the Flemish ell varied, but was about 27.4 inches; a French ell was 47.245 inches. The English ell is made up of 5 quarters.

FANEGA (Dry). A measure used in

Central America	equal to 1.5745 American bushels
Chile	equal to 2.575 American bushels
Cuba	equal to 1.599 American bushels
Mexico	equal to 1.54728 American bushels

FANEGA (Liquid). A measure of Spain equal to 16 American gallons.

FIRKIN. A measure, usually of butter, which weighs 56 pounds by English law. The measure is really the fourth part of a barrel and varies greatly. A firkin of ale measures 9 gallons.

FLUID MEASURE.

		Marked.
60 minims ℿ	= 1 fluid dram	ƒ 3
8 drams	= 1 ounce	ƒ 3
16 ounces	= 1 pint	O
8 pints	= 1 gallon	*gal.*

FODDER or FOTHER. An old unit of weight of lime, lead, and some other substances. A fother of lead varies from 19½ to 22½ hundredweight of 120 pounds. In American lead mines the word fother is often used for a short ton (2,000 pounds).

FOOT. Originally the length of a man's foot. Contains 12 inches and equals 30.48 centimeters.

3 feet	equals 1 yard
3 feet, 3⅜ in.	equals 1 meter (nearly)
6 feet	equals 1 fathom
16½ feet	equals 1 rod
66 feet	equals 1 Gunter's surveying chain
5,280 feet	equals 1 mile
6,080 feet	equals 1 nautical mile

FRAIL. A Spanish measure of raisins containing 82, 50, or 75 American pounds.

FRASCO. In Argentine Republic a measure equal to 2.5096 American quarts; and in Mexico equal to 2.5 American quarts.

FUNT. A Russian weight equal to 0.9028 American pounds.

FURLONG. Originally the length of a furrow. A measure of length equal to one eighth of a mile, or 40 rods, or 220 yards, or 660 feet, or 7,920 inches. Also equal to 201.17 meters.

GALLON. A measure of capacity for both liquid and dry measures, containing 4 quarts. **LEGAL GALLON OF THE UNITED STATES.** The old wine gallon, containing 231 cubic inches, and equal to a cylinder 7 inches in diameter and 6 inches high. It contains 8.3388822 avoirdupois pounds of distilled water. **IMPERIAL GALLON OF GREAT BRITAIN.** Contains 277.274 cubic inches. The United States gallon is equal to 3.7853 liters.

GARNICE. A measure of Russian Poland equal to 0.88 American gallon.

GILL. A liquid measure equal to ¼ of a pint. The United States gill contains 7.217 cubic inches or 118.35 cubic centimeters. The English imperial gill contains 8.665 cubic inches, or 142 cubic centimeters, or 5 ounces avoirdupois of distilled water, and is one fifth larger than the United States gill.

GRAIN. Originally the weight of a plump grain of wheat.

5,760	grains equals	1 pound troy
7,000	grains equals	1 pound avoirdupois
480	grains equals	1 ounce troy
437½	grains equals	1 ounce avoirdupois
24	grains equals	1 pennyweight
20	grains equals	1 scruple

GRAM. The weight of a cubic centimeter of water at greatest density. Equal to 15.432 grains. A nickel weighs about 5 grams.

GROSS. A measure of 12 dozen or 144 units. Never used in the plural. It is sometimes called a **GREAT GROSS.** A **SMALL GROSS** is 120.

HAIR'S-BREADTH. Estimated at .02083 of an inch (a 48th part).

HAND. A measure of length equal to four inches. Used chiefly in indicating the height of horses. A horse which stands 14 hands high is measured at the fore shoulder and stands about 56 inches or nearly 5 feet high.

HECTARE. Ten thousand square meters, equal to 2.471 acres.

HECTOGRAM. One hundred grams, or 3.5274 ounces avoirdupois.

HECTOLITER. One hundred liters or one tenth of a cubic meter, equal to 2 bushels, 3.35 pecks, or to 26.417 wine gallons.

HECTOMETER. One hundred meters, equal to 328 feet 1 inch.

HOGSHEAD. A liquid measure containing 63 United States gallons or 52½ imperial gallons. A hogshead is one half of a butt, a pipe, or puncheon.

HOUR. The twenty-fourth part of a civil day, or the twelfth part of a natural day or night. Equal to 60 minutes or 3,600 seconds.

HUNDREDWEIGHT. A measure of weight equal, in the United States, to 100 pounds; in England, to 112 pounds. English weight is called long weight. A hundredweight of the United States standard is legal in England for many articles. Written **CWT.** It is one twentieth of a ton and contains 4 quarters.

INCH. The twelfth part of a foot. Formerly divided into 12 lines, and by an old statute into 3 barleycorns. In rough work it is divided into halves, quarters, sixteenths, and thirty-seconds. Gunnery and other processes require division into thousandths, and gauge makers into ten thousandths. The English inch is equal to 2.54 centimeters. The Scotch inch was a little longer than the English. A miner's inch is the quantity of water which passes through an inch square opening in 24 hours under pressure of 6 inches.

JOCH. A measure of Austria-Hungary equal to 1.422 American acres.

KEG. A small cask varying in capacity from 5 to 10 gallons. A keg of powder weighs 25 pounds. A keg of nails weighs 100 pounds.

KEN. A Japanese measure nearly equal to 6 American feet.

KILDERKIN. An old English measure, originally the eighth part of a tun or vat. It contained 2 firkins or one half a barrel. A kilderkin of soap or of ale was 18 United States gallons; of butter, one hundredweight net.

KILOGRAM or **KILO.** One thousand grams, equal to 2.2046 pounds. For rough estimates a kilo is about two and one fifth pounds.

KILOLITER or **STERE.** One thousand liters or one cubic meter, equal to 1.308 cubic yards or to 264.18 gallons in wine measure.

KILOMETER. One thousand meters, equal to 0.62137 mile or 3,280 feet 10 inches. Roughly speaking a kilometer is about three fifths of a mile. To convert kilometers to miles, multiply the number of kilometers by 0.62137. To convert miles to kilometers, divide the miles by 0.62137.

KLAFTER. A Russian measure equal to 216 American cubic feet.

KNOT. A knot is a measure of speed and not of distance. When a vessel travels one knot, it travels one nautical mile in one hour; 20 knots, 20 nautical miles in one hour.

KOKU. A Japanese measure equal to 4.9629 American bushels.

KORREE. A Russian measure equal to 3.5 American bushels.

KWAN. A Japanese weight equal to 8.267 American pounds.

LAST. A measure equal in

Belgium and Holland	to	85.134 American bushels
England (for dry malt)	to	82.52 American bushels
Germany (2 metric tons)	to	4,480 American pounds
Prussia	to	112.29 American bushels
Northern Europe	to	95 American bushels
Spain (for salt)	to	4,760 American pounds

LI. A Chinese measure equal to 2,115 American feet.

LIBRA or **POUND.** A weight equal in

Argentine Republic	to	1.0127 American pounds
Central America	to	1.043 American pounds
Chile	to	1.014 American pounds
Cuba	to	1.0161 American pounds
Mexico	to	1.01465 American pounds
Peru	to	1.0143 American pounds
Portugal	to	1.011 American pounds
Spain	to	1.0144 American pounds
Venezuela	to	1.0161 American pounds

LINE. A unit of length, the twelfth part of an inch; now almost obsolete.

LINK. The one hundredth part of a Gunter's surveyor's chain and equal to 7.92 inches. Engineers use a 100-foot chain wherein the link is one foot.

LITER. One cubic decimeter, the measure of one kilogram of water at greatest density, equal to 0.908 quart dry measure or to 1.0567 quarts wine measure. For rough estimates, a liter is about a quart.

LIVRE or **POUND.** A weight used in Greece equal to 1.1 American pounds.

LIQUID MEASURE.

	Pts.	Qts.	Gals.
Four gills	1	...	...
Quart	2	1	...
Gallon	8	4	1
Firkin or quarter barrel	72	36	9
Kilderkin or half barrel	144	72	18
Barrel	288	144	36
Hogshead of ale (1½ barrel)	432	216	54
Puncheon	800	400	100-130
Butt of ale (3 barrels	864	432	108
Pipe of Port or Masdeu		= 115	Gallons.
" Teneriffe		= 109	"
" Marsala		= 93	"
" Madeira and Cape		= 92	"
Butt of Lisbon and Bucellas		= 117	"
" Sherry and Tent		= 108	"
Aum of Hock and Rhenish		= 80	"
Hogshead of Claret		= 46	"

LOAD. A measure used in England for timber, equal to 50 cubic feet of square timber, or 40 cubic feet of unhewn timber, or 600 superficial feet of 1-inch planks (boards).

LONG MEASURE.

	In.	Ft.	Yd.	Rd.	Ch.	Fur.
Palm	3					
Hand	4					
Foot	12					
Yard	36	3				
Rod, pole, or perch	198	16½	5½			
Chain	792	66	22	4	1	
Furlong	7,920	660	220	40	10	
Mile	63,360	5,280	1,760	320	80	8

PARTICULAR MEASURES OF LENGTH.

12 lines = 1 inch.
3 inches = 1 palm.
4 inches = 1 hand.
2 feet 6 inches = 1 military pace.
5 feet = 1 geometrical pace.
6 feet = 1 fathom.
240 yards = 1 cable's length.
69⅛ miles (one degree) = 60 nautical knots or geographical miles.
3 miles = 1 league.

Inches.	Feet.	Yards.	Rods.	Miles.
12 equals	1			
36 equals	3 equals	1		
198 equals	16½ equals	5½ equals	1	
63,360 equals	5,280 equals	1,760 equals	320 equals	1

MARC. A weight of Bolivia equal to 0.507 American pounds.

MAUND. An East Indian weight equal to 82⅔ American pounds.

METER. Equal to 39.37 inches, or 1 yard 3.37 inches, or 3.281 feet. To convert meters to feet, multiply the meters by 3.281; to convert feet to meters, divide the feet by 3.281. The meter is nearly the ten millionth part of the estimated distance on a meridian between the equator and the pole.

MIL. A measure of Denmark equal to 4.68 American miles.

MILE. The Roman mile (*mille passuum*) consisted of 1,000 paces of 5 feet each. The Roman foot consisted of only 11.62 or 11.65 English inches; so the Roman mile was less than the present mile by 142 or 144 yards. The present English statute mile was defined by an act passed in the thirty-fifth year of the reign of Elizabeth as "8 furlongs of 40 perches, or 16½ feet each," which is equal to 1,760 yards of 3 feet each.

A geographical or nautical mile or a sea mile is

(*a*) the length of a minute of latitude at any point, or

(*b*) the average length of a minute of latitude, equal to 6,082.66 feet, or

(*c*) the length of a minute of longitude on the equator, equal to 6,087.15 feet. The length of a standard geographic mile, according to the United States Coast Survey, is the length of a minute of latitude of a sphere having the same surface as that of the earth, equal to 6,080.27 feet.

The geographical mile of the British admiralty is 6,080 feet.

In the United States a geographical or nautical mile is regarded as equal to 1.15155 statute mile or 1,853.24 meters.

	English miles.
English geographical mile	equals 1.153
German geographical mile	equals 4.611
Tuscan mile	equals 1.027
Scotch mile	equals 1.127
Irish mile	equals 1.273
German short mile	equals 3.897
Prussian mile	equals 4.680
Danish mile	equals 4.684
Hungarian mile	equals 5.178
Swiss mile	equals 5.201
German long mile	equals 5,753
Hanoverian mile	equals 6.568
Swedish mile	equals 6.648
Kilometer	equals 0.621
29 kilometers	(nearly) equals 18.

MILLIER, or TONNEAU, *or* METRIC TON. One million grams, equal to 2,204.6 pounds.

MILLIGRAM. One thousandth part of a gram, equal to 0.0154 grain.

MILLILITER. One thousandth part of a liter or one cubic centimeter, equal to 0.061 cubic inch or to 0.27 fluid dram.

MILLIMETER. One thousandth part of a meter, equal to 0.0394 inch.

MINIM. The lowest unit of measurement in apothecaries' liquid measure. A minim bears the same relation to the fluid units that a grain does to the solid units. There are 60 minims in a fluid dram, 480 minims in a fluid ounce. A minim is generally regarded as being equal to a drop.

MINUTE. (1) In angular measure, the sixtieth part of a degree—60 seconds. (2) The sixtieth part of an hour—60 seconds.

MONTH. A solar month is one twelfth part of a solar year, and contains 30 days, 10 hours, 29 minutes, 4 seconds. The interval from new moon to new moon is called a lunar, synodical, or illuminative month and has a mean value of 29.530589 days or 29 days, 12 hours, 44 minutes, and 2.7 seconds. The calendar months are January, 31; February, 28 or 29; March, 31; April, 30; May, 31; June, 30; July, 31; August, 31; September, 30; October, 31; November, 30; and December, 31.

MORGEN. A measure of Prussia equal to 0.63 American acre.

MYRIAGRAM. Ten thousand grams, equal to 22.046 pounds.

MYRIAMETER. Ten thousand meters, equal to 6.2137 statute miles.

NAIL. In cloth measure a nail is 2¼ inches or 1/16 of a yard.

OKE. A weight equal in

Egypt	to	2.7225	American pounds
Greece	to	2.84	American pounds
Hungary	to	3.0817	American pounds
Turkey	to	2.82838	American pounds
Hungary and Wallachia	to	2.5	American pints
China, Japan, and Sumatra	to	133⅓	American pounds
Philippine Islands	to	137.9	American pounds

OUNCE. A weight; one twelfth of a pound troy; one sixteenth of a pound avoirdupois. The troy ounce contains 480 grains; the avoirdupois ounce, 437½ grains.

OUNCE, FLUID. The British fluid ounce is equal to the bulk of 437.5 grains (an avoirdupois ounce) of distilled water at 62° Fahr.; the United States fluid ounce is 1/128 of a gallon and contains 456.033 grains of distilled water at 62° Fahr. The British fluid ounce is equal to 28.4 cubic centimeters; the United States fluid ounce, to 29.57 cubic centimeters. A fluid ounce is 1/16 of a pint.

PALM. A measure of length equal to either the width of the hand or to 3 and, sometimes, 4 inches. The same as hand.

PAPER, SIZES OF.

FOLDED.

Seven-column	Quarto	35 x 48 inches

PECK. The fourth part of a bushel, or 8 quarts, used in dry measure. The United States peck contains 537.6 cubic inches and is the fourth part of a Winchester bushel. The British imperial peck contains 2 gallons or 554.548 cubic inches.

PENNYWEIGHT. Originally the weight of the old Anglo-Norman silver penny—22½ grains. It is now reckoned in apothecaries' weight and in jeweler's weight at 24 grains or one twentieth of a troy ounce. Written dwt.

WEIGHTS AND MEASURES OF THE PHILIPPINES.

1 pulgada (12 linea) equals .927 inch.
1 pie equals 11.125 inches.
1 vara equals 33.375 inches.
1 gantah equals .8796 gallon.
1 caban equals 21.991 gallons.
1 libra (16 onzo) equals 1.0144 lb. av.
1 arroba equals 25.360 lb. av.
1 catty (16 tael) equals 1.394 lb. av.
1 pecul (100 catty) equals 139.482 lb. av.

PIE. A measure equal in Argentine Republic to 0.9478 American foot, and in Spain to 0.91407 American foot.

PIG. A unit of weight for lead, equal to 301 pounds.

PIK. A measure in Turkey equal to 27.9 American inches.

PINT. A measure equal to one half quart. The United States, or old wine pint, contains 28.875 cubic inches; the English imperial pint, 34.65925 cubic inches; the old customary ale pint, 35.25 cubic inches; and the old Scotch pint, about 3 old ale pints or 105 cubic inches.

PIPE. A measure of wine varying according to the sort of wine. Ordinarily a pipe is 105 imperial or 126 United States gallons. Two pipes of 105 imperial gallons or 210 imperial gallons make a tun.

POINT. A measure or unit in navigation equal to one eighth of a right angle or 11¼°. It is the angle between adjacent points of the compass. This is the term used when saying "to bring the ship up half a point."

POINT. A measure in typography used to regulate and define the bodies of type. A point is about one seventy-second of an inch. This method of measuring the height of type was originated in 1737 by Fournier the younger, a type founder of Paris. The French measure is larger than that which the United States Type Founders' Association adopted in 1883. The latter felt that the French standard would cause too great a disturbance in the thoroughly established system of the United States. The following table, showing the face of the type up to 12 point, will give the old name and the new point size of type commonly used:—

Thus 8-point type means that the body of the type stands eight seventy-seconds of an inch or one ninth of an inch high. The face of a type is not always the same height as the body. Twelve points, or twelve seventy-seconds of an inch, equal one em pica. Hence, 6 pica ems make about one inch.

Points.	Name of Type.	
3	Excelsior.	
3½	Brilliant.	
4	Semibrevier.	
4½	Diamond.	abcdefghijklmnopqrstuvwxyz
5	Pearl.	abcdefghijklmnopqrstuvwxyz
5½	Agate.	abcdefghijklmnopqrstuvwxyz

22	Two-line small pica.	
24	Two-line pica.	
28	Two-line English.	
32	Four-line brevier.	
36	Three-line pica.	
40	Double paragon.	
44	Four-line small pica.	
48	Four-line pica.	

POOD. A weight in Russia equal to 36.112 American pounds.

POUND, AVOIRDUPOIS. Composed of 7,000 grains. A cubic inch of water weighs 252.458 grains and this weight determines the grain. An avoirdupois pound is 1.21528 of a troy pound.

POUND, TROY. Composed of 5,760 grains. A troy pound is .82286 of an avoirdupois pound.

PUNCHEON. A cask, containing from 72 to 126 gallons.

PUND. A weight in Denmark and Sweden equal to 1.102 American pounds.

QUART. The fourth part of a gallon.

The United States liquid quart equals 0.9468 liter
The United States dry quart equals 1.1017 liters
The English imperial quart equals 1.1359 liters
The Scotch quart equals 3.398 liters

QUARTER. In cloth measure is a quarter of a yard, or 4 nails. Five quarters make an English ell.

QUARTER. A measure in Great Britain equal to 8.252 bushels. For measuring coal the use in London is 36 bushels.

QUARTER. A measure of weight in the United States equal to 25 pounds; in England, to 28 pounds. It is one quarter of a hundredweight. Used chiefly in weighing grain.

QUINTAL. A weight equal in

Argentine Republic to 101.42 American pounds
Brazil to 130.06 American pounds
Castile, Mexico, Chile, and Peru to 101.41 American pounds
Greece to 123.3 American pounds

In ordinary commercial use in the United States and Canada a quintal of fish (usually cod) weighs 100 pounds.

QUINTAL. One hundred thousand grams, equal to 220.46 pounds.

QUIRE. A measure of paper consisting of 24 sheets; the twentieth part of a ream.

REAM. A quantity of paper consisting of 20 quires of 24 sheets each for writing paper—480 sheets in all. Some drawing paper reams are from 472 to 500 sheets; and a printer's ream contains 516 sheets or 1½ quires above the ordinary to allow for waste in printing.

ROD. A measure of length composed of 5½ yards, or 16½ feet, or 198 inches. It is also called a perch or pole.

40 rods equals 1 furlong
320 rods equals 1 mile

ROD, CUBIC. The usual standard for measuring brick work; sometimes spoken of as a "perch of masonry." It is generally taken at 25 cubic feet, but sometimes at 22; though a cubic rod or perch contains 24¾ cubic feet. This is calculated as being 16½ feet long by 1½ feet by 1 foot. It is being replaced by the cubic yard.

SAGENE. A Russian measure equal to 7 American feet.

SCORE. A measure of 20 units; used as an exact measure only in the singular, though the general expression "scores of writers" is used. Score is derived from an Anglo-Saxon word to cut; and when tally was kept by cutting notches on a stick, the twentieth was scored or cut in deeper than the others. It was *the* score.

SCRUPLE. Used now only in apothecaries' weight. It is one third of a dram and is made up of 20 grains, equal to 1.296 grams.

SE. A Japanese measure equal to 0.02451 American acre.

SECOND. (1) In angular measure the sixtieth part of a minute. (2) The sixtieth part of a minute.

SEER. An East Indian weight equal to 1 pound and 13 ounces (American).

SHAKU. A Japanese measure equal to 11.9305 American inches.

SHO. A Japanese measure equal to 1.6 American quarts.

SHOEMAKER'S SIZES. Number 1 is 4.125 inches and every succeeding number is one third of an inch. There are 28 numbers in all, arranged in two series: from 1 to 13 and from 1 to 15.

SPAN. A measure of length equal to 9 inches or half a cubit. It was originally the distance between the tip of the thumb and of the little finger when outstretched.

SQUARE. An architect's measure of 100 square feet.

SQUARE OR SURFACE MEASURE.

	In.	Ft.	Yds.	Pls.	Ch.	R.
Square foot	144	1				
Square yard	1,296	9	1			
Rod, pole, or perch	39,204	272¼	30¼	1		
Square chain	627,264	4,356	484	16	1	
Rood	1,568,160	10,890	1,210	40	2½	1
Acre	6,272,640	43,560	4,840	160	10	4

A square mile contains 640 acres, 2,560 roods, 6,400 chains, 102,400 rods, poles, or perches, or 3,097,600 square yards.

STANDARD. In St. Petersburg this is used as a lumber measure equal to 165 American cubic feet.

STERE. See KILOLITER.

STONE. A British weight equal to 14 pounds avoirdupois.

SUN. A Japanese measure equal to 1.193 American inches.

TAN. A Japanese measure equal to 0.25 American acre.

MEASURE OF TIME.

60 seconds	= 1 minute.
60 minutes	= 1 hour.
24 hours	= 1 day.
7 days	= 1 week.
28 days	= 1 lunar month.
28, 29, 30, or 31 days	= 1 calendar month.
12 calendar months	= 1 year.
365 days	= 1 common year.
366 days	= 1 leap year.

STANDARD TIME. Standard time was introduced, first by railroads, in 1883. The United States extends between 65° and 125° west longitude. This space of 60° is divided into 4 time sections of 15° each, exactly equivalent to one hour.

Eastern Standard time includes all of the territory between the Atlantic coast and an irregular line drawn from Detroit to Charleston, S. C.

Central Standard time extends from the last named line to an irregular line drawn from Bismarck, N. D., to the mouth of the Rio Grande.

Mountain Standard time extends from the last named line to (nearly) the western borders of Idaho, Utah, and Arizona.

Pacific Standard time is used in the rest of the country to the Pacific coast.

The difference of time in these sections as one passes from east to west through them is exactly one hour. If a passenger on a train starts from New York City at 12 o'clock noon (Eastern time), his watch, when he arrives at Chicago (Central time), will be one hour fast, for it will be only 11 a.m. there; at Denver his watch will be two hours fast and will show 12 noon when it is only 10 a.m. there. This difference of time was noted markedly in the east during the Democratic Convention at Denver in July, 1908, when it was 10 o'clock at night in New York and Boston when the convention meeting assembled at Denver at 8 o'clock (Mountain time). At San Francisco our traveler's watch would show 12 noon when it is only 9 a.m. (Pacific time).

Standard time at Boston is 16 minutes slower than true Boston time; it is 4 minutes slower at New York, 8 minutes faster at Washington, 19 minutes faster at Charleston, S. C., 28 minutes slower at Detroit, 18 minutes faster at Kansas City, 10 minutes slower at Chicago, 1 minute faster at St. Louis, 28 minutes faster at Salt Lake City, and 10 minutes faster at San Francisco.

BELL TIME ON SHIPBOARD.

Time, A. M.		Time, A. M.		Time, A. M.	
1 Bell,	12.30	1 Bell,	4.30	1 Bell,	8.30
2 Bells,	1.00	2 Bells,	5.00	2 Bells,	9.00

7 "	3.30	3 "	7.30	7 "	11.30
8 "	4.00	4 "	8.00	8 "	Midnight

On shipboard, for purpose of discipline and to divide the watch fairly, the crew is mustered in two divisions: the Starboard (right side, looking toward the head) and the Port (left). The day commences at noon, and is thus divided: Afternoon Watch, noon to 4 P. M.; First Dog Watch, 4 P. M. to 6 P. M.; Second Dog Watch, 6 P. M. to 8 P. M.; First Watch, 8 P. M. to Midnight; Middle Watch, Midnight to 4 A. M.; Morning Watch, 4 A. M. to 8 A. M.; Forenoon Watch, 8 A. M. to noon. This makes seven Watches, which enables the crew to keep them alternately, as the Watch which comes on duty at noon one day has the afternoon next day, and the men who have only four hours' rest one night have eight hours the next. This is the reason for having Dog Watches, which are made by dividing the hours between 4 P. M. and 8 P. M. into Watches. Time is kept by means of "Bells," although sometimes there is but one Bell on the ship.

Time Difference.

HOLIDAYS.

There are no National holidays; but Congress may appoint them. It made Labor Day a holiday in District of Columbia. The President designates Thanksgiving, which makes it a holiday in District of Columbia and the Territories.

The legal holidays in all states including Alaska and District of Columbia are: Feb. 22, Washington's Birthday; July 4, Independence Day; the last Thursday in November, Thanksgiving Day; and December 25, Christmas Day. January 1, New Year's Day, is legal in all but Massachusetts; the first Monday in September, Labor Day, in all but New Mexico, Wisconsin, and Wyoming. February 12, Lincoln's Birthday is celebrated in most of the northern states, while January 19, Robert E. Lee's Birthday, is legal in Alabama, Florida, Mississippi, North Carolina, and South Carolina; June 3, Jefferson Davis's Birthday, is a holiday in South Carolina, Texas, Tennessee, Alabama, Florida, Georgia, and Mississippi.

Arbor Day is a regular holiday in Maryland, Nebraska, Rhode Island, Utah, and Wyoming, though on different dates in April or May; Good Friday, in Connecticut, Delaware, Louisiana, Maryland, Minnesota, New Jersey, and Tennessee. Memorial or Decoration Day is observed on April 26 in Alabama, Florida, Georgia, and Mississippi; May 10, in North and South Carolina; June 3, in Louisiana; May 30, in all the others but New Mexico, Tennessee, and Texas, which have none. October 12, Columbus Day, is legal in 25 of the states, and Election Day, usually in November, in 27 states. All holidays, days of fasting or thanksgiving, appointed by the Governors of the states or the President, are legal.

Several of the states have special holidays as follows: Alabama, April 13, Thomas Jefferson's Birthday, Tuesday before Ash Wednesday, and Mardi Gras Day; California, September 9, Admission Day; Colorado, August 1, Colorado Day; District of Columbia, Inauguration Day, every fourth year; Delaware, Election Day, third Tuesday in February and again in November; Florida, Shrove Tuesday; Georgia, February 12, Georgia Day; Idaho, June 15, Idaho Pioneer Day; Louisiana, January 8, Battle of New Orleans, Mardi Gras Day (in parish of Orleans); Maine and Massachusetts, April 19, Patriots' Day; Maryland, September 12, Defenders' Day, and November 23, Repudiation Day; Nevada, October 31, Admission Day; New Hampshire, Fast Day (appointed by the Governor in April); North Carolina, April 12, Halifax Independence Resolutions; May 20, Anniversary of signing of Mecklenburg Resolutions; South Carolina, first Monday in September and Thursday of Fair Week, wherever the State Agricultural Mechanical Society holds fair; Tennessee, second Friday in May, Confederate Day; Texas, March 2, Texas Independence, and April 21, Battle of San Jacinto; Utah, July 24, Pioneer Day; Vermont, August 16, Battle of Bennington.

Table of Days Between Two Dates.

31	396	....	455	....	516	....	577	608	....	669	....	730

The above table applies to ordinary years only. For leap year, one day must be added to each number of days after February 28.

EXAMPLE.—To find the number of days between June 3, 1900, and February 16, 1901: The figures opposite the third day in the first June column are 154; those opposite the sixteenth day in the second February column are 412. Subtract the first from the second product—*i. e.*, 154 from 412, and the result is 258, the number of days between the two dates.

REFORMING THE CALENDAR. The first attempt to reform the calendar was made by Julius Caesar in 45 B. C. He ordered that every year exactly divisible by 4 should have 366 days and all the others 365 days. As the sixth day before the kalends of March was counted twice in leap years, they were called *bissextile* years. He ordered also that the beginning of the year be changed from March 1st to January 1st. The fifth month, formerly called Quintilis, was named July after himself. By Caesar's arrangement the average length of the year was 365¼ days, which was too great by 11 minutes and 14 seconds. This excess amounted to about 3 days in 400 years.

GREGORIAN CALENDAR. The Gregorian calendar is named after Pope Gregory XIII., by whom it was introduced. It consists of a year of 365 days, excepting those years which are exactly divisible by 4. The centurial years, such as 2100, 2200, etc., are not considered as leap years unless they are exactly divisible by 400. This arrangement corrects the error of Caesar's or the Julian calendar. The length of the average year of the Gregorian calendar is, therefore, 365 days, 5 hours, 49 minutes, 12 seconds. England and her colonies introduced the use of the Gregorian calendar in 1752, when it was necessary to drop 11 days from the calendar, as there had been that difference since the Council of Nice in 325. September 3, 1752, was called September 14, 1752. At the same time the beginning of the legal year was changed in England from March 25 to January 1. The difference between the Julian and the Gregorian calendars is now 13 days. Russia and the Greek Church yet use the Julian calendar.

TO. A Japanese measure equal to 2 American pecks.

TON. A measure of weight equal to 20 hundredweight. In England it is 2,240 pounds, a long ton; in the United States, 2,000 pounds, a short ton.

A ton of round timber equals 40 cubic feet.
A ton of hewn timber equals 50 cubic feet.
A ton of flour equals 8 sacks or 10 barrels.
A ton of potatoes equals from 10 to 36 bushels.
A ton of wheat equals 20 bushels.
A ton of earth or ground equals 1 cubic yard or 23 cubic feet.
A ton of grindstones equals 15 cubic feet.
A ton of Portland stone equals 16 cubic feet.
A ton of salt equals 42 bushels.
A ton of lime equals 40 bushels.
A ton of coke equals 28 bushels.
A ton carrying capacity of a freight ship equals 40 cubic feet.

TON, METRIC. The weight of 1,000 kilograms, equal to 2,204.6 pounds.

TONDELAND. A Danish measure equal to 1.36 acres.

TONNAGE. Tonnage may refer to either the vessel ton or to the cargo ton.

Vessel tonnage is either displacement, gross register, or net register.

Displacement tonnage is the weight of the vessel and is equal to the weight of water displaced by the floating vessel.

Gross register tonnage is found by dividing the number of cubic feet in the capacity of the ship by 100. A vessel has one "gross" ton for each 100 cubic feet of capacity.

Net register tonnage is found by dividing by 100 the capacity in cubic feet of the space in which cargo and passengers may be carried.

Cargo ton is estimated by both weight and measurement. In the weight estimate, the short ton of 2,000 pounds, the long ton of 2,240 pounds, or the metric ton of 2,204.62 pounds may be used.

When cargo is shipped, not by weight but by measurement, 40 cubic feet of space is estimated to hold a ton. This is said to be the space occupied by a long ton of wheat and is used as the standard.

TSUN. A Chinese measure equal to 1.41 inches.

TUN. A measure of liquid equal by statute to 252 old wine or United States gallons. Equal to two butts or pipes of 126 gallons each.

TUNNLAND. A Swedish measure equal to 1.22 acres.

VARA. An old Spanish measure of about 33 inches.

VEDRO. A Russian measure equal to 2.707 gallons.

VERST. A Russian measure equal to 0.663 (or nearly two thirds) American mile.

VLOCKA. A measure of Russian Poland equal to 41.98 American acres.

WEEK. A period of 7 consecutive days, of which Sunday is the first day (usually so reckoned). There are 52 weeks in a year. A period of 2 weeks is a fortnight, an abbreviation for 14 nights.

YARD. The standard unit of long measure, composed of 3 feet or 36 inches. It is equal to 91.44 centimeters.

5½	yards	equal 1 rod
240	yards	equal 1 cable's-length
1760	yards	equal 1 mile
2026.6	yards	equal 1 nautical mile

YEAR. The period of the earth's revolution around the sun, about 365 days, 5 hours, 48 minutes, and 47 seconds. The sidereal year is 365 days, 6 hours, 9 minutes, and 9.3 seconds. A period of 12 calendar months. As we reckon 365 days to the year, that is (as seen above) 5 hours, 48 minutes, and 47 seconds too short. Accordingly once every four years a day is added to the year, making it 366 days. But by so doing we add the equivalent of 6 hours to each year, which is too much. To correct this error we do not make a leap year of any year which can be divided by 400.

IMPORTANCE OF GEOGRAPHY.

No one subject has a more universal appeal han that of Geography. We live in a world of Geography. Our food is a constant reminder f the parts of the globe in which it is produced. Our daily newspapers are a fund of geographical acts. Our amusements have many references o the subject. We get new conceptions of the ity, the state or the world every time we take n automobile trip. Even our business success nay depend to a great extent upon our geographical knowledge. Is there need to ask further, why we should study Geography?

Our world is growing smaller. By this we nean that it is easier to get from one part to nother and the details and existence of the nce unknown parts are being opened up to us ery rapidly. For example, it is not so far ack that the daily newspaper was a luxury, nly afforded in the homes of few. Today the verage family buys not only one but usually wo, the morning and evening editions. Information is thus being scattered, but with the ttempt to read a newspaper intelligently a ertain amount of geographical knowledge is necessary. The morning headline, **An Uprising in the Ruhr District**, means what? To what country does it belong, or what are its resources and people, are questions that rise at once? The newspaper not only gives a lot of geographical information but demands a knowledge of conditions as well.

The telephone, the telegraph and the radio were all epoch-making discoveries and have revolutionized our manner of living and thinking. World facts are brought to our attention in an almost unbelievably short time and thus gives us a truer picture of what is happening. The radio nightly is disseminating information. When out of the air comes "K. D. K. A." Pittsburgh, the question immediately arises, where is the city or how large is it, or what are the main factors in its location?

The motion pictures is one of the great forces in the world today and must be reckoned with as such. Millions sit every night to see their favorite actress, the film version of their favorite book or some stupendous spectacle, and is this not all linked up with Geography? What about the news reels, the travelogues that are purely

Geography, or the scenes laid in Alaska, in the streets of Rome, the mob scenes in old Paris during the French Revolution, the sets in Merrie Old England under Robin Hood.

One out of every seven persons in the United States owns an automobile. With it they have been able to see and visualize that world around them that they had never seen before. In their vacation period longer trips are taken, so that the dream of every man or woman of seeing Niagara Falls or Washington, D. C. is usually realized. All this is Geography, the seeing of mountains, rivers, valleys, peoples and strange places.

We are entering into a stage of expansion in our foreign trade and foreign service. The future of many a man and many a business house may be absolutely dependent upon a knowledge of simple geographical facts. Our schools and colleges are realizing this need and are adding new courses on world geography. In one of our largest Eastern Universities they already have six such listed courses on their curriculum.

Politically we are fast becoming entangled in European politics, in resources, boundary lines, peoples, debts and changing governments. To vote intelligently a knowledge of these facts must be before the public and these facts are geographical ones. To decide such public questions, greater knowledge must be had on all points.

These are the reasons for the great and growing importance of the field of Geography. No intelligent citizen, no intelligent business man, and most of all no intelligent parent dare to be without certain of these facts. Upon us, upon you, depends how the children of today—your children, are trained for this new and everchanging world of tomorrow. Dare we fall down in this task?

HISTORY OF GEOGRAPHY.

The ideas which people in all ages have had concerning the shape and size of the world seem ludicrous to us today. One of the earliest conceptions was that the earth was a flat circular surface, entirely surrounded by water and the sky was an inverted bowl-shaped dome of blue placed over this surface. Again it was taught that if a ship sailed far enough out, it would drop off the edge of the world into a great abyss, lost forever. Some philosophers taught that the earth was a solid body hung freely in the center of a hollow sphere of starry heavens. Another conception was that of the idea of symmetry, that is for example, the Egyptians figured that the Nile River must flow west to east before turning north in order to balance the Danube River which flows west to east before turning south. Then from a circular shape the pictures of the world began to take more of the shape of an eliptical band as more territory come to be known and included. Thus our geography started out with weird and fantastic notions which were gradually dispelled and cleared up as explorers and travelers brought us more exact knowledge of the world.

One of the first steps in this direction was when Erosthenes, librarian at Alexandria about 225 B. C., calculated the circumference of the earth by means of the shadows cast by the sun. He found it to be approximately 25,000 miles, which is astonishingly accurate considering the means he had at his disposal. Gradually the seafaring men and travelers brought back information that changed our ideas of shape and size of the world.

Men like Marco Polo, in his journeys to the East, Munster who for the first time added a list of products, industries and peoples to Geography, the Phoenicians, the first great commercial traders and explorers, and Ibn Batula, who in the fourteenth century traversed northern Africa, Asia Minor, China and Central Asia, covering an area approximately 70,000 miles square, all these added to our stock of knowledge and brought the conception of the world to a point nearer the truth. Then came the moderns; Columbus, who in 1492 crossed the Atlantic to America; Magellan, who first circumnavigated the globe; LaSalle, who first saw the Mississippi River; Balboa, the first man from the West to see the Pacific Ocean; Humboldt, the great traveler and writer; Cartier, who journeyed up the St. Lawrence River, and into Canadian territory before his contemporaries; De Soto, Drake, Terres and many others, all helped to swell our stock of geographical knowledge. Our world ideas are still being revised and changed by such men as Peary, the discoverer of the North Pole; Stefansen, who gave us much information concerning the Antarctic regions; the small band of Englishmen, who have attempted to climb Mt. Everest in the Himalaya Mountains; or William Beebe and his explorations in the Galapagos Island or the Sargasso Sea. Gradually then by discovery after discovery, and with each succeeding exploration, our stock of knowledge has increased to where we have a fairly truthful picture of the world we live in.

DIVISIONS OF GEOGRAPHY.

For purposes of classification and clearness, Geography may be sub-divided into bio-geography (biological geography), commercial or economic geography, physical geography, and political geography.

Bio-geography (biological geography). As one travels from one part of the world to another, the change in plant and animal life is very noticeable. From the great extremes of the desert area, where sage brush and cactus reign supreme, to the very edge of the glaciers, in the small valleys thousands of feet high in the mountains, where wild flowers grow and bloom in great luxuriousness, we can only find the answer to this lack of similarity in the great difference in climate and elevation. In the Arctic zone the musk-ox and the polar bear survive; in the Temperate, the red fox, the grizzly bear, the bison and the buffalo; while in the Torrid zone we find the elephant, hippopotamus and the rhinoceros. Illustration after illustration could be given to show how the difference in elevation, rainfall, nearness to water bodies, general climate and physical location are some of the important causes of the variety of plant and animal life. The study of the effect of these physical factors on the flora (plant) and fauna (animal) life of the country or world is called bio-geography.

Commercial or Economic Geography. Commercial geography deals with the industrial life of

a nation as its industry is affected and influenced by physical factors. Trade routes, trade movements, the location of raw materials and natural resources, are factors in the location of an industry. New York's commercial supremacy was laid through the building of the Erie Canal in 1825 through the low Mohawk Valley, enabling her to have an easy outlet to the West and western products, whereas both Philadelphia and Baltimore failed to keep up with New York because of the Appalachian Barrier. The rapid industrial growth of the city of Chicago is another illustration of the importance of geographical location. If the new plans for the Welland Canal are carried through, enabling ocean-going vessels by means of the St. Lawrence, Canal, Lake, route to enter the Harbor of Chicago, there is every reason why Chicago will become the metropolis of the United States, and possibly of the world. It is in the centre of probably the most fertile agricultural region in the world. Again Illinois has become the second leading state in the Union, in the production of bituminous coal. To the north of Chicago lies the Missabe Range, the greatest body of iron ore in the United States. Hence it is apparent that Chicago being midway between the sources of supply, the coal and iron ore fields, is in better position to compete with other cities, especially in that most important commodity, steel manufacturing, because of the material reduction in the cost of transportation.

Nor should we overlook the fact that with the gradually shifting westward of the Centre of Population, will come another distinct advantage to Chicago. It can be readily seen why Chicago should become the steel manufacturing centre of United States. Already it is making great strides in this respect to the corresponding loss of the City of Pittsburgh. The abolishment of the Pittsburgh Plus Plan has also added impetus to the development of its steel business.

In addition, more railroads enter Chicago than any other city in the Union, making it the natural hub for the incoming of raw materials, and again, equally facilitating the distribution of manufactured products. The backwardness of the peoples in the Kentucky Mountains and the Ozark Plateau is due in large part to the mountains which have prevented good roads and thus cut them off from the outside world. The great strides that Pittsburgh has made in iron and steel is due to nearness to good coking coal, plenty of limestone, river transportation and the ease and cheapness of bringing the iron ore down the Great Lakes. The supremacy of the United States in her three great crops, corn, cotton and wheat is due to climate and natural fertility of the land. One cannot over-estimate the importance of knowing fundamental geographical facts, either in the planning of business, or in that individual question of definite location in the earning of one's livelihood. Innumerable illustrations could be used to show how our entire industrial, agricultural and commercial life has been more or less influenced and shaped by these physical and geographical factors.

Physical Geography. This section has been divided into two parts to make analysis easier. The first deals with relative position and measurement of space, form and size, often called mathematical geography and the other, the description of the physical features of the earth. The first division deals with the distances of the earth from the planets, stars and the sun.

In order to designate distances on the earth we have devised parallels of latitude and meridians of longitude.. The representation of the earth on a flat surface is called cartography. Here the relative positions on land elevations, water masses, coastal indentations, seas, rivers, valleys, hills, plains and mountains are given and must be on a mathematical scale and correct. All this calls for exact measurements. The other division of physical geography may be subdivided into three parts, lithosphere, hydrosphere, and atmosphere.

Lithosphere is a study of the land forms of the earth. It includes their distribution, mode of origin and formation, as well as the forces that built or are building the earth, and the tearing down or destructive forces. Explanations of such phenomena as faulting, uplifts, volcanoes, and earthquakes are given. Rivers, lakes, glaciers, monadnocks, gorges, waterfalls, etc., are all discussed as well as the eroding forces of water, glaciers, winds, acids, heat and cold.

Hydrosphere concerns itself with the large salt water areas, seas, oceans, bays, and gulfs. This water area comprises 72% of the surface of the globe. Ocean depths; temperatures of the waters; causes of waves and wave actions; tides, their causes and effects; currents or drifts, their causes and effects, together with the direction of their movement and resulting effect on land areas; all are touched.

Atmosphere. The third division treats of the air; its composition, density at sea level and rarity at heights, its barometric pressure; winds, cause and effect of their movements; clouds; cyclonic and anti-cyclonic areas with their resulting effect upon the weather; and the explanation of the phenomena of rain, frost, dew, hail, ice, snow, haze, and fog.

Political Geography. Natural barriers, mountains, seas, rivers, natural resources, people, and their customs, all have an effect upon political situations and natural aspirations of a people. The weakness in the new state of Poland lies, in the first place in that she has no natural boundaries for protection and in the second place that her rich natural resources are desired by Germany, Russia, and Austria, thus causing conflict and strife because of the geographical location of these natural resources.

The new Austria is but a fragment of its former self, the old Austria-Hungary empire. Her minerals, forests, water-power all were divided among the bordering nations, leaving only the great plain area surrounding the City of Vienna. A country with so few natural resources could not be self-supporting and as a result, we again have the recurring agitation of Austria uniting with Germany as an economic necessity. Political Geography deals with the resulting political effects of Natural Geographical causes. In order to understand therefore the various phases of political affairs, a knowledge of the geographical background and their influences are necessary.

ASTRONOMY.

Stars.—Stars are suns. They are so far away that they appear very small and their motions make only very slight changes in their apparent positions. The nearest star known to us is 275,000 times as far from us as we are distant from the sun, *i. e.*, 275,000 times 94,000,000 miles. The light from the stars travels at the rate of 186,330 miles per second. There are probably over 100,000,000 stars either visible or capable of affecting delicate photographic apparatus. Only 5,000 are visible to the naked eye. The stars are divided into magnitudes based upon the amount of light they send to us. There are 20 of the first magnitude, 65 of the second, 190 of the third, 425 of the fourth, 1,100 of the fifth, and 3,200 of the sixth. There are in all about 200,000 stars in the first nine magnitudes. The light received from a first magnitude star is 100 times that received from a sixth magnitude star. The motion of the stars, while considerable, is apparently very slight, because they are so far away. The greatest motion apparent to us is that of an eighth magnitude star in the southern heavens, which passes through an arc of 8.7 seconds in a year. At this rate it would take 220 years to traverse a space equal to the apparent diameter of the moon. The earliest known catalogue showing the positions of the stars is that of Hipparchus (100-170), who listed 1,080 stars; Tycho Brahe (1546-1601) listed 1,005 stars in 1580; Lalande (1732-1807) noted 47,390 stars; Argelander (1799-1875), 324,198 stars all in the northern hemisphere; Schönfeld (1828-1891) added 133,659 stars from the southern hemisphere; Gould (1824-1896) added 32,468 stars in Argentina; and a movement is now on foot to photograph the entire area of the heavens, requiring 22,000 plates, though for the present only about a million and a quarter of the brightest stars will be measured and catalogued. The Milky Way is a band of light about 20° wide extending entirely around the sky and composed of myriads of small stars visible by instruments. The Pole Star, or Polaris, is a second magnitude star in the constellation Ursa Minor, or the Little Bear. Its height above the horizon is the latitude of the place. In the Big Dipper, or Ursa Major, there are two stars which form the side of the dipper farthest from the handle. The line of these two, when produced about five times their distance apart, will strike the Pole Star. For this reason the two stars are called pointers. Polaris is a double star, one part is a star a little fainter than the second magnitude, the other a little fainter than the ninth. The parts are 18.5 seconds distant from one another. It takes the light from the North or Pole Star over 40 years to reach us. If from any cause Polaris ceased to emit light, it would be more than 40 years before we should find that fact out. A convenient sort of celestial yardstick is the distance from the first pointer of the Dipper to the Pole Star, which is about 28°. The distance between the two "pointers" is about 5° 20′. The diameter of the moon is about half a degree.

Constellations.—These are groups of stars classified by the religion of the ancients and preserved by astronomers for convenience in locating individual stars. *Ursa Major*, or the Greater Bear, contains the familiar Big Dipper. It is estimated that it takes the light from this system over 100 years to reach us. Mizar, a star at the bend of the handle, is a notable double star. Near it is a little star, Alcor, of the fifth magnitude. *Cassiopeia* is in a line from the middle of the handle of the dipper, through the North Star, and about 30° on the other side of the North Star. Polaris is about midway between these two constellations. Cassiopeia takes the form of a W composed of seven stars. Light from this system reaches us in a little more than nine years. *Lyra* is noted for its bright, conspicuous star, Vega. If the sun were as far from us as Vega now is, the sun would be only $\frac{1}{100}$ as bright as Vega is. *Hercules* lies between Lyra and Corona Borealis. It contains one star of the second magnitude, nine of the third, and twelve of the fourth. There is in it one of the most remarkable star clusters in the whole sky, visible to the naked eye on a clear, dark night. *Scorpio*, one of the constellations of the Zodiac and the finest of the southern constellations visible in the north, lies in the Milky Way. Antares, a fiery-red star of the first magnitude, gives a light equal to 900 of our suns. *Corona Borealis*, or the Northern Crown, lies to the west of Hercules, and consists of a semicircle of six small stars. *Boötes*, or the Hunter, is a large constellation near the Northern Crown and extending north from the equator. Arcturus, a brilliant star of the first magnitude, is the most notable star in this group. Its light reaches us in 100 years and it is equal in brilliancy to 1,300 of our suns. *Leo*, the Lion, contains a sickle of seven stars, of which Regulus is the most conspicuous. It is at the end of the handle of the sickle and the ecliptic passes very close to it. *Andromeda* is just south of Cassiopeia. It contains the Great Nebula, which is often visible to the naked eye. *Perseus* is in the Milky Way, near Andromeda. It is noted for the star Algol, or the Demon, of varying brightness. *Auriga*, the Charioteer, lies east of Perseus. Its brightest star is Capella, whose light reaches us in 32 years and is equal to 220 of our suns. *Taurus* is noted for the groups, the Hyades, containing the red star Aldebaran, and the Pleiades, forming a small dipper-like group of seven stars, one of which is so faint that it is often spoken of as "lost," though fairly good eyesight may detect it unaided. The brightest star of the Pleiades is Alcyone, whose light reaches us in 267 years and is 250 times brighter than the sun. *Orion* lies across the equator, near Taurus and Auriga. Betelgeuse and Rigel are famous stars in this group; the Belt of Orion is a row of stars; and the Sword of Orion contains the Great Nebula. *Canis Major*, or the Greater Dog, lies southeast of Orion. It contains Sirius, or the Dog Star, one of the stars nearest to us, yet its light takes 8.4 years to reach us, which means that it is 47,000,000,000,000 miles away. *Canis Minor*, or the Lesser Dog, is east of Orion and contains Procyon, a star of the first magnitude. *Gemini*, or the Twins, is just north of Canis Minor. It contains the two stars, Castor and Pollux; both are just a little below the first magnitude.

The Earth.—The earth is in shape an oblate spheroid, *i. e.*, a spherical body bulging at the equator and flattened at the poles. The longest arc actually measured on the earth's surface is that extending from Hammerfest in Norway to the mouth of the Danube River; another, almost as long, from the Himalayas to the southern extremity of India. From these measurements it is concluded that the radius from the center to the surface at the equator is 3,963.296 miles; and the radius at the poles, 3,949.790 miles. The equatorial diameter is nearly 27 miles greater than the polar. The total area of the earth's surface is about 200,000,000 square miles. At latitude 0°, or at the equator, one degree of latitude is 68.704 miles; at 30°, 68.881 miles; at 60°, 69.23 miles; and at 90°, or at the poles, 69.407 miles. At latitude 0°, or at the equator, one degree of longitude measures 69.652 miles; at 30°, 59.955 miles; at 4o°, 53.431 miles; at 60°, 34.914 miles; and at 90°, or at the poles, all the meridians intersect and there is no longitude. The average density of the earth is about 5.5. The interior of the earth is very hot; but the theory that there is only a thin crust surrounding a molten mass is no longer believed by astronomers and physicists. It is now held that the earth is a solid mass; that the temperature within is above the melting point of most bodies at the surface, but, as the melting point increases with the pressure, it is believed that the pressure within the earth is great enough to maintain a solid state. The atmosphere surrounding the earth consists of about 79 per cent. of nitrogen, 21 per cent. of oxygen, about .0003 per cent of carbon dioxide, and very minute quantities of argon, neon, and helium, besides impurities. The atmosphere extends with rapidly decreasing degrees of density to probably a distance of 100 miles from the surface of the earth; but by far the greater part of the atmosphere is within a few miles of the surface. The earth rotates upon its axis and causes the alternation of day and night. As the circumference of the earth at the equator approximates 25,000 miles, and since the earth revolves completely upon its axis in about 24 hours, it follows that any given point on the earth's surface rushes forward from west to east at a rate of about 1,000 miles an hour. The earth revolves around the sun, which revolution defines the year and fixes the seasons. The orbit of the earth, or its path around the sun, is in the shape of an ellipse, but varying very slightly from a perfect circle. As the orbit of the earth measures over 560,000,000 miles, and since the earth moves over this space in one year, it follows that the earth travels around the sun at the rate of about 19 miles a second. This is in addition to the 1,000 miles an hour in its revolution on its axis. Half the length of the major axis of this ellipse is 93,000,000 miles, and this is the mean or average distance of the earth from the sun. When the earth is nearest to the sun, it is said to be in perihelion; when farthest away, in aphelion. In perihelion the earth is 3,000,000 miles nearer to the sun than when in aphelion. The ecliptic is the apparent path of the sun around the earth, and this ecliptic is inclined to the equator at an angle of about 23½ degrees.

The Moon.—The distance of the moon from the earth varies between 221,600 miles and 252,970 miles. The sun is 400 times farther away from the earth than the moon is. The moon rotates upon its axis once in a month. It always keeps the same side towards the earth. We have never seen the other side of the moon. The moon revolves around the earth. Its orbit is an ellipse very closely resembling a circle. When the moon is nearest to the earth, it is in perigee; when farthest away, in apogee. The real diameter of the moon is 2,163 miles, or about 27 per cent. (little more than one quarter) that of the earth. The volume of the moon is about $\frac{1}{50}$ that of the earth. A body weighed by a spring balance on the moon's surface would weigh one sixth of its weight on the earth's surface. The moon has no atmosphere; there is no water on the moon's surface, nor vegetation, nor snow. The surface is rocky, much cracked by extremes of heat and cold, and, maybe, covered in places by volcanic ashes. There are ten mountain ranges; some of the peaks rise over 20,000 feet, as shown by the shadows which the peaks cast. Over 30,000 craters have been mapped, some of which are from 50 to 60 miles in diameter. The surface is further marked by cracks, fissures, or rills, extending in some cases as much as 150 miles long.

Solar System.—The solar system is made up of the sun, the planets and their satellites, the planetoids, the comets, and the meteors. The sun is the center and the entire system is held together by the force of gravitation. The planetoids are small planets and all but one lie between Mars and Jupiter. The comets and the meteors are wandering or perhaps only visiting bodies without regularly defined orbits. In measuring distances between planets, the distance from the earth to the sun—92,897,000 miles—is taken as the unit of measurement. In round numbers the distances of the planets from the sun are:—

Mercury,	36,000,000 miles.
Venus,	67,200,000 miles.
Earth,	92,900,000 miles.
Mars,	141,500,000 miles.
Jupiter,	483,300,000 miles.
Saturn,	886,000,000 miles.
Uranus,	1,781,900,000 miles.
Neptune,	2,791,600,000 miles.
Pluto,	3,700,000,000 miles.

The size of the planets is indicated by the diameters as follows:—

Mercury,	2,765 miles.
Venus,	7,826 miles.
Earth,	7,918 miles.
Mars,	4,352 miles.
Jupiter,	90,190 miles.
Saturn,	76,470 miles.
Uranus,	34,900 miles.
Neptune,	32,900 miles.
Pluto,	10,000 miles.

All of the planets, except Mercury and Venus, have satellites revolving around them. The Earth has the moon; Mars has two moons, each only a few miles in diameter; Jupiter has four large satellites and five very small ones; Saturn has ten satellites, one larger than Mercury and two very small; Uranus has four satellites; and Neptune, one.

Planetoids.—The planetoids known to science number about 500 and are found in the area between Jupiter and Mars. A few of them have diameters of from 100 to 500 miles, but the very great majority are much smaller, even down to 10 miles. Eros is the only planetoid which lies out of the area mentioned; it lies between the Earth and Mars at a mean distance of 135,500,000 miles. It does not exceed 20 miles in diameter.

Comets.—A comet consists of a *head*, a bright *nucleus* within the head, and the *tail* streaming out away from the sun. They are usually very far away from the earth. They vary in size from a head of 10,000 miles in diameter up to 1,000,000 miles; and a tail from a few millions of miles in length up to more than a hundred millions of miles.

Meteors.—Meteors, or "shooting stars," appear at altitudes of from 60 to 100 miles; move over paths of 40 or 50 miles at a rate of from 10 to 40 miles a second. The light is caused by friction with the earth's atmosphere. It is estimated that from 10,000,000 to 20,000,000 touch our atmosphere every day, but only the merest fraction of them are seen. When a number are seen at one time, a "meteoric shower" is said to occur. The greatest showers of meteors occur on November 15, when they seem to emanate from the sickle of Leo, and are thus called Leonides; and on November 24, when they emanate from a point in Andromeda, and are called Andromedes. So long as a meteor is 160,000 miles or over from the earth, it is most attracted by the sun; but within this distance the earth's attraction predominates. The course which the meteors will take under these influences is along the resultant of these two attractions.

Meteorites are bodies weighing from a few pounds up to 1,000 pounds, which fall upon the earth. Only a few are noted each year, but as so much of the earth's surface is covered by water, the meteorites which reach the earth annually may number 100. They are of stone, with iron, either pure or compounded, nickel, and other common chemical elements, totaling about 30.

The Sun.—The sun is one of the millions of stars. It is the source of our light and heat. It gives 600,000 times as much light as the full moon; and over 60,000 times as much as a candle at one yard distance. It is a 60,000 candle power light. If we could harness and utilize all of the energy which the sun gives us in the form of heat, we should have three horse power for every yard of surface exposed to the sun's rays. The temperature of the sun is about 10,000° Fahrenheit. The heat radiated from it would melt a layer of ice 4,000 feet thick over its entire surface every hour. The surface of the sun which we see is called the *photosphere*. Above the photosphere and extending out from 500 to 1,000 miles is the *reversing layer*. Another outside layer from 5,000 to 10,000 miles thick is the *chromosphere*, or the color sphere; it forms a brilliant scarlet fringe seen during an eclipse. The outermost portion is called the *corona*, or crown, of a pearly light visible only during an eclipse and extending outward from 200,000 to 300,000 miles, with some streamers stretching out over 5,000,000 miles. *Sun spots* are darker bodies, or spots on the photosphere, and may endure for a few days or for several months. The shadow, or *umbra*, of a sun spot may be anywhere from 500 to 50,000 miles across; the *penumbra*, or less dark belt, may be 200,000 miles across. One one-hundredth of the sun's entire surface may be involved at one time. The larger sun spots are easily visible through smoked glass or even by the naked eye when the sun is setting or rising. Galileo discovered sun spots in 1610. They have been the object of superstitious fear, and even in the present day attempts have been made to associate climatic disturbances with the occurrence of large sun spots. The sun rotates on its axis once in about 25 days.

Eclipses.—An eclipse of the moon is caused by the moon entering the shadow of the earth, or, in other words, by the earth passing between the sun and the moon. An eclipse of the sun is caused by the moon passing between us and the sun. And these eclipses may be total or partial. When the planet Venus, which is the next one between us and the sun, passes between us and the sun, we speak of that passage of the shadow across the sun's disc as a *transit*, not as an eclipse. Eclipses may be predicted, because of a law of recurrence known from ancient times. The sun and moon return to the same positions after a period of 6,585 days and 8 hours, or 18 years, 12 days, 8 hours. This period is called the *saros;* and eclipses of every sort repeat themselves at the end of every saros. The eclipses in 1900 were a repetition of those of 1882, 1864, 1846, 1828, and so on. On account of the eight hours during which the sun goes one third around the earth, the same portion of the earth is not exposed to the eclipse, and so every eclipse is not visible at the same places as in its previous occurrence. There will not be another transit of Venus until the year 2004 and again in 2012.

Seasons.—The causes of the regular changes of conditions known as the seasons are the passage of the earth around the sun and the inclination of the earth's axis to the plane of its orbit. As the orbit of the earth is elliptical, one axis is longer than the other, so that the earth is not always at the same distance from the sun. As the axis of the earth is inclined to the plane of its orbit at an angle of 23½ degrees, the same part of the earth is not always inclined to the sun, and the sun's rays are not always perpendicular over the same place on the earth. In the season known to us as spring the sun's rays fall perpendicularly upon the equator; day and night are equal all over the earth; and the event is known as the vernal equinox, March 21. In midsummer, June 21, the sun's rays fall perpendicularly upon the tropic of Cancer; the northern hemisphere experiences its longest day, and the event is called the summer solstice because the sun appears to remain stationary on the ecliptic for a day or two before going south again. In autumn, September 21, the sun's rays fall perpendicularly at the equator; days and nights are equal all over the earth, and the event is called the autumnal equinox. In winter, December 21, the sun's rays fall perpendicularly upon the earth at the tropic of Capricorn; the day is shortest in the northern hemisphere and longest in the southern; the event is known as the winter solstice.

PHYSIOGRAPHY.

The Earth's Surface.—The division of the earth into land and water surface is slightly more than one fourth land, and slightly less than three fourths water, estimated as follows:—

Land Surface.

	Sq. Miles.		Sq. Miles.
Africa	11,317,277	Australasia	3,459,561
North America	15,418,662	Europe	3,875,670
South America		Polar regions	4,190,323
Asia	16,878,507		
		Total	55,640,000

Largest Islands in the World.

	Area Sq. Miles	Population
Greenland	825,000	14,355
New Guinea	321,232	822,348
Borneo	237,916	2,072,100
Madagascar	228,000	3,613,341
Japan	148,756	55,961,140
Sumatra	163,138	5,852,135
Great Britain	89,045	42,767,530
Celebes	72,679	3,108,337
New Zealand (South Island)	58,120	477,658
Java and Madura	52,327	36,860,805
New Zealand (North Island)	44,130	741,255
Cuba	44,164	2,889,004
Newfoundland	42,734	259,358
Philippines	114,400	10,350,330
Iceland	39,709	94,679
Ireland	32,586	4,390,219
Jesso (Yezo)	30,340	843,000
Saghalin	24,560	140,000
Haiti	29,536	3,500,000
Tasmania	26,215	213,877
Ceylon	25,331	4,504,549
Tierra del Fuego	19,299	2,500

Water Surface.

	Sq. Miles.		Sq. Miles.
Atlantic Ocean	34,700,000	Arctic Ocean	4,470,000
Pacific Ocean	67,570,000	Antarctic Ocean	5,610,000
Indian Ocean	28,900,000	Estimated area	141,250,000

Including inland seas and other waters, it is estimated that the total water surface of the globe exceeds 143,000,000 square miles.

Areas, Depths, and Heights of Great Lakes.

Lakes.	Length Miles.	Width Miles.	Max. Depth Feet.	Height above Sea (feet).	Area Square Miles.
Erie	240	30-58	200	573	9,960

Relief Features of the Land.—Continents are made up of plains, plateaus, and mountains. *Plains* are coastal and interior. A good example of coastal plains are those on the Atlantic coast south of New York, and upon the Gulf coast. Interior plains are such as the Upper Mississippi plains and the Great Plains west of the Mississippi. Examples of *plateaus* are to be found just west of the Appalachian Mountains, where the Alleghany Plateau is formed; just north of the Wachita Mountains, where the Ozark Plateau is seen; the Great Plateau east of the Rocky Mountains, and the Lava Plateau, Basin Range Plateau, and Colorado Plateau, west of the Rocky Mountains. Plains are the most habitable parts of a country. In the United States three fifths of the population live at an altitude of 100 to 1,000 feet; one fiftieth, about 2,000 feet. The loftiest plateau in the world is the Plateau of Tibet, 15,000 to 16,000 feet high; one of the most picturesque is in northern Arizona, 7,000 feet high, containing the Grand Cañon of the Colorado, a mile deep.

PRINCIPAL RIVERS OF THE UNITED STATES.

(Most of these rivers are navigable for a part of their length.)

Alabama, junc. of Coosa and Tallapoosa rivers, Ala., to Mobile river, 350 m.
Alleghany, near Raymond, Pa., to Ohio river, 350 m.
Androscoggin, Umbagog lake, Me., to Kennebec river, 160 m.
Apalachicola, junc. of Chattahoochee and Flint rivers, Ga., to Gulf of Mexico, 90 m.
Arkansas, Rocky mtns., Colo., to Mississippi river, 2,000 m.
Big Horn, Rocky mtns, Wyo., to Yellowstone river, 500 m.
Black Warrior, formed by Locust and Mulberry forks, Ala., to Tombigbee river, 300 m.
Brazos, in the Staked Plain, Tex., to Gulf of Mexico, 850 m.
Canadian, northeastern New Mexico to Arkansas river, 900 m.
Cape Fear, junc. of Haw and Deep rivers, N. C., to the Atlantic, 250 m.
Chattahoochee, in Habersham county, Ga., to Apalachicola river, 500 m.
Cheyenne, eastern Wyoming to Missouri river, 500 m.
Cimarron, Raton mtns., N. Mex., to Arkansas river, 650 m.
Colorado, in the Staked Plain, Tex., to Matagorda bay, 650 m.
Colorado, junc. of Green and Grand rivers, Utah, to Gulf of California, 1,360 m.
Columbia, upper Columbia lake, B. C., to the Pacific, 1,400 m.
Connecticut, Connecticut lake, N. H., to L. I. sound, 410 m.
Coosa, junc. of Oostenaula and Etowah rivers, Ga., to Alabama river, 350 m.
Cumberland, junc. of Poor and Straight forks, Ky., to Ohio river, 650 m.
Delaware, Catskill mtns., N. Y., to Delaware bay, 375 m.
Des Moines, Lake Shetek, Minn., to Mississippi river, 450 m.
Dolores, San Juan mtns, Colo., to Grand river, 250 m.
Flint, near Atlanta, Ga., to Apalachicola river, 350 m.
Fox, Green Lake county, Wis., to Green bay, 250 m.
Genesee, near Raymond, Pa., to Lake Ontario, 145 m.
Gila, Tuscan mtns., N. Mex., to Colorado river, 550 m.
Grand, Hillsdale county, Mich., to Lake Michigan, 280 m.
Grand, Grand lake, Colo., to Green river, 350 m.
Great Kanawha, Blue Ridge mtns., N. C., to Ohio river, 450 m.
Green, Lincoln county, Ky., to Ohio river, 350 m.
Gunnison, Saguache range, Colo., to Grand river, 200 m.
Hudson, Lake Sanford, Adirondacks, to New York bay, 350 m.
Housatonic, Taghanic mts., Mass., to Long Island sound, 150 m.
Humboldt, Elko county, Nev., to Humboldt lake, 375 m.
Illinois, Des Plaines river, Wis., to Mississippi river, 435 m.
James, formed by Jackson's and Cowpasture rivers, Va., to Chesapeake bay, 450 m.
Kalamazoo, Hillsdale co., Mich., to Lake Michigan, 200 m.
Kansas, junc. of Smoky Hill fork and Solomon river, Kan., to Missouri river, 300 m.
Kaskaskia, Champaign co., Ill., to Mississippi river, 320 m.
Kennebec, Moosehead lake, Me., to the Atlantic, 175 m.
Kentucky, Cumberland mtns., Ky., to Ohio river, 250 m.
Menominee, junc. Brule and Michigamie rivers, Mich., to Green bay, 125 m.
Merrimac, White mtns., N. H., to the Atlantic, 150 m.
Minnesota, Big Stone lake, S. Dak., to Mississippi river, 475 m.
Missouri-Mississippi, Rocky mtns., Mont., and Itasca lake, Minn., to Gulf of Mexico, 4,200 m.
Mobile, junc. of Tombigbee and Alabama rivers, Ala., to Mobile bay, 50 m.
Mohawk, Lewis county, N. Y., to Hudson river, 160 m.
Monongahela, formed by West Fork and Tygart's Valley rivers, W. Va., to Alleghany river, 300 m.
Neosho, Morris county, Kan., to Arkansas river, 400 m.
Neuse, Person county, N. C., to Pamlico sound, 300 m.
Ohio, junc. of Alleghany and Monongahela rivers, Pa., to Mississippi river, 950 m.
Osage, Lyon county, Kan., to Missouri river, 460 m.
Passaic, Morris county, N. J., to Newark bay, 100 m.
Pearl, Winston county, Miss., to Gulf of Mexico, 350 m.
Pecos, Rocky mtns., N. Mex., to Rio Grande river, 800 m.
Pedee, Blue Ridge mtns., N. C., to Winyaw bay, S. C., 300 m.
Penobscot, Somerset county, Me., to Penobscot bay, 350 m.
Platte, Sweetwater river, Wyo., to Missouri river, 1,260 m.
Powder, Big Horn mtns., Wyo., to Yellowstone river, 400 m.
Potomac, Alleghanies, W. Va., to Chesapeake bay, 450 m.
Red, in the Staked Plain, Tex., to Mississippi river, 1,200 m.
Red (of North), Lake Traverse, Minn., to Lake Winnipeg, 700 m.
Rio Grande, San Juan mtns., Colo., to Gulf of Mexico, 1,800 m.
Roanoke, formed by Dan and Staunton rivers, Va., to Albemarle sound, 240 m.
Rock, Koshkonong lake, Wis., to Mississippi river, 330 m.
Sabine, northern Texas to Gulf of Mexico, 460 m.
Sacramento, Goose lake, Cal., to Suisun bay, 600 m.
St. Croix, Douglas and Bayfield counties, Wis., to Mississippi river, 200 m.
St. Francis, St. Francois co., Mo., to Mississippi river, 460 m.
St. John's, e. Florida, flows n. to the Atlantic, 400 m.
St. Joseph, Hillsdale county, Mich., to Lake Michigan, 260 m.
San Joaquin, Sierra Nevada mtns., Cal., to Sacramento river, 350 m.
Santee, junc. of Wateree and Congaree rivers, S. C., to the Atlantic, 150 m.
Savannah, formed by Tugaloo and Kiowee rivers, S. C., to the Atlantic, 450 m.
Schuylkill, near Pottsville, Pa., to Delaware river, 130 m.
Scioto, Auglaize county, Ohio, to Ohio river, 225 m.
Shenandoah, Northern Virginia to Potomac river, 200 m.
Snake, Yellowstone Nat. Park, Wyo., to Columbia river, 950 m.
Susquehanna, north or east branch, Lake Schuyler and Otsego lake, N. Y., to Chesapeake bay, 256 m.
Susquehanna, west branch, near Raymond, Pa., to Susquehanna river, 250 m.
Suwanee, Okefinokee swamp, Ga., to Gulf of Mexico, 200 m.
Tallahatchee, northern Mississippi to Yazoo river, 240 m.
Tallapoosa, Paulding county, Ga., to Coosa river, 250 m.
Tennessee, formed by French Broad and Holston rivers, Tenn., to Ohio river 1,200 m.
Tombigbee, Prentiss county, Miss., to Mobile river, 475 m.
Trinity, northern Texas to Galveston bay, 530 m.
Wabash, Mercer county, Ohio, to Ohio river, 550 m.
Washita, western Arkansas, to Red river, 550 m.
White, northwestern Arkansas to Mississippi river, 800 m.
Willamette, Cascade range, Ore., to Columbia river, 275 m.
Wisconsin, northern Wisconsin to Mississippi river, 400 m.
Yazoo, junc. of Tallahatchee and Yalobusha rivers, Miss., to Mississippi river, 300 m.
Yellowstone, Rocky mtns., Wyo., to Missouri river, 1,100 m.

PRINCIPAL FOREIGN RIVERS.

(Most of these rivers are navigable for a part of their length.)

Amazon, S. America, Peruvian Andes to Atlantic, 3,900 m.
Amu-Darya, Turkestan, Pamir plateau to Aral sea, 1,500 m.
Amur, Siberia, w. of Kingans to Gulf of Tartary, 2,600 m.
Brahmaputra, India, Tibet to Bay of Bengal, 1,680 m.
Danube, c. and s. e. Europe, junc. headwaters near Black Forest to Black sea, 1,725 m.
Darling, Australia, Vic. and N.S. Wales to Murray river, 1,160 m.
Dnieper, Russia, Smolensk to Black sea, 1,400 m.
Dniester, Austria and Russia, Carpathians to Black sea, 800 m.
Elbe, Germany, Riesengebirge to North sea, 700 m.
Euphrates, Asiatic Turkey, flows into Persian gulf, 1,700 m.
Gambia, w. Africa, Futa-Jallon w. to the Atlantic, 500 m.
Ganges, India, Hurdwar to Bay of Bengal, 1,500 m.
Garonne, France, Pyrenees n. w. to Bay of Biscay, 385 m.
Hoang-ho, n. China, Kokonor to Gulf of Pechili, 2,600 m.
Indus, Asia, Himalaya mtns., Tibet, to Arabian sea, 2,000 m.
Irawadi, Burma, n. e. of Assam to Bay of Bengal, 1,250 m.
Kongo, c. and w. Africa, 3,000 m.
La Plata, S. America, junc. of Paraná and Uruguay rivers, with Paraná to the Atlantic, 2,300 m.
Lena, Siberia, Baikul mtns. to Arctic ocean, 2,800 m.
Loire, France, Gerbier-des-Joncs to Bay of Biscay, 650 m.
Mackenzie, Canada, Gt. Slave lake to Beaufort sea, 2,300 m.
Madeira, S. America, including the Mamoré, 2,000 m.
Magdalena, Colombia, Ecuador to Caribbean sea, 950 m.
Marne, France, enters the Seine near Paris, 310 m.
Maros, Hungary, Carpathian mtns. to the Theiss, 500 m.
Mekong, s. e. Asia, Tibet to China sea, 2,600 m.
Meuse, France, dept. Haute-Marne to North sea, 575 m.
Murray, Australia, junc. headwaters to Indian ocean, 1,450 m.
Niger, w. Africa, Sudan n. w. of Sierra Leone to Gulf of Guinea, 2,900 m.
Nile, Africa, Victoria Nyanza to Mediterranean, 3,766 m.
Ob, Siberia, Little Altai mtns. to Ob gulf, 2,300 m.
Oder, Germany, Carpathians to Baltic sea, 550 m.
Orange, s. Africa, Drakenberg to the Atlantic, 1,100 m.
Orinoco, S. America, s. Venezuela to the Atlantic, 1,600 m.
Paraguay, Brazil, Matto Grosso state to Paraná river, 1,500 m.
Paraná, Brazil, Minas Geraes state to the Atlantic, 2,450 m.
Po, n. Italy, Monte Viso to Adriatic sea, 420 m.
Rhine, Europe, Switzerland to North sea, 700 m.
Rhone, France and Switzerland to Gulf of Lyons, 500 m.
Rio Negro, Colombia, joins Amazon in Brazil, 1,400 m.
Rio Teodoro, Brazil, to Madeira river, 950 m.
St. John, Maine and New Brunswick, Bay of Fundy, 550 m.
St. Lawrence, Lake Ontario to Gulf of St. Lawrence, 2,150 m.
Salwin, Burma, Tibet to Martaban gulf, 1,750 m.
São Francisco, Brazil, Minas Geraes state to Atlantic, 1,200 m.
Saskatchewan, Canadian Rockies to Lake Winnipeg, 1,100 m.
Seine, France, Côte d'Or to English channel, 475 m.
Shannon, Ireland, Cuilcagh mtns. to the Atlantic, 250 m.
Tagus, Spain and Portugal, flows into the Atlantic, 550 m.
Thames, England, junc. of headwaters to North sea, 215 m.
Theiss, Hungary, Carpathian mtns. to the Danube, 800 m.
Tigris, Asiatic Turkey, unites with Euphrates, 1,150 m.
Ural, between Europe and Asia, to Caspian sea, 1,400 m.
Vistula, Europe, Carpathians to Baltic sea.
Volga, European Russia Tver govt. to Caspian sea, 2,300 m.
Weser, Germany, Münden to North sea, 300 m.
Yangtze, China, northern Tibet to Yellow sea, 3,400 m.
Yenesei, Mongolia and Siberia to Arctic ocean, 3,300 m.
Yukon, Lake Lindeman, Canada, to Bering sea, 2,200 m.
Zambezi, e. Africa to Indian ocean, 1,600 m.

Atmospheric Forces.—The forces exerted by the atmosphere are those of the wind and chemical forces. The atmosphere is everywhere laden with *dust*—on mountain tops, over the ocean, and over the ice fields of the polar regions. The microscope shows that atmospheric dust is composed of grains of pollen from plants, bits of vegetable fiber, hairs, mineral and rock fragments, metallic iron, fungi, bacteria, and disease germs. Dust particles in the air reflect sunlight into shady places; without them all shady places would be black. They soften direct sunlight; for without them the sun would be of dazzling brightness, shining out of a black sky in which the stars would be visible in daytime. They cause or affect the blueness of the sky and the glorious tints of the sky at sunrise and sunset. Water vapor in the air coats the particles of dust, and condensation, causing clouds and rain, follows. Dust, then, is an important, though not a necessary, factor in rain-making. Volcanic dust is thrown into the atmosphere and widely distributed over the world during volcanic eruptions. After the eruption of Soufrière, in the island of Martinique, in 1902, a layer of volcanic dust from five to six feet deep was deposited five miles distant; and it is estimated that some of this dust was in the air for three years and went several times around the earth before settling.

Loess is a dust-like earthy material, the grains of which are smaller than those of sand, but larger than those of clay. These are carried by the wind, and are capable of compacting and forming bluff-like mounds of great solidity. They are to be found in China, Europe, and in many parts of the Mississippi basin. The two most marked *chemical effects* of the air are oxidation and carbonation. *Oxidation* is the effect of the oxygen of the air upon many substances in rocks, most notably upon iron. This rusts or hydrates, and the rocks crumble away. *Carbonation* is caused by the action of the carbon dioxide or carbonic acid gas in the air which unites with some constituents of rocks and causes them to crumble. These are potent forces in the weathering of rocks which make large and valuable contributions to soils. *Freezing* and *thawing*, due to changes in the temperature of the air, are important atmospheric forces. The expansion of frozen water in cracks of rocks acts as a powerful wedge which in time drives the parts asunder and breaks the rocks in pieces. Even the contraction and expansion of rocks under the great ranges of temperature of the air, heated by day and cooled at night, has a similar effect. Masses of rocks on slopes, slightly covered by layers of loose material, gradually peel off under this effect, and, though the process is slow, the cumulative effect of slight changes upon large areas is very great. Roots of plants penetrating crevices in rocks accomplish the same results; and the genus of plants known as the Saxifrage (rock-breakers) exerts a wonderful effect for such slight and delicate agents. Trees growing in crevices of rocks are not of infrequent occurrence. In time their roots bring about important changes in the rocks into which their roots penetrate. The mass of rocks and loosened soil torn up by the roots of trees blown down by heavy winds are also contributory to the same results.

Water Forces.—The effects of water upon the land are seen after heavy falls of rain, rapid melting of snow, and the consequent filling of streams, and in the force of waves from lakes and seas. The average rainfall the world over is about 40 inches a year. In computing the rainfall, from 10 to 12 inches of snow are regarded as equivalent to one inch of rain. If this quantity of water fell at one time it would be sufficient to cover the surface of the land with more than three feet of water. The rainfall varies in different parts of the world.

Ground Water.—Forty inches of rainfall over the whole land equals about 35,000 cubic miles of water in a year. Only about 6,500 cubic miles of this is emptied into the sea by rivers. Part of the remainder sinks into the soil, depending upon the porosity of the earth upon which it falls; part lodges in lakes and pools upon the surface; part runs off the soil; and part is evaporated. That part which soaks into the soil is ground water. It is thought that the water which soaks into the earth does not penetrate deeper than five or six miles. Ground water is not evenly distributed throughout the soil; for in some localities water in well-digging is found in sufficiently large quantities at only a few feet, while in other places it is necessary to bore down hundreds or even thousands of feet before a supply of water can be procured. St. Louis has an artesian well over 4,000 feet deep; Berlin has one the same depth; one in Cincinnati is about 2,500 feet; Chicago has one about 2,700 feet; and there are many over 1,000 feet deep. Ground water is constantly moving, upon the theory that water seeks its own level, but ground water never attains it, because of the added supply which rain constantly brings. Part of the ground water flows into wells or springs; part flows underground into lakes and ponds; part is drawn up by the capillarity of cultivated soil and feeds the roots of plants and trees; and part escapes from the soil by invisible evaporation. When ground water forms a spring, it often passes through soil and rocks which contain substances which are capable of being dissolved by it. In this way salt, mineral, and medicinal springs are formed. When the water has reached considerable depths and has come in contact with hot rocks, a hot spring may be formed, such as the Hot Springs of Arkansas, South Dakota, and Carlsbad in Bohemia. When the hot water is forced out of the spring at intervals a geyser is formed. The most celebrated is the Great Geyser of Iceland. It consists of an immense well, or funnel, 10 feet wide at its mouth, and about 70 feet deep, surmounted at the surface with a basin 65 feet in diameter and 7 feet deep, formed by the deposit of mineral matter from the water. At intervals it sends up a column of water and steam to the height of 100 feet. More remarkable even than the geysers of Iceland are some that are found in the "National Park." One, the Giantess, throws water to the height of 200 feet. Another is known as "Old Faithful," because it discharges its waters regularly once an hour. Grasshoppers and other insects, and pieces of wood which fall into the waters, soon become incrusted with quartz, which is held in solution by the water, thus permanently petrifying them.

Ground water in its passage through the soil dissolves out of the rocks and soil many mineral substances and disintegrates the structure, forming caves after long periods.

The Mammoth Cave is situated in Edmondson County, near Green River, Kentucky, and extends some nine miles. It contains a succession of wonderful avenues, chambers, domes, abysses, grottoes, lakes, rivers, and cataracts. One chamber, the Star, is about 500 feet long, 70 feet wide, and 70 feet high; the ceiling is composed of black gypsum, and is studded with innumerable white points, that by a dim light resemble stars; hence the name. There are avenues one and a half and even two miles in length, some of which are incrusted with beautiful formations, and present a most dazzling appearance. There is a natural tunnel about three quarters of a mile long, 100 feet wide, covered with a ceiling of smooth rock, 45 feet high. Echo River is some three fourths of a mile in length, 200 feet in width at some points, and from 10 to 30 feet in depth, and runs beneath an arched ceiling of smooth rock about 15 feet high; while the Styx, another river, is 450 feet long, from 15 to 40 feet wide, and from 30 to 40 feet deep, and is spanned by a natural bridge. Lake Lethe has about the same length and width as the river Styx, varies in depth from 3 to 40 feet, lies beneath a ceiling some 90 feet above its surface, and sometimes rises to a height of 60 feet. There is also a Dead Sea. The entrance to the cave is reached by passing down a wild, rocky ravine through a dense forest. To visit the portions of this wonderful cave already traversed requires, it is said, 150 to 200 miles of travel.

Carlsbad Caverns in New Mexico, first explored in 1924, are to date the largest known caves in the world. The greatest room is 1,125 feet wide, 350 high, and the total space is 25 times larger than any room in Mammoth Cave. There are many miles of passages, numerous rooms, fountains of rocks that look like frozen Niagaras, ice chambers like delicate lace, and zoological specimens of rare interest. Streams, glaciers, stone lily pads, totem poles and cacti are among the many strange formations. The temperature remains stationary at 56°. Wonderfully colored crystals abound.

Wyandotte Cave and others in southern Indiana, and Luray Cave and others in Virginia, are of similar origin. Some of the solid matter forms bodies, like icicles, called stalactites when they hang from the ceilings, and stalagmites when they rise up from the ground. In the same way crystals form upon the walls. When water carrying mineral matter held in suspension flows into cracks of rocks, these cracks become filled in time with the mineral matter, and veins are formed which often carry gold, silver, and other ores. When ground water charged with solutions of mineral matter falls upon trunks of trees and other vegetable matter, the mineral matter is deposited and takes the place of the vegetable matter as it decays, and in this way petrifaction takes place. The mechanical burrowing under the soil by ground water often results in landslides where great masses of land slide down from sloping positions, burying other regions under the mass and often destroying life and property.

Great Floods and Inundations.—Year 353. Cheshire, England; 3000 drowned.
758. Glasgow; 400 families perished.
1219. Nordland, Norway; 36,000 by lake-burst.
1521. Holland dikes gave way; 100,000 drowned.
1642. Kaifong, China, 300,000 by Yellow River.
1646. Holland and Friesland, 110,000.
1813. Silesia, 6000 drowned; 4000 in Poland.
1825. One-third of Friesland, Denmark submerged; north Jutland made an island.
1833. Canton, China, 1000 dead; and hundreds elsewhere in river valleys.
1840. In France, 60,000 acres flooded.
1849. In New Orleans, 1600 houses flooded.
1874. Williamsburg, Mass., 143 dead; in western Pennsylvania, 220.
1875. Toulouse, France, covered by Rhone; 1000 deaths.
1876. In Ganges delta, India, 150,000 drowned by tidal waves.
1879. Murcia, Spain, 2000 houses and 1000 people destroyed.
1887. Hwang-Ho, China, drowned millions.
1889. Johnstown, Pa., swept by bursting reservoir; 7 other villages razed; 2,209 killed.
1896. In Japan earthquake wave drowned 27,000 and made 60,000 homeless.
1900. Galveston, Texas, flooded by waves, with 7000 drowned, and loss of $30,000,000.
1910. Seine flooded a fourth of Paris; damage $200,000,000; 250,000 homeless.
1911. China, 100,000 drowned by Yang-tse, which made new lake, 50 by 35 miles.
1913. Ohio and Indiana flooded; 400 dead in Miami Valley; 730 in all; loss $100,000,000.
1927. Mississippi River flooded 28,573 square miles; greatest of 30 major floods since 1785; about 200 dead; other great floods in 1844, 1858, 1882, 1903, 1912, 1913, 1922.
1931. In China 2000 sq. miles covered, 150,000 killed; loss, $200,000,000.
1932. In Manchuria, 30,000; $100,000,000.
1935. Hurricane, Fla., high waters in New York, New England, Pennsylvania, and Nebraska drowned 300; damage, $50,000,000; 90,000 on relief.
1936. Even greater damage in Ohio, Connecticut, Potomac, and Merrimac valleys.
1937. Greatest Ohio River flood; 1,000,000 homeless; 500 dead; $300,000,000 loss.

The Mississippi carries half a billion tons of solid earth into the Gulf of Mexico every year. In 1875 Eads made jetties to narrow the river bed, and so to cause the current to wash out all loose material. Recently, by dredging and building up the levees even better results have been obtained. In China a modified Eads method has tended to keep the Hwang-Ho or Yellow River ("The Sorrow of China") within banks, but millions in past history have been drowned by frequent floods of this and the Yang-tse.

The Great Waterfalls.—Waterfalls are formed by a current of water passing rapidly from a higher to a lower level. They are found most frequently in mountainous regions where many streams from the mountain sides unite in the valley. They change their appearance from year to year owing to erosion or the wearing

away of the rocks. Among the highest waterfalls are the following:—

Yosemite (3 plunges)	2660 feet.
Oroco Falls of Monte Rosa	2400
Roraima Fall, Guiana (2 plunges)	2000
Grand Falls of Labrador	2000
Sutherland Falls, New Zealand (3 plunges)	1904
Kukenam Fall, Guiana (sheer plunge)	1500
Gavarnie Fall, Pyrenees	1400
Krimmler Falls, Austria	1300
Staubbach, Switzerland	1000
Vermafos, Norway	984
Maanelvan, Norway	940
Bridal Veil, California (with cascades)	900
Vettisfos, Norway	853
Rjukanfos, Norway	804
Kaieteur Falls, Guiana	740
Skykjefos, Norway	700
Nevada Fall, California	600
Velino Falls, Italy (3 plunges)	591
Tessa Falls, Austria (3 plunges)	541
Vöringsfos, Norway	520
Rukaufos, Norway	513
Great Falls, Montana	500
Tequendama, Colombia	475
Gastein Falls, Austria	469
Victoria Falls, Zambesi	400
Shoshone, Idaho	210
Foyers, highest in Britain (2 plunges)	205
Hay River, Alaska	200
Niagara	165

It is estimated that Niagara Falls has a force of about 4,000,000 horse power. In the wearing away it is estimated that Niagara Falls has receded about 7 miles. Estimates have been made of the rate at which it is now receding, and of the time when there will be no falls. But that is what every waterfall is tending to, for all rivers will one day reach a base level. In the work of erosion there are many instances where a mass of rock harder than its fellows has withstood the ravages to which they have yielded. Such masses of rock standing alone as hills or even mountains, are called "monadnocks." When it takes the form of a long, narrow ridge it is called by some a "hog back." In the West these are called "buttes." When flat-topped and table-like, it is a "mesa."

Snow and Ice.—The snow-line on mountains varies with the latitude of the place, being higher at the equator and lower as the poles are approached. Near the equator the snow-line is about 18,000 feet above the sea-level. On the north side of the Himalayas, facing the plateau of Tibet, it is at 19,500 feet. In the Caucasus and in the Rocky Mountains it is about 11,000 feet. In the Alps it is between 7,500 and 9,000 feet. In Iceland, on the Arctic Circle, it is about 3,000 feet. In Spitzenberg it is almost at the sea-level. Snow is seldom known to fall between north and south latitudes of 33°. It is estimated that the total amount of snow and ice on the land amounts to 1,000,000 cubic miles, which, if melted, would raise the sea-level over 30 feet. Glaciers are heavy and compacted snow-fields which creep out of their positions, move down slopes, or spread in all directions if the surface upon which they rest is level. When a glacier cracks open, a crevasse is formed. Great masses of stone and earth are carried by glaciers. This transported matter is called glacier débris. Flat rocks prevent the sun's rays from melting the ice directly under them, and a column of ice remains supporting the stones, giving the whole the appearance of a huge toadstool. As the glacier creeps along and is melted or wasted by the sun's rays at one end, it is being constantly fed or replenished by the snow-fields at the other. The creeping motion of the glacier has been measured by planting rows of stakes along its lower margin. It has been found that the rate of descent of most glaciers is about a foot or two a day, though one huge glacier in Iceland moved over 100 feet a day. Glaciers are numerous in the Alps, where more than 2,000 are known, the longest being 10 miles long and the greater number less than a mile long. In the Caucasus Mountains, the Himalayas, Greenland, and especially in Alaska and Canada, glaciers abound. South of Canada the glaciers are of much less size. Greenland, with its area of from 400,000 to 600,000 miles, is one vast ice field, except on its borders. From these and similar ice formations, great masses break off and float away as icebergs. The great force of glaciers is seen in the polishing, grinding, and powdering effect upon rocks, as well as the transportation of bowlders, stones, and gravel.

Volcanoes.—A volcano is a vent in the earth's crust through which liquid rock or lava and solid rock are emitted. As the material gathers, a cone is formed around the opening or crater. Among active volcanoes the best known are Stromboli, on a small island north of Sicily, about one mile high, and in constant activity; Vesuvius, 4,000 feet high, on the Bay of Naples, disastrously active in the spring of 1906; Krakatoa, in the Strait of Sunda between Java and Sumatra, whose eruption in 1883 caused the death of 36,000 persons and the destruction of 295 villages; Mont Pelée, in Martinique, which in the eruption of 1902 destroyed 30,000 persons; Soufrière, on the island of St. Vincent, in a sympathetic eruption on May 7 of 1902, caused the death of 1,350 persons; Mauna Loa and Kilauea, in Hawaii. Many of the lofty mountains of the globe are of volcanic origin. Among these are Mt. Shasta, in northern California; Mt. Rainier, in Washington; and Mt. Hood, in the Cascade Range. Hardened lava assumes many forms, such as the basaltic columnar structure of the Giant's Causeway.

The name Giant's Causeway is often applied to the entire range of cliffs in the County Antrim, on the northeast coast of Ireland, but it properly belongs to only a small portion of them, which is a platform of basalt in closely arranged columns, from 15 to 36 feet high, which extends from a steep cliff down into the sea till it is lost below low water mark. This platform is divided across its breadth into three portions, the Little, Middle, and Grand Causeway, these being separated from each other by dikes of basalt. The columns are generally hexagonal prisms, but they are also found of five, seven, eight, and nine sides, in almost every instance being fitted together with the utmost precision, even so that water cannot penetrate between adjoining columns. The name "causeway" was given to the platform because it appeared to primitive imagination to be a road to the water, prepared for giants.

Earthquakes.—The general opinion of investigators is that these agitations proceed from within outward, and are not of atmospheric or other external origin. True, Professor Alexis Perry, of Dijon, France, thought he discovered relations between the ages of the moon and these occurrences which seemed to sustain the theory of Zantedeschi that the liquid nucleus of the earth responds to the moon's attraction in tides,

ALASKAN CONTRASTS—II

1 Gold prospectors' camp, Chilkoot Pass. 2 Strawberries growing in summer in Haines, Chilkoot District. 3 Flowers backed by snowy hills, Skagway. 4 Winter transportation by dog teams, Nome.

but the theory that the earth has a liquid nucleus covered with only a thin, solid crust is losing adherents continually. Mr. Robert Mallet, one of the foremost investigators of seismic phenomena, in an elaborate report on the subject presented to the British Association, proposed an ingenious theory. He assumes that volcanoes and the centers of earthquake disturbances are near the sea or other large supplies of water; and he says that when an eruption of igneous matter takes place beneath the sea-bottom the first action must be to open up large fissures in its rocky material, or to lift and remove its incoherent portions, such as sand, mud, gravel, etc. The water, on meeting the heated surface, assumes the spheroidal state. While in this condition the intestine motion may be great, but little steam is generated; but no sooner have the surfaces cooled than the water comes into close contact with them, and a vast volume of steam is evolved explosively and blown off into the deep and cold water of the sea, where it is condensed, and thus a blow of the most tremendous sort is given at the volcanic focus, and, being transferred outwardly in all directions, is transmitted as the earthquake shock. Whatever their origin, whether of one cause or various causes, the prevailing opinion still is that the vibrations of every earthquake can be traced to a focus within the earth, and that this lies directly beneath the point of greatest disturbance on the earth's surface. This center of impulse, or, as it is termed, the "seismic focus," is not an exact mathematical point, but may measure many miles in diameter.

It is only within the last 60 years that the phenomena of earthquakes have been subjected to exact investigation, and a new science has been created, known as *seismology* (σεισμός, an earthquake). Special instruments called seismometers and seismographs have been designed for the purpose of recording the direction and intensity of the disturbances.

We now learn that earthquakes are much more frequent than was formerly supposed. There are, for instance, official records of 8,331 earthquakes in Japan between the years 1885 and 1892; that is, an average of over 1,000 shocks a year. Seismologists have further discovered that, although volcanic and seismic disturbances may take place side by side, the direct relationship between them is extremely rare. Speaking generally, it is found that earthquakes are more frequent along the steeper flexures in the earth's surface, and in those localities where geological conditions show that the secular movements of the earth's crust are still in progress. These conclusions would indicate that the origin of many earthquakes is connected with rock folding. Such movements, including upheavals, subsidences, and horizontal displacements, are termed bradyseismical (βραδύς, slow) movements.

Great Earthquakes.

425 B. C.—One which made Euboea an island.
345 B. C.—Duras in Greece and 12 cities in Campania buried.
17.—Ephesus and other cities demolished.
79.—One accompanying the eruption of Vesuvius and destruction of Herculaneum and Pompeii.
115.—Antioch destroyed.
157.—One hundred and fifty towns wrecked in Asia Minor and Macedonia.
557.—Thousands perished at Constantinople.
742.—In Syria, Palestine, and Asia Minor. Immense loss of life.
936.—Constantinople desolated; all Greece shaken.
1137.—In Catania, Sicily; 15,000 perished.
1158.—In Syria, etc.; 20,000 perished.
1268.—In Cilicia; 60,000 perished.
1318.—Greatest earthquake known in England.
1456.—At Naples; 40,000 perished.
1531.—At Lisbon; 30,000 buried.
1626.—In Naples; 70,000 perished.
1693.—In Sicily; 354 cities, towns, and villages destroyed. More than 100,000 perished.
1703.—In Jeddo (now Tokyo), Japan; 200,000 killed.
1716.—At Algiers; 20,000 perished.
1731.—In China; 100,000 perished.
1746.—Lima and Callao demolished; 18.000 buried.
1755, November 1.—Great Lisbon earthquake. In about eight minutes most of the city and 50,000 people were destroyed. Other cities in Portugal, a large part of Malaga in Spain, one half of Fez in Morocco, and half the island of Madeira were ruined.
1759.—In Syria; 20,000 perished.
1783.—In Calabria; shocks continued to end of 1786, towns and villages destroyed.
1797.—Country between Santa Fé and Panama destroyed, including Cuzco and Quito; 40,000 buried.
1805.—At Frosolone, Italy, 6,000 perished.
1812—In Caracas; whole city ruined; 10,000 inhabitants buried.
1815. In island of Sumbawa, East Indies; one of the most violent eruptions recorded in history.
1819.—At Cutch, India; many towns over a wide area converted into ruins.
1822.—Aleppo destroyed; over 20,000 perished.
1822.—Coast of Chile permanently raised.
1835.—In Chile; Concepción, Talcahuano and other towns were destroyed.
1839.—At Martinique; nearly half of Port Royal destroyed.
1842.—At Cape Haytien, Santo Domingo; 4,000 killed.
1851.—Melfi, Italy, wrecked; 14,000 perished.
1857.—Montemuro and other towns in the kingdom of Naples destroyed; 10,000 perished. (Lacaita says that in 75 years, from 1783 to 1857, the kingdom of Naples lost at least 111,000 inhabitants by earthquakes, or more than 1,500 a year, out of an average population of 6,000,000.)
1860.—At Mendoza, Argentina; about two thirds of the city destroyed, and 7,000 lives lost.
1863.—Manila, P. I., great destruction of property.
1868.—Cities of Arequipa, Iquique, Tacna, and Chincha, and many small towns in Peru and Ecuador destroyed; about 25,000 perished.
1874.—Cities in Guatemala destroyed; great loss of life.
1880.—Shock at Brieg, Switzerland; several killed.
1883.—Java and neighboring isles desolated.
1884.—Severe shocks in eastern counties of England.
1884.—Several Spanish towns destroyed.
1885.—In province of Granada, Spain; 690 perished.
1886, August 31.—Shocks throughout eastern United States; at Charleston, S. C., 41 lives and $5,000,000 worth of property lost.
1886, September-December.—Slight shocks at and around Charleston, causing panic.
1887.—Severe shock in southern Europe, especially in the Riviera; estimated that 2,000 perished.
1891.—In Japan; officially estimated that 4,000 perished and that 50,000 houses were destroyed.
1893.—Islands of Zante and Stromboli, the former west of Greece, the latter one of the Lipari group, west of Calabria, Italy, severely shaken. Great loss of lives and property at Zante.
1897—In Assam, India; much damage; many killed.
1906, April 18.—Violent shocks in California wrecked San Francisco and adjacent towns. Bursting of water mains in San Francisco gave the city over to what was the greatest fire in all history, lasting two days. Area burned was over three times greater than that of the Chicago fire, and ten times that of either the Boston or the Baltimore fire. Great loss of life, and $300,000,000 of property destroyed; over 300,000 homeless. The business section of San José was destroyed, 19 lives lost, and property valued at over $8,000,000 destroyed. Santa Rosa was swept by fire; 50 lives were lost. At Agnews Insane Asylum 117 patients and 9 attendants were crushed to death. Stanford University buildings were damaged to the extent of $2,800,000, including the fine Memorial Church. Much damage in the Santa Clara, Napa, and Sonoma valleys.
1906, August 16, 17.—At Valparaiso, Chile, causing great destruction of life and property.
1907.—Large part of Kingston, Jamaica, destroyed.
1909.—In Sicily and southern Italy, Messina and many towns and villages desolated. Appalling loss of life; thousands buried alive; the survivors homeless.

1908.—On December 28 in northwestern Sicily and southwestern Calabria there occurred one of the worst earthquakes recorded, and while lasting only a matter of about thirty-five seconds, the loss of life amounted to 76,000 people, the injured 95,470 and the homeless population over 1,000,000. Among the cities destroyed were Messina, Faro and Scolleta in Sicily and Reggio, Gallicia and Palmi in Calabria.
1910.—On May 5th in the Island of Costa Rico, town of Cartago, 1,500 people were killed by an earthquake.
1912.—In this year, Turkey was the scene of another earthquake, with the loss of 3,000 lives, injuring 6,000 and making 40,000 homeless.
1915.—Devastating large areas in Central Italy, one of the worst earthquakes recorded there came on January 13th, affecting 372 provinces, wiping out practically one entire town, Avezzano, and killing 29,978 people.
1917.—This earthquake started on December 24th and with its shocks felt intermittently for one week it caused the death of 2,500 lives in Guatamala City.
1919.—The eruption of the volcano Kalut on May 20th, in the Brengatand district, Java, destroyed thirty-one villages and population numbering over 5,000.
1920.—In Mexico the combination of an eruption and an earthquake caused the death of 3,000 people, the loss of thousands of dollars in property and the destruction of entire towns.
1920.—With a loss of life more appalling than any we have record of, the earthquake in the Kansu provinces of China on December 16th, was the cause of 200,000 of the population losing their lives, 300 square miles of territory badly damaged and the practical destruction of ten cities.
1923.—On May 29th in Persia, the entire Kharasoau province was shaken, causing the death of 4,600 people and destroying six towns and villages.
1923.—The Japanese Earthquake, first shock being recorded September 1st, and followed by others of varying intensity. Yokohoma was almost completely destroyed. 68,000 out of 93,000 homes were destroyed either by the earthquake or fire that followed it. Tokyo, the capital of Japan suffered heavily. The dead exceeded 100,000 people, with 146,000 wounded and missing.
1925.—In May, 400 Japanese killed and 500 wounded in another earthquake with property loss of 50 millions.
1930.—Italy in four provinces, 1,475 dead; 60,000 homeless.
1931.—Nicaragua. City of Managua, 2,000 dead; 60,000 homeless; damage $70,000,000.
1931.—Japan. On two islands, 1,000 dead.
1934.—India. Two districts, over 20,000 killed; whole towns wiped out.
1935.—India. At Karachi, 56,000 killed. At Quette, 30,000.
1935.—Formosa. Over 3,000 killed; 12,000 injured.

Important Tornadoes in the United States.

1882.—April.—Kansas—40 killed.
1892.—July 14.—Minnesota—50 killed.
1893.—June 20.—Kansas river valley—16 killed.
1893.—July 6.—Pomeroy, Iowa—63 killed.
1896.—May 27.—St. Louis and East St. Louis—500 killed.
1897.—Mar. 30.—The town of Chandlen, Oklahoma, was three-quarters wiped out.
1905.—May 9.—Marquette, Kansas—30 killed.
1905.—May 11.—Snyder, Oklahoma—130 killed.
1908.—Apr. 24.—Mississippi, Louisiana & Alabama—500 killed.
1913.—Mar. 13.—Illinois, Indiana, Tennessee, Louisiana and Texas—heavy property damage and great loss of life.
1923.—Apr. 25.—Oklahoma—100 killed.
1925.—Mar. 18.—This tornado arose in the Ozark Hills, Missouri, zigzagged into southern Illinois crossed over into Indiana and spent its real force in Kentucky and Tennessee. For more than five hours, this whirling wind swept over 300 miles of territory, covering parts of five states, taking the lives of 823 people, injuring 2,990 and making over 15,000 people homeless, entailing a loss of millions.
1926.—Oct.—Florida visited with hurricane. Principally in regions between Palm Beach and Key West. Hurricane hit the hardest in regions north of Miami, Fort Lauderdale and Moore Haven. —315 lost lives, 150 missing, 1100 injured, 20,000 homeless. Property damage $165,000,000.
1927.—Oct.—St. Louis and environs visited by tornado which killed nearly a hundred and destroyed 25 millions in property.

GREAT FIRES

64 A. D.—Rome burned 8 days, 10 of 14 wards.
1106.—Venice nearly destroyed.
1491.—Dresden destroyed.
1614.—Stratford-on-Avon, England burned.
1624.—Oslo, Norway, nearly destroyed.
1666.—Greatest London fire, 13,200 houses, 400 streets, 436 acres, St. Paul's and 80 churches, scores of other structures; loss estimated then at $50,000,000.
1728.—Copenhagen, 1650 houses, 77 streets.
1750.—Constantinople, 20,000 houses in three different fires.
1752.—Moscow, 18,000 houses.
1772.—Smyrna, 3000 buildings.
1782.—Constantinople, 17,000 houses, 50 mosques, 100 corn mills, with 100 dead. Others in 1784 (10,000 houses), and lesser fires in 1756, 1765, and 1767.
1790.—Carlscrona, 1087 houses, churches.
1811.—In Tyrol, a forest fire, 64 villages.
1812.—Moscow fired to drive out Napoleon; 30,000 houses, loss $150,000,000.
1822.—Canton, China, nearly all burned.
1835.—New York, 530 buildings, 32 acres, 1000 firms homeless, loss $15,000,000.
1842.—Hamburg, Germany, 4219 buildings, 100 killed; loss $35,000,000.
1850.—Cracow, Poland, largely burned.
1866.—Yokohama, two-thirds of native town.
1870.—Constantinople, 7000 buildings in Christian and diplomatic area, including foreign legations.
1871.—Great Chicago fire, 17,430 buildings, 250 killed, 98,500 homeless, 2124 acres burned over, one-third of city (half in value), loss about $200,000,000.
1872.—Boston, 776 buildings, 75 acres, loss $75,000,000.
1904.—Baltimore, 175 blocks; $85,000,000.
1906.—San Francisco. See under **Earthquakes.**

OTHER MEMORABLE DISASTERS

1836.—Leningrad, Lehman's Theatre	800
1845.—Canton, China, Theatre	1,670
1860.—Lawrence, Mass., factory	600
1863.—Santiago, Chile, church	2,000

LARGEST SHIP CANALS IN THE WORLD.

Opened.	Name.	Value to Commerce.	Location.
1876	**Amsterdam Ship:** 16½ miles long; 197 feet wide; 23 feet minimum depth.	Reduces distance to North Sea 50½ to 16½ miles.	Connects Ymuiden, on the North Sea, with Amsterdam. Annual net tonnage, 4,662,229 tons.
1902	**Bruges:** 6¼ miles long; 26¼ feet deep; 72 feet wide. Cost over $7,500,000.	Brings ocean trade from the North Sea to Bruges.	Connects Bruges with Heyst on the North Sea.
1822	**Caledonian:** length 60½ miles; depth 17 feet; width 100 feet; 25 locks. Cost up to 1849, $6,381,294.	Fishing fleets and small tourist steamers for access to the heart of Scotland.	Connects Atlantic with Moray Firth on the North Sea. Twenty-three of the 60½ miles are cutting, the rest small lochs; controlled by a government commission.
1914	**Cape Cod:** 13 miles long; 25 feet deep at low tide; 100 to 400 feet wide at bottom; sea level. Begun in 1909.	Shortens route from Boston to New York 70 miles and time of passage 4 hours, besides greatly lessening sea hazards.	Between Massachusetts and Buzzards Bay. Cost, $12,000,000,
1893	**Corinth:** 4 miles long; 26 feet deep; 72 feet wide. Cost $13,750,000. Tolls are 18 cents a ton and 20 cents a passenger.	Shortens voyage from the Adriatic to harbor of Athens by 202 miles. Saves 185 miles between Adriatic and Black seas.	Connects the Gulf of Corinth with the Saronic Gulf. Difficulties of navigation in the gulfs at the terminals cause larger vessels to avoid it.
1885	**Cronstadt or Pontileff:** 17½ miles long; 22 feet deep; 200 feet wide. Cost $10,000,000,	Carries vessels direct to St. Petersburg without unloading as formerly.	Connects Cronstadt with St. Petersburg.
1681	**Du Midi or Languedoc:** 148 miles long; 600 feet above sea level: 100 locks; 6½ feet deep; 60 feet wide; Cost $8,500,000.	Floats vessels of about 100 tons; shortens the route between French ports, and develops inland trade.	Connects the Bay of Biscay through the Garonne River with the Mediterranean Sea and the two terminals, Toulouse and Narbonne.
1900	**Elbe and Trave.** Cost nearly $6,000,000.	Opens up the trade of the interior with the Baltic Sea.	Connects the Elbe with the Baltic through the Trave.
1791	**Forth and Clyde:** 38 miles long; 160 feet above sea level; 8 to 10 feet deep; 39 locks.	Transports merchandise across Scotland and benefits small fishing boats.	Connects the River Forth with the Clyde.
486 B.C. to 18th C. A. D.	**Grand:** 1000 miles long; barges are drawn up inclined planes by capstans.	Connects the cities of Hangchow and Peking. Still used to carry rice and passengers.	Extends from Hangchow to Tientsin, China. Connects the waters of the Yang-tse-kiang with the Peiho.
1895	**Harlem Ship Canal.**	Cuts across Manhattan Island and obviates the passage around by the Battery.	Connects the Hudson and Harlem rivers.
1895 to 1914	**Kaiser Wilhelm or Kiel.** Length, 61¼ m.; width, 144⅓ ft. at bottom, 234 ft. at top; depth, 36½ ft.; locks, 1062⅔ × 147 × 45½ ft. Original cost, $40,000,000.	Saves over 200 miles in going from the Baltic to the North Sea. Passage occupies 8 to 10 hours. A sea level canal.	Connects the Baltic and North seas. Extends from Holtenau on the Baltic to Brunsbüttel on the Elbe. Enlarged to its present dimensions to serve larger war vessels, at the cost of $55,000,000. Reopened, June, 1914. Tonnage, 10,292,158.
1894	**Manchester:** 35½ miles long; 28 feet deep; 300 feet wide; 4 locks. Cost $75,000,000.	Seagoing vessels can ascend to Manchester. One of the greatest feats of hydraulic engineering.	Runs from the Mersey at Eastham just above Liverpool, to Manchester. A swing aqueduct carries the Bridgewater Canal over the Manchester Canal and lifts like a drawbridge to let vessels with masts pass through.
1855	**Sault Ste. Marie, St. Mary's or "Soo:"** 2 miles long; 25 feet deep; 160 feet wide at bottom; has one lock, the largest in the world. Cost $6,100,000.	Overcomes the obstruction of St. Mary's Falls in Michigan.	Connects the waters of Lake Superior with St. Mary's River and Lake Huron. Though open only 8 months in the year the traffic is the largest in the world, greater than that through the Suez, amounting to about 40,000,000 tons a year.
1896	**Sault Ste. Marie** (Canadian); ⅔ mile long; 150 feet wide; 22 feet deep; one lock. Cost $3,770,621.	Overcomes obstructions in St. Mary's River. Gives a waterway from the head of Lake Superior to the St. Lawrence.	Connects Lake Superior and Lake Huron; has a traffic of about 5,500,000 tons annually.
1869	**Suez:** length nearly 100 miles; uniform depth, 29 feet. Cost originally $80,000,000; improvements (1884-1889) cost $20,000,000.	Shortens sea route to India by saving passage around the south of Africa. Built by the French under De Lesseps.	Connects Port Said on the Mediterranean with Port Thewfik on the Red Sea. Annual value of traffic exceeds $700,000,000; time of transit, 16 hours 8 minutes. Accommodates a ship of 10,000 tons. Toll receipts exceed $22,000,000 from over 4,000 ships a year. England bought nearly half the stock from the Khedive (1875) for $19,855,320. Toll is 8½ francs per ton for loaded ships; 7 francs for empty ships; and 10 francs for passengers.
1829	**Welland** (Canadian): 26¾ miles long; 14 feet deep; 45 feet wide at bottom; 27 locks; Cost $28,000,000.	Passes around Niagara Falls. Completes the waterway from the head of Lake Superior to the sea.	Connects Lakes Erie and Ontario. Begun in 1824 and completed in 1833. Locks give a rise of 365 feet.

Ship Canals in Construction and Projectèd—*Continued.*

Opened.	Name.	Value to Commerce.	Location.
1914	**Panama Canal:** 50 miles long; depth — minimum, 41 feet, maximum 85 feet, average, 45 feet; summit level, 85 feet; width of channel at base, 300 to 1,000 feet; 6 pairs locks; time of passage (without delays), 10 to 12 hours. Total excavation, about 242,000,000 cubic yards. Cost, $375,000,000.	Will shorten the voyage from Liverpool to San Franvisco 43 per cent. and to Iquique 30 per cent. From New York to Australia, 28 per cent. shorter than by Suez. From New Zealand to England 15 per cent. shorter than by Suez.	Connecting the Atlantic and Pacific Oceans across the isthmus of Panama, between Panama and Colon. The dam at Gatum is to catch the overflow from the Chagres River. The reservoir has a surface area of 164 square miles; the dam at its crest is 115 feet above sea level, is nearly 8,000 feet long, and about 2,100 feet wide at its base. The hardest part of the work was about five miles of the Culebra cut between the Cascades and Paraiso. From 35,000 to 50,000 men were employed in the construction.
	Riga: 1000 miles long, 27 feet deep, 213 feet wide; to cost $500,000,000; five years to construct.	To connect the Baltic with the Black Sea and give an outlet for trade of the interior of Russia.	From Riga on the Baltic to Kherson on the Black Sea.
	Berlin: 25 feet deep, 190 feet wide; to cost $50,000,000.	To develop Berlin's trade and to make it accessible by ships of large size.	From the Baltic Sea to Berlin.
1921	**New Orleans Industrial:** 6 miles long, 30 feet deep and 150 feet in width, costing $20,000,000.	Allows New Orleans two outlets to the sea.	Connecting Lake Pontchartrain with the Gulf of Mexico.
1926	**Marseilles-Rhone:** 4½ miles long, 79 feet wide, cut 50 feet through hills; water depth, 10 feet.	Twenty-five miles travel in Mediterranean.	Allows boats to go direct from Lyons to Marseilles, without entering the Mediterranean.

PHYSICAL TERMS AND DEFINITIONS.

Adobe—Clay formations or soil which cover large portions of the states of Colorado, Utah, Western Kansas, Nevada, Texas, Arizona and California. This soil is workable when sufficiently moistened, but tillage is practically impossible when dry.

Aeolian Deposits—Dust, fine particles of soil and sand grains blown to sheltered places where they accumulate. In certain regions of China and the Mississippi Valley they have accumulated in deposits of great thickness, sometimes forming sandstones.

Air—The gaseous substance which fills the atmosphere surrounding the earth, although invisible it can be weighed, liquified or frozen to a solid. It provides oxygen for breathing, conveys sound and light, absorbs heat during sunshine. It is comprised of 23.10 parts oxygen and 76.90 parts nitrogen. Its exact height is unknown. At two and seven-tenths miles above the surface of the Earth its density decreases. Calculation seems to indicate that at a height of fifty miles it becomes too light to affect the barometer.

Alluvial Fan—Areas of sand or soil ranging from very small to large areas, often including many square miles, caused by erosion of hills or mountains, the material being brought down and deposited in fan shape mounds.

Altitude—Meaning height, used in reference to the physical relief, as the altitude of a mountain.

Anti-cyclone—High barometric pressure with out blowing winds, opposite of cyclone.

Aridity—Dryness of atmosphere, prevailing in regions of low rainfall, mostly in desert sections.

Aurora Borealis—A luminous display in the northern hemisphere, usually in moving bands or rays, ranging from silvery whiteness to yellow or red. The cause of this display is thought to be electrical disturbances in the atmosphere.

Avalanche—Ice and snow mixed with earth moistened from mountain slopes or glaciers dashing downward into the valley, causing great destruction, usually termed slides.

Barrier Reef—Coral reef bordering the shore, separated from the mainland by a narrow body of water or lagoon.

Bay—An arm of the sea partly enclosed by land, very often a sunken river valley.

Bayou—A body of water or a small lake, caused by the meandering of a stream and the meander finally being cut off from the main stream.

Beach—The fringe of land skirting the water's edge, which has been worn and torn by the waves. In some cases we have smooth sandy beaches, as at Atlantic City or Daytona or rocky ones as in Maine. *Barrier beaches* are bars of sand which have been piled up some distance from the shores by wave action, and the intervening strip of water is called a lagoon, if small and shallow, or a sound, if large and deep.

Blizzard—A driving snow storm, combined with a cold wind of great velocity.

Bluff—A high point of land with steep escarpments or a bold headland.

Bog—Wet spongy ground covered with decayed moss and other vegetable matter.

Boulder—A block of rock, which has usually been transported and which has no connection with the surrounding rock bed.

Breakers—When waves from the open sea reach water so shallow that perceptible wave motion reaches to the bottom, the increase friction retards the bottom of the advancing wave, and the waves following, gradually overtake it. The waves thus become shorter and higher and the front slope becomes steeper as the water becomes more shallow so that the water in its crest falls forward in a graceful curve dashing upon the beach in foam and spray, as a breaker.

Butte—A round topped hill of fairly steep sides.

Campos—Open plains are called prairie, llanos, pampas and campos in different sections of the world.

Canal—An artificial ditch, ranging anywhere from a few inches deep and a few feet wide to 100 feet deep and a number of thousand feet wide, the latter being used for transportation purposes, the Panama or Suez canals for example.

Canyon—A deep gorge, usually caused by erosion, the softer material being worn away, or rock faulting plus erosion.

Cape—A point of land extending into the water.

Cascade—A fall of water over a series of small precipices.

Cave—Formed by the prolonged solution and abstraction of mineral matter by percolating water. In some limestone districts, owing to the solubility of different rocks such caves or caverns are often miles in extent, as the Mammoth Cave in Kentucky, or the Luray Cavern in Virginia. By falling in of the roof of the caverns or the solution of the rock along the vertical joints that serves as channels for descending rain-water, sink holes are formed.

Chinook—A name given to a warm wind that descends on the eastern slope of the Rockies, melting the snow in the winter, and burning up the vegetation in the summer time.

Cliff—A steep, precipitous, vertical face of rock caused by water erosion as when hard and soft strata of rock alternate. The rapid erosion of the softer strata undermines the hard strata which falls from its own unsupported weight. If such fragments collect faster than erosion can remove them, they gradually form a *talus* which may cover and protect the softer strata from erosion.

Climate—The condition of warmth, coolness, dryness, dampness, clearness, etc., caused by various factors, such as nearness to the water, the altitude, the topography, type of winds, and general location. There are two general types of climate:

Marine Climate: effected by large bodies of water, resulting in a very moderate climate with no great extremes of temperature.

Continental Climate: A climate of great extremes, very warm summers, and cold winters found in areas where we have great open spaces with no water or other barriers to break it up.

Climatology—The study, or science of weather conditions.

Clouds—Mass of mist or fog floating in the air. Clouds screen the earth from excessive heat in summer, while serving as a mantel, they keep it warm in winter, by checking radiation. They present a variety of appearances and are divided into seven classes. The three simple ones are cirrus, cumulus, and stratus.

Cirrus: Consisting of white wavey lines or curled bands. It is the lightest of cloud forms, attains the highest elevation, supposed to consist of minute crystals of ice as in the snow flake and may be defined as frozen fog. They frequently herald cyclones.

Cumulus: Derived their names from being heaped up like touring mountains, often of glistening whiteness, appearing frequently in the summer when evaporation is rapid, forecasting generally thunder storms.

Stratus: Appear in long layers or ribbons seem most frequently in the evening.

Compound Clouds—Cirro-cumulus, cirro-stratus, cumulo-stratus and cumulo-cirro-stratus or nimbus.

Cirro-cumulus is made up of fleecy masses of cirrus which roll themselves up into rounded shapes, frequently known as "mackeral sky."

Cirro-stratus consists of layers of Cirrus clouds. They resemble shoals of fishes swimming parallel to one another, like the Cirrus, often the forewarner of a storm.

Cumulo-stratus, formed of heaps of clouds resting on layer clouds. General mass is often quite dark and threatening, although the edges are bright with sunshine behind the clouds.

Nimbus, simply a cloud of any kind from which rain falls.

Continent—The land elevations above the ocean are called continents, and then rather arbitrarily subdivided again for the purpose of classification on almost a political basis as South America, North America, Europe, etc.

Continental Shelf—The slightly submerged section of the ocean's bottom, in close proximity to the shore, before it drops off to a depth of a mile or more.

Coral Island and Reefs—Composed of rock, and nearly pure carbonate lime, formed by myriads of sea animals called polyps, living in vast colonies on the bottom of clear shallow tropical seas; growing upward in varied forms, they form islands and reefs. These islands seldom rise above ten to twelve feet from sea level, generally take the form of a narrow strip or ring of rocky land, wholly or partially surrounding a shallow lake or a lagoon of sea water. These islands are called atolls and are common in the warm part of the Pacific and Indian Oceans.

Cordillera—A combination of mountain chains, or the main mountain axis of a country.

Crater—The principal mouth or vent of a volcano, usually occurring in the hollow or summit of a cone.

Crevasse—Glaciers passing through narrow gorges and gliding over steep irregularities, crack and splinter, the lower parts break away from the upper forming fissures of great depth called Crevasses.

Currents.

Aleutian Current—When the Japanese Current, (also called Kuro Shiwo), passes the Aleutian Islands, it receives that name, taking a southeastwardly course. It gives to Western North America its enormous rainfall and abundant timber growth. It waters Washington and

Oregon, turns westward and again becomes part of the Equatorial Current.

Equatorial Current (Of the Atlantic)—Crosses this ocean between the shores of Africa and South America, striking the latter continent at Cape Saint Roque. Here it divides. One portion going southward, being named the **Brazil Current**. The other going northwestwardly, is divided by the West Indies. The main section enters the Caribbean Sea, becoming the well known Gulf Stream.

Gulf Stream—On leaving the Strait of Florida parallels the Atlantic seaboard, as far as Newfoundland, turns eastward striking the Azores, where it divides, one branch passing north toward the British Isles, the other to the western shores of Europe and Africa, finding its way back into the Equatorial Current. In length it is about 3000 miles. Its breadth at the Strait of Florida is about 40 miles. In the Middle Atlantic its breadth is about 120 miles. In volume it exceeds the Mississippi more than 1,000 times. The climate of Western Europe is tempered by the winds blowing over the stored up heat of the Gulf Stream.

Japanese Current—Is the Gulf Stream of the Pacific, having a two-fold office, watercarrier and heatbearer. Its principal effect is on the northwestern coast of the United States, Canada and Alaska.

Labrador Current—The Labrador Current flowing out of the Arctic Ocean enters Baffin Bay, striking the coast of East Canada or Labrador, from whence it gets its name to the Island of Newfoundland, reaching as far south as Cape Cod. This current teems with fish and gives rise to the great fishing industry of Grand Banks. The Newfoundland fogs are caused by the cold Labrador Current meeting the warmer Gulf Stream.

From the Antarctic a broad drift flows toward the equator, divides off Cape Horn, one branch passing into the Atlantic and the other, the *Humboldt or Peruvian Current* enters the Pacific, carrying its cool waters along the west coast of South America. When these waters touch the equator it is still too cool for the growth of the coral polyp.

Cyclone—Bodies of air of high pressure, displacing areas of low pressure or vice versa give us cyclonic areas or cyclonic storms. These pressure areas aid us in forecasting the weather. The popular meaning of this term seems to be rapidly changing areas of pressure, giving us very heavy winds and much rain.

Delta—A sand or mud bar caused by the deposition of sediment at the mouth of a stream.

Desert—A very arid region with only a very small amount of rainfall.

Dew—Moisture formed on cold surfaces, due to condensation of the water vapor, in the air.

Divide—The name given to the escarpment that separates two or more river systems.

Doldrums—Occurring within 15° north and south of the Equator. An area of low barometric pressure, being free from movements of the atmosphere. It is the most difficult part of the ocean for the sailors to cross, hence by the sailors called Doldrums.

Drumlin—In Central New York, Eastern Massachusetts, and southern Wisconsin, ridges of glacial *debris* or *till* having an oval or elongated oval form and smooth rounded surfaces are called drumline, usually occurring in the flat lowlands, elliptical in form and the larger axis always parallel to the direction of ice movement. Height rarely exceeds 100 to 200 feet.

Dunes—The surface of the desert consisting in some places of sharp stones and in others of gravel and of sand, the latter when driven before the wind are arranged in huge billows, called dunes. Found in the Sahara and along the Atlantic coast and some of the western states.

Dust—Finely divided organic and inorganic matter in the atmosphere.

Earth—The name given to the planet on which we live.

Earthquake—Movements or tremblings of the earth's surface due to some faultings or fissures formed under the earth's surface.

Equator—An imaginary circle around the earth, 90 degrees from each pole.

Erosion—The wearing away of the earth's surface. *Mechanical erosion*—the physical washing or tearing away of the soil by rain, snow, wind or glacial action. *Leaching* is the dissolving out of certain elements in the soil as the leaching of the phosphorous or the nitrogen.

Escarpment—A steep slope.

Estuary—Very deep indentations in land, affected by the tides, usually caused by a sunken river mouth.

Fault—A fissure or a series of fissures in the rock structure oftentimes in retaining and horizontal positions.

Fiord—A narrow inlet of the sea with steep sides.

Fog—The condensation of water vapor in very fine particles near the earth as contrasted with the condensation at higher altitudes or clouds.

Frost—Condensation and freezing of water vapor on a cold surface.

Geyser—A hot spring which spouts steam and hot water, intermittently.

Glacier—A large mass of accumulated ice in motion. The residues or deposits left by the glacier were numerous, such as *eskers*, *long ridges* of sand or gravel, *moraines*, and *kame*.

Gorge—A very narrow valley with steep sides.

Gulf—A large body of salt water, partially landlocked.

Hail—Precipitated water vapor that has frozen at a high altitude.

Harbor—An indentation in land sufficiently protected for ships to anchor, and deep enough for ships, shipping and dock facilities.

Hardpan—A hard layer below the subsoil usually of impenetrable clay.

Heaths—Tracks of open level land covered with shrubs of the Heath family, occurring largely in Northern Europe.

Hemisphere—Half of the terrestrial sphere divided either, by the equator into Northern or Southern hemispheres, by a meridian into Eastern and Western (so that North and South America are contained in the Western) or into divisions known as *Land* and *Water* hemispheres.

Hill—A land elevation.

Horizon—The apparent visual juncture where earth and sky seem to meet.

Humidity—The amount of water vapor in the air. *Relative humidity* is the ratio between the actual amount of vapor in the air and the amount it could hold at saturation. *Absolute*

humidity is the amount of water vapor actually in the air.

Hurricane—Cyclonic storms on a violent scale, with high winds, thunder and lightning, usually in tropical regions.

Ice—Water frozen in a solid state or water in a crystalline form.

Iceberg—A great floating mass of ice, usually broken off from a glacier.

Island—A body of land completely surrounded by water. They can be divided into two main classes.

Continental—Meaning islands which rise from the submerged continental borders, and not from deeper parts of the ocean floor.

Oceanic—Arise from deeper portion of the ocean's floor. In structure either volcanic or coralline.

Isobar—A line on a map connecting all areas or places having the same barometric pressure at a definite time or period of time.

Isotherm—Lines connecting areas having the same temperatures at a definite time or over periods of time.

Isthmus—A narrow neck of land, connecting two larger bodies of land.

Kames—Closely related to drumlin, are mounds or knolls of sand and gravel or glacial debris, which have been more or less stratified through water action.

Lagoon—A stretch of shallow salt water between a barrier beach and the shore, if quite deep is called a sound.

Lake—A body of water surrounded by land. Formation of lake basins can be generally classified as follows: (1) Great (diastrophic) movements of earth's crust. (2) Drainage obstruction by mountain elevations. (3) Land subsidence caused by earth movement or earthquakes. (4) Moraines left by melting of ice. (5) Glacial erosion. (6) Volcanic action.

Latitude—Imaginary circles around the earth in an east-west direction parallel to the equator. Since it is 90 degrees from the equator to either pole, each degree represents about sixty-nine miles. North of the equator it is north latitude, south, it is south latitude.

Lava—Molten rock underneath the surface of the earth or rock that has been poured out of the earth in a molten state.

Levee—(Natural) Alluvial plain built up along the channel of a river.

Lightning—Electrical discharges in the atmosphere from one cloud to another, noticeable because of the brilliant flashes.

Llanos—West of the Buina Highland, the Amazon River Valley becomes a treeless or prairie plain; during wet seasons flooded, and in the dry weather covered with a luxuriant growth of grass resembling a great meadow, called **llanos.**

Longitude—Imaginary circles around the globe in a north-south direction, passing through both poles, the lines of the circles being called meridians. The greatest distance between the meridians is about 69 miles. The English speaking people have designated Greenwich Observatory, England, as the starting point and running 180 degrees to the East, called east longitude and 180 degrees to the west being west longitude.

Magnetic Poles—There are two magnetic poles, one in the northern and one in the southern part of the globe. Both shift slightly from time to time. The last position of the northern pole was latitude 70 degrees north, and longitude 97 degrees west. The southern, latitude 72 degrees south, and longitude 153 degrees east. The magnetic needle of the compass is directed towards the northern pole in the northern hemisphere, and towards the southern pole, the other side of the equator.

Marsh—An area of low, watery land.

Meander—A gently flowing stream, having soft banks which are easily turned by obstacles and forms many curves, almost meeting itself in places. Such windings are called meanders.

Mesas—Isolated table lands or plateaus.

Mineral—An inorganic chemical substance found in nature.

Mineral Waters—Springs or wells that have in solution, chemicals, that are thought to have a beneficial effect on the human body.

Mirage—Adjacent layers of the air near the earth surface, owing to differences in temperature or humidity have widely different densities. The refraction and total reflection of light rays in traversing such layers give rise to distorted, displaced or inverted images. They often occur in the desert. Distant objects seem near, or suspended in the air. Sometimes the traveler thinks he sees sparkling water, only to find he has been pursuing a mirage.

Monadnock—Knobs of hill or hard rock left standing due to the glacier wearing away the softer rock.

Monsoon—Land heats and cools much more quickly than water masses and thus this difference in temperature causes winds, blowing either from the water to the land or vice versa. These winds are called monsoons.

Moraines—Rocks and debris brought down from mountain slopes, from ravines by frost and avalanches, accumulating on the surface of the glaciers forming bands of earth and stone, are called moraines. When occurring on the side of the glacier are called *lateral moraines.* At the confluence of two glaciers and two lateral moraines coming together, they form a *medial moraine.* At the lower end of the glacier, where the ice melts and leaves them, the immense deposits are called *terminal moraines.*

Ocean—A large body of salt water in the great hollows and low places of the earth, covering about three-fourths of the globe.

Pampas—Level plains of the Plata River Valley lying south of Amazon Basin. The larger part of the basin is in the form of level plains, with occasional hills and low mountains, called Pampas. The northern portion is wooded and is famous as hunting ground, known as The Chaco.

Pass—A narrow opening of low elevation through mountains or high hills where the heading together of transverse valleys making it possible to cross lofty mountain ranges. Mankind has improved these natural courses of travel, and some of them have been made marvels of engineering skill. The Simplon, St. Bernard, and St. Gothard in the Alps are the most noted.

Peninsula—A body of land nearly surrounded by water, connected to the mainland only by a small neck of land.

Plain—An area of land whose surface is rela-

tively flat and level. *Flood plains* are areas which are so low that they are constantly in danger of being flooded and in fact the top soil is usually a result of these deposits. This silt covered plain is called usually an *alluvial plain.* Plain areas that have been caused by erosion are called *plains of denudation.*

Plateau—A plain at a goodly elevation above sea level.

Prairie—A treeless plain or plateau.

Precipice—An almost perpendicular cliff.

Quick Sand—A sandy area so loose that heavy bodies easily sink in it.

Rain—Condensed water vapor, falling to the earth in fairly large drops.

Rainbow—After or during a rainstorm, with the sun shining, the refraction and reflection of the sun's rays on the drops of water gives us an arch of the spectrum colors in the sky.

Rapids—Cascades—denote more or less a violent descent of streams from a higher to a lower level.

Relief—Elevations or inequalities in land surface.

Reservoir—A storage basin either natural or artificial for water.

River—A body of water flowing in a depression which may be either slight or very great. The tributaries of a river are the smaller streams flowing into it. A river system is composed of the streams and all its tributaries, whereas a river basin is the area drained by the entire system. The source is its starting point, the mouth is where it empties itself into the sea.

Rock—The consolidated material comprising the hard shell of the earth's crust. *Igneous rock*—rocks that have been solidified from molten state such as quartz, feldspar or granite. *Sedimentary rock*—rock which has decomposed, been re-deposited, then through pressure cemented together forming for example, limestone, shale, sandstone, etc. When either igneous or sedimentary rock or both have been buried, and then due to heat and pressure, a change of form and structure, called metamorphosis, has resulted, the rocks are called *metamorphic rocks.* To this group belong gneisses, schists, marbles, etc.

Saint Elmo's Fire—In storms at sea, the masts and yards of the ship are sometimes tipped with balls of electric light due to electricity, passing without noise when the clouds are low, between the clouds and tips of the spars of the ship.

Sargasso Sea—The Spanish name—sea weed—Vast collections of sea weed gathered at those places in the different oceans most free from influence of currents.

Silt—Deposits carried along by sluggish streams and dropped.

Silvas—Lying within the tropical rain belt of the Amazon River Valley, together with the warm climate and rich alluvial soil has been the cause of a remarkable dense forest growth known as *Silvas.* During the rainy season it is flooded with water.

Simoon—Desert whirlwind, intensely hot and air so rarefied as to be suffocating.

Slough—Wet and marshy place. This term is generally associated with a reedy pond commonly caused by inlets or small channels from river or creek.

Snow—The condensation and subsequent freezing of water vapor in particles too large to be supported in the air.

Soil—The covering of the earth's surface, composed of decomposed rock and humus or organic matter. Soils are usually classified as of two kinds—*residual,* meaning that it has remained in the place of decomposition and bears a relation to the underlying rock and transported soil which has been formed and carried by water which is called *alluvial,* by a glacier called *glacial,* and *loess* that is carried by the wind.

Sound—A body of salt water connecting two larger bodies of water, much larger than a strait.

Stalactites—As water with limestone in solution drips down from the roof of a cave, the water is slowly evaporated, leaving the limestone forming a kind of stone icicle. Where it doesn't evaporate on the roof, it drops and evaporates on the floor and forms there, a chrystaline column called *stalagmites.*

Steppe—A grassy plain or plateau with no forest covering, as the Russia Steppes.

Strait—A narrow neck of water connecting two larger bodies of water, as Bering Strait.

Swamp—A low damp watery area, often densely overgrown with underbrush and trees, as the Mangrove Swamps of Florida.

Temperature—Degree of heat or cold.

Thunderstorm—A storm in an area of high pressure and humidity, accompanied by thunder and lightning.

Tide—A great wave or uplift, caused by the attraction of the moon and to some extent the sun. There are two tides a day. In midocean the height is only one or two feet, but when it hits the coast line with indentations, the height of the tide changes with the slope and the size of the indentation. In the Bay of Funday which is funnel shaped, the tides rise as high as 60 feet, whereas the average is from 3 to 6 feet.

Topography—A description of the relief of the earth's surface—mountains, plains, deltas, lakes, etc.

Tornado—A violent wind with dark clouds, in the form of a spout in the center. This center, the heart of the violence of the wind, is accompanied also by heavy rain, hail and often thunder and lightning.

Tundras—The Russian name for level treeless and marshy plains.

Typhoon—A name given to cyclonic storms in the West Pacific and Indian Oceans, attaining a speed often of from 60 to 70 miles an hour. These often continue for a week or more.

Undertow—The receding waves flowing near the ocean bottom cause a back current, often of great strength, which in a high sea or on an open coast is dangerous.

Universe—The entire aggregation of physical things, constituting some kind of a system.

Valley—A depression in the earth's surface with elevation on either side.

Volcano—An opening in the earth's surface through which molten lava and partially molten materials find their way out. After several eruptions a cone shaped mound is often built up but sometimes it remains a fairly level surface.

Watergap—Water flowing through a gorge in the mountains.

Water Spout—As a heavy storm passes over water bodies similar to a tornado on land, a funnel shape spout of water is formed, the narrow end on the water surface, caused by the condensation of the water vapor and the whirling motion of the wind.

Waves—Undulating motion of the surface of the ocean caused by friction of the wind on the water surface.

Weather—The atmospheric condition of warmth, dryness, windiness or cloudiness at any one time.

Wind—Air in motion, caused by a difference in temperature and pressure. The air is warmest in the torrid zone and coldest in the frigid zone, thus causing a circulation of warm air upwards and toward the poles, and as it becomes cooler, drifts are pulled back to the equator. *Doldrums* are belts of calm at the equator where the warm air rises. The *horse latitudes* are areas where the air is falling, at 30 degrees north and 30 degrees south of the equator. The *trade winds* are winds blowing near the surface, from both horse latitudes toward the equator. In the northern hemisphere they are northeast winds and in the southern, southeast. *Prevailing westerlies* are the winds blowing northeast in the northern hemisphere, and northwest in the southern hemisphere.

Zones—The world has been divided into five temperature belts or zones. The most northern zone, the *North Frigid*, extends from the North Pole to the *Arctic Circle*, an imaginary circle twenty-three and one-half degrees below the Pole. The most southern, the *South Frigid*, extends north to the Antarctic Circle, a circle twenty-three and one-half degrees north of the South Pole. The Torrid Zone is a belt 47 degrees wide, twenty-three and one-half degrees north and twenty-three and one-half degrees south of the equator, paralleling the equator. The *North Temperate Zone* lies between the Arctic Circle and the *Tropic of Cancer* which is the northern extremity of the Torrid Zone and the *South Temperate Zone* lies between the Antarctic Circle and the *Tropic of Capricorn* which is the southern extremity of the torrid zone.

THE GOVERNMENT WEATHER BUREAU.

The weather is probably our most common subject of conversation. We all speculate upon it and predict the day's wetness or dryness, yet very few of us know anything about it. But there are certain classes of the population to whom the weather is a very vital subject and one that gives them much concern at times. The fishermen as a class, watch very closely the various changes in the atmosphere. The fruit grower, the wheat grower, the transportation companies doing a business in the perishable line—all are very much bound up in the question of general conditions of the thermometer or the barometer.

This then is the job of the weather bureau, to disseminate all the possible information about the elements that can be fairly accurately given. The weather bureau was put under the Dept. of Agriculture in the month of July, 1891. Twice a day at eight o'clock the records of the past twelve hours are brought together—the wind, the weather, air pressure, temperature, clouds, humidity, rainfall, etc. and five minutes after the material has been collated, it is on its way to Washington. From there it is relayed to the 180 Branch Weather Bureaus.

Trained men chart these figures as fast as they come in, so that a complete picture of the weather conditions of the country is produced in a short space of time. Along with all the reports from the various parts of the U. S., there is also much daily information from other various parts of the world, such as the northern part of South America, Central America, the West Indies, Canada, Alaska, and Bermuda. The storms coming in that affect the U. S. very often start in these regions that we have just mentioned and so it is necessary to follow their movements.

Twice daily, forecasts are made from the Weather Bureau districts at Washington, Chicago, Denver, New Orleans, and San Francisco. At nine every morning a bulletin is sent out covering the probable conditions for the next 36 hours. These reports are telegraphed to 1,600 distant points, mailed to 100,000 people, and available to 6,000,000 telephone subscribers.

Now the question arises, who are some of the specific classes that are benefiting from this information? The class of shippers that are dealing in perishable commodities are very careful to scan every bit of weather news in order to protect the merchandise that they are shipping from changes in the temperature or the barometric pressure. A change, however slight, may wipe out the salability of the goods.

The great increase in flying has called to the foreground the need of properly charted lanes and a daily knowledge of the air conditions and pockets. The Bureau has undertaken such a task and gives out information on what they call, "flying weather." These tests are made daily by the means of balloons filled with light gases. The farmer, especially in the semi-tropical regions find sudden frosts one of their great problems and they were at loss as to how to solve it until the Government came along and gave them the assistance of the Bureau and the advance of the cold spell so that smudge fires or oil heaters could be put in.

On the stock ranges where the terrific blizzards come down quite suddenly, the Bureau has been of great help. In the prediction of floods and the probable amount of the rise of the rivers. The raisin growers are most grateful for the Bureau's timely help in giving them enough time to get their crop under cover. The work of the Bureau cost in 1919, $1,880,210 and it has been estimated that the farmers are better off to the extent of $17,580,000 and the commercial interests to the amount of $56,000,000.

COMMERCIAL GEOGRAPHY OF THE WORLD.

ABYSSINIA. A monarchy in east Africa. The country is a high table-land, with high mountains, many flat-topped. The people are dark-skinned, and are Hamites, Semites, and negroes, with Amharic the principal language. Agriculture is poorly handled, and inferior grades of cattle, sheep, goats, small horses, mules, and donkeys are raised. The native products comprise cotton, sugar cane, dates, vines, hides, barley, millet, wheat, and tobacco. There are valuable forests containing rubber trees, etc., and the minerals are iron, some gold and coal, silver, copper, and sulphur. Imports: cotton goods and yarns, textiles, hardware, arms, and ammunition; exports: coffee, hides, wax, ivory, civet, and gums. The capital is Adis Ababa, and the chief port, Jibuti, in French Somaliland, serves as the port for the country.

ADEN. A peninsula and town near the southwestern end of Arabia. A name frequently applied to the whole British territory in that part of Africa. The peninsula proper is of volcanic origin. The rainfall is light, cultivation of the soil is almost impossible, and all the necessaries of life have to be imported. The chief exports are coffee, gums, hides, skins, piece goods, and tobacco. Water is obtained, partly from wells and partly from the hills, where it is collected and conducted into cisterns. The town of Aden is strongly fortified, and the two most populous settlements are Steamer Point and Shaikh Othman, on the mainland. Of the two harbors only Aden Back Bay is of any commercial importance.

ADMIRALTY INLET. The main passage to Puget Sound, in the state of Washington. It is from one to ten miles wide. Seattle, Port Townsend, and Tacoma are the chief towns on it. The channel is several hundred feet deep.

AFGHANISTAN. A monarchy in central Asia between Persia and India. Surface is mostly a desert, relieved by irrigation, there being no navigable rivers, but a few very good roads. There are two harvests, one in the summer of wheat, barley, peas, and beans, and one in the fall of rice, millet, maize, with enormous yield of pears, apples, peaches, cherries, grapes, figs, mulberries, almonds, etc., grown in the irrigated mountain valleys. The minerals are copper, lead, and iron, with some gold and precious stones, notably lapis lazuli. Imports: cotton goods, dyes, sugar, and Chinese teas; exports: valuable quantities of camel and goat hair fabrics, preserved and natural fruits, some drugs, grain, cattle, and hides. The capital is Kabui, a very cold place.

AFRICA. The third largest continent, counting the two Americas as one. In the north from the Atlas Mountains stretches southward the land of deserts, the great Sahara and the Libyan; at the equator is the land of dense forests, savannas, and great rains; in the south spread the prairies or veldts, broad grass lands, with desert patches, the eastern section of which is dominated by the rain of the "trades," forming an agricultural district. The great rivers are the Nile, the Zambesi, and the Kongo, with the great lakes as possibilities for future irrigation. England, France, Italy, and Portugal hold the future development of this continent in their hands.

ALABAMA. An important Southern state. From the northern mountains the land gradually slopes through the plateaus of agriculture, the levels of coal and iron, to the lower valley lands, which run to sea level. There are heavy forests of pine in the south. The leading industry is agriculture, with products of cotton (the fifth largest cotton producing state), maize, oats, fruit, peanuts, sweet potatoes, and sugar cane. It is well watered by the navigable Alabama, Tombigbee, and Chattahoochee rivers. The minerals include large quantities of high-grade coal and iron, aluminium, copper, corundum, various clays (fire, porcelain, etc.), lithographic stone, marble, phosphates, slate, and some tin and natural gas. Leading manufactures are coke, iron, cotton goods, lumber, and cottonseed oil. The principal cities are Montgomery, the capital, Birmingham, and Mobile.

ALASKA. It was bought from Russia for $7,200,000 in 1867. Its area is about double that of Texas. Only the great water courses have been explored to any extent, the interior being practically unknown by reason of a severe climate and difficulties of travel. There is little agriculture, except in the small interior plains and lowlands. The neighboring Pribilof Islands are the richest fur sealing grounds in the world; the great industry of salmon catching and canning is valued at many millions annually. There are immense forests of conifers, birch, poplar, and aspen yet untouched. The minerals are the famous gold deposits in the Yukon valley, and at Cape Nome, etc., rich copper and much coal. The seat of government is now Juneau instead of Sitka; Nome is the largest city. Several thousand miles of waterway are navigable in summer, and many harbors are open through the winter. Southern Alaska consists of many islands, the Aleutian, Sasignan, Rat, and Fox being the principal ones.

ALBANIA. A small principality on the mountainous east coast of the Adriatic Sea, just south of Jugo-Slavia, that declared its independence in 1912 and was agreed to shortly after by the London Ambassadorial Conference. It is a primitive country, wild, rugged and mountainous, few roads and no railroads to mention, barren with the exception of a few fertile valleys and very difficult to rule because of this land contour. The area is about 17,300 square miles. The products are wool, grains, corn, sheep, goats, tobacco, olive oil and fruits near the Adriatic. The mountain land has good forest areas of walnuts, oaks, chestnuts, beeches and firs. Manufacturing consists of simple processes such as flour milling and the making of olive oil. Tirana is the capital.

ALBERTA. A northwest province of Canada, between Saskatchewan and British Columbia, rapidly developing. Principally prairie, with light woodlands at the foot of the mountains. Well watered, having the Athabasca emptying into the Mackenzie, the Saskatchewan into Hudson Bay, and numerous tributaries into the Missouri. A splendid agricultural section, producing wheat, oats, barley, potatoes, hay, clover, sugar beets, some flax, and great quantities of butter annually. Horses, cattle, sheep, and swine are raised in great numbers. Vast coal deposits and some gold are found. Principal cities: Calgary and Edmonton.

ALGERIA. A French colony in north Africa on the coast of the Mediterranean. Largely agricultural; grapes, cereals, tobacco, cattle, sheep, and goats are raised; extensive deposits of phosphates and fine marble quarries are found. Imports: cottons and woolens, clothing, hides, machinery, metal work, and woodwork other than lumber and furniture; exports: large quantities of wine, cereals, sheep, zinc ore, cork, oil, fresh and dried fruits, canned sardines, anchovies, etc. The capital is Algiers, with Oran the chief port.

ALLEGHANIES. The mountain range traversing Pennsylvania, Maryland, West Virginia, and Virginia, parallel to the Blue and Blue Ridge ranges. The general direction is northeast to southwest. Rich in coal and iron. The name is sometimes loosely applied to the whole Appalachian range.

ALPS. A mountain system of southern Europe, including Switzerland, and extending into Italy, Austria, France, and Germany, covering an area of about 80,000 square miles. There are hundreds of peaks over 10,000 feet; Mont Blanc, the highest, is 15,780 feet. There are a number of passes over the range, famous for historical reasons and as roads, Stelvio Pass being the most elevated carriage road in Europe, 9,055 feet above the level. Four railroads cross the Alps: Mont Cenis, between France and Italy; St. Gothard, connecting Lake Lucerne and Lago Maggiore; Simplon, from the upper valley of the Rhone to Lago Maggiore; Brenner, from Munich and Innsbruck to Verona and Venice. Arlberg is the great highway between Austria and Switzerland. The Gornegrat railway reaches an elevation of 9,908 feet near the Matterhorn, highest railway in Europe.

AMAZON. The largest river system in the world, located mainly in Brazil. It is not so long as the Mississippi, or the Nile, being about 3,900 miles long, but it is wider, deeper, and, with its multitudinous tributaries, has more navigable surface. Its name means "boat destroyer," from the tidal bores battling at the mouth, dangerous to navigation, and felt 400 miles up the river. It is two miles wide entering Brazil, but widens to 50 miles at its main mouth, and 150 miles at the sea. Its waters are yellow with washed-out soil, and stain the ocean for 600 miles beyond the river mouth. Its importance in developing Brazil can scarcely be overestimated. It drains the central or coffee and rubber section, called Selvas.

AMERICA. The great land masses occupying the western hemisphere. It was first discovered by Christopher Columbus (1492). The greatest length is over 9,000 miles, exclusive of islands, and its mainland width is 3,300 miles. It is divided into two nearly equal parts by the Isthmus of Panama. North America has a very irregular coast line; is broken by two moun-

GREAT INDUSTRIES—FRUITS AND NUTS

1 Grove of seedling orange trees. 2 Orange grove amid snow-capped peaks, California. 3 Orange clusters. 4 Picking oranges. 5 Orange grove in bearing, California 6 Orange grove in bloom. 8 Luscious grapes ready for picking. 7 and 9 Prune orchards in bloom, California. 10 Cultivating orange seedlings.

tain ranges, the Rockies in the west and the Appalachians in the east, inclosing the great Mississippi valley. The highest mountain is Mount McKinley, 20,464 feet. The principal Arctic river is the Mackenzie; in the west are the Yukon, Columbia, and Colorado. The largest rivers flowing into the Gulf of Mexico are the Mississippi and the Rio Grande. The most important eastern rivers are the St. Lawrence, Hudson, and Susquehanna. British North America extends from the Arctic Ocean on the north, and from the Pacific on the west to the Atlantic on the east, and is known as the Dominion of Canada. Below that frontier line, across the middle of the continent, the United States extends to the Gulf of Mexico in the south and from the Pacific to the Atlantic. Mexico lies southwest of the United States. Central America lies between Mexico and Panama; its Cordilleras connect the Andes and the Rockies. South America has an even coast line. The Andes extend along the west coast from Central America to Cape Horn, and the highest peak is Aconcagua, 23,088 feet. In the east are the Brazilian Alps. The great rivers are in the east, including the Amazon, Orinoco, and La Plata, whose basins form three groups of plains: selvas, llanos, and pampas. South America is divided into eleven republics.

ANDAMAN ISLANDS. A group or chain of islands politically attached to British India as a province with the Nicobar Islands, under a chief commissioner. The surface is densely covered with valuable forests, except where clearings have been made. The agricultural products are maize, rice, manioc, tea, potatoes, and artichokes, there being introductory stations growing indigo, cacao, and coffee. Port Blair and Port Cornwallis are two natural fine harbors. Since 1858 the islands have been a penal settlement of India. The Andamanese have inhabited their territory since prehistoric times.

ANDES. The great mountain chain of South America extending from Cape Horn, along the Pacific coast, a distance of 4,500 miles. The average breadth is 150 miles, and the average height 12,000 feet. All countries touched by this great range are rich in minerals: gold, silver, copper, iron, lead, coal, salt, sulphur, asphalt (Venezuela), emeralds (Columbia), platinum, zinc, nickel, and a variety of valuable earths. The Oroya railway crosses the range at a height of 15,665 feet, connecting Lima and Callao with Oroya and Concepcion, and Mollendo with Puno on Lake Titicaca.

ANDORRA. A republic in the eastern Pyrenees, inclosed by mountains, and almost inaccessible. It is semi-independent, under the protection of France and the Bishop of Urgel, Spain. There is much good pasture land; vines and fruit trees flourish on the lower lands, and the mountains are rich in minerals, especially iron. The principal industry is the production of coarse cloth. Exports: wood, metals, ores, cloth, and dairy products.

APENNINES. A spur of the Alps running through Italy with a length of about 800 miles, 25 to 85 miles wide. The highest point is Monte Corno, 9,583 feet; the average height is about 4,000 feet. Some very rich and apparently inexhaustible marble quarries are the principal mineral deposits.

APPALACHIANS. An extensive mountain system in the United States extending from the Gulf of St. Lawrence to northern Alabama. The principal divisions are the Laurentian Plateau in Canada, the White, Green, Catskill, Alleghany and Blue Ridge mountains, which include the Shenandoah, Cumberland, Clinch, Highlands of New Jersey, and the Black Mountains. The highest peak is Mount Mitchell in the Black Mountains (6,711 feet). The system is very rich in coal, petroleum, natural gas, aluminium, iron, zinc, lead, copper, manganese, cement, slate, building stone, and some gold, silver, nickel, and cobalt.

ARABIA. The southwestern peninsula of Asia. Principally desert area without rivers; the limited fertile areas produce coffee, dates, bananas, figs, spices, and drugs; other agricultural products are wheat, millet, barley, tobacco, indigo, cotton, tamarinds, sugar. Irrigation is likely to make a marvelous change in the coming years. Minerals: iron, copper, lead, coal, basalt, and asphaltum, with emeralds, agate, carnelian, onyx, and pearls from the Persian Gulf. Imports: chiefly cotton piece goods; exports: sheep and goat skins, mother-of-pearl, gums, fruits, drugs, and a few very valuable horses. Leading cities: Mecca, Hail, El Riadh, Jiddah, Hodeida, Medina, and Aden.

ARABIAN SEA. The part of the Indian Ocean between India and Arabia, a very busy waterway. The Persian Gulf and the Red Sea are two of its arms. The Indus river flows into it on the east; its chief ports are Bombay, Maskat, and Aden.

ARAL SEA or LAKE. The largest salt water lake in Asia and the fourth largest in the world. It is remarkable for quantities of fish. Navigation is difficult, owing to its shallowness.

ARCTIC OCEAN. The water area lying north of Europe, Asia, and North America, surrounding the North Pole, connected with the Atlantic Ocean through Davis Strait and the open sea between Greenland and Norway, and with the Pacific Ocean through Bering Strait. Its coasts along Europe and Asia are low, having two deep indentations, the White Sea and Gulf of Obi. Along North America it has a most irregular collection of islands called the Arctic Highland, containing many gulfs, bays, and channels. Several large rivers flow into it; from Asia, the Obi, Yenesei, and Lena; from Europe, the Dwina, Onega, and Petchora; from North America, the Mackenzie. Enormous fields of ice and snow cover the land, which break up in the summer and huge pieces pass down every year between Greenland and Iceland. The Arctic current passes out of the ocean southward at the west along the coast of Greenland to Labrador. A few birches, dwarf willows, and juniper trees grow in places; whales, seals, walruses, bears, Arctic foxes, and wolves are plentiful, as well as birds. The people in the Highland are Eskimos. In 1909 the North Pole was reached by R. E. Peary and only "chalky white ice" discovered.

ARGENTINA or ARGENTINE REPUBLIC. The second largest state in South America, on the extreme south of the continent. About one third is under cultivation, the remainder being mountain, water, or arid districts; one fifth is irrigated. The magnificent river system of the La Plata waters the eastern section, but otherwise water is lacking. The principal industry is agriculture, producing wheat, maize, flax, cotton, sugar, varied fruits, creamery products, and there are enormous herds of cattle, sheep, goats, swine, etc., with a heavy percentage of pedigree stock. Minerals: gold, silver, copper, iron, bismuth, lead, galena, lime, salt, some coal and petroleum. Chief imports: machinery, tools, lubricating and illuminating oils, lumber, linens, hemp, jute; chief exports: wool, hides and skins, wheat, frozen mutton, dried beef, and fruits. The principal port, and the capital, is Buenos Aires, with Rosario, La Plata, Cordoba, Tucuman, Mendoza, Santa Fe, and Parana leading cities.

ARIZONA. A Western state in the arid region of the southwest, with only one per cent. of its area water, although the Colorado river divides it diagonally. The upper section is an elevated plateau, and the other is a low elevation. The Colorado runs mainly between steep-sided gorges. Irrigation is accomplishing much, and, while agriculture is limited, stock raising is steadily increasing on the northern plateau. The principal crops are wheat, cotton, alfalfa, barley, and in the south, fruits are also grown, while successful experiments have been made with Egyptian cotton and the date palm. The mineral product is important, rich copper and silver deposits, gold, coal, lead, platinum, quicksilver, tin, nickel, iron, salt, gypsum, with opals, garnets, turquoise, onyx, and sapphires in limited quantities. The capital is Phoenix.

ARKANSAS. A Southern state in the flood plain devoted to agriculture, with nearly one half improved lands. A rich, deep soil, growing maize, wheat, oats, potatoes, forage, cotton, some tobacco, and a wide variety of fruits. The live stock industry is extensive. Forests cover many parts of the state. Its minerals include coal, manganese, lead, novaculite (for whetstones), phosphate rock, bauxite, limestone, sandstone, granite, slate, asphalt, mineral waters, and natural gas. It is famed for its sulphur springs. Its manufactures are lumber and cottonseed oil and cake. The capital is Little Rock.

ASCENSION ISLAND. An isolated island in the Atlantic Ocean. It is of volcanic origin, and has an area of about 35 square miles, one half of which is under cultivation. It is a British coaling and victualing station for the navy.

ASIA. The largest of the great divisions of the globe, comprising about one third of the land surface, and extending from the Arctic Ocean on the north to the Indian Ocean on the south, and from the Pacific Ocean on the east to Europe on the west. It is a territory of extremes, with vast lowlands, immense table-lands, high mountain ranges, fertile valleys, and noxious jungles, ranging from tropical fertility to perennial snow or arid regions. The plateau called the "Roof of the World" is found in the Pamir

Mountains, tying together the mightiest of mountain ranges. Three huge ranges rise above the plateau of Tibet: Kuenlun on the north, Karokoram crosses Tibet, and the Himalayas are on the south. Towards the northeast extends a long range of mountains, under several names, to Bering Sea. The Suliman range extends to the coast and cuts off India from southwestern Asia. The high Hindu Kush chain stretches westward along a border of the plateau of Iran. There are seven great river systems, in order of length, the Obi, Yenesei, Yangtze, Lena, Amur, Hoang-ho, Indus, and Ganges-Brahmaputra. Other streams of magnitude are the famed Euphrates and Tigris.

ATLANTIC OCEAN. This body of water lies between the Arctic Ocean on the north, the Antarctic on the south, between Europe and Africa on the east, and the two Americas on the west. Without its arms and inlets it covers about 34,700,000 square miles, being about 9,000 miles from north to south. The minimum width is between Cape Palmas and Cape San Roque, 1,900 miles, the average width being about 3,000 miles. The average depth between 50° N. and 50° S. is 13,000 feet, with shallows north and south of these limits; greatest depth found by the *Challenger* 27,366 feet, north of Porto Rico. The floor of the ocean temperature varies from 32° F. to 37° F. The average surface water temperature varies from 82° F. in the tropics to 32° F. in polar regions. The speed of ocean currents varies from 20 to 75 miles a day.

ATLAS MOUNTAINS. The great northern system of Africa, stretching northeastward 1,400 miles from Morocco to Tunis, is an irregular mass of land, highest in Morocco. The slopes on the north, west, and south are covered with vast forests of pine, oak, cork, white poplar, and wild olive. The valleys are well watered and capable of high cultivation; rich but unworked mineral deposits are here.

AUSTRALIA. An English commonwealth. The island continent to the southeast of Asia. It is bordered east, north, and west by a belt of fertile land from 30 to 300 miles wide, or about one third of the total area. Beyond this belt lie mountain ranges and divides, and beyond the mountains a vast table-land, sadly lacking in waterways and rainfall, slopes to the cliffs of the shore line. The Murray-Darling is the only large river system. There are many short rivers too shallow for navigation, and on the south are 1,000 miles of coast with no river flowing to the sea. The Murray-Darling is navigable for 1,700 miles, and the Murrumbidgee for 500 miles. The short rivers and inland lakes will be used later for irrigation. There is a large area under cultivation, of which half is wheat. Ranching and agriculture are the two great industries, and there are millions of farm animals, of which over 80 per cent. are sheep. Principal imports are agricultural implements, cars, machinery, cotton, drugs, timber, and oils; chief exports: wheat, wool, gold, copper, silver, frozen meats, butter, hides, tin; minerals: gold, silver, lead, iron, coal, and tin. Pearl fishing is valuable on the north coast. The country is divided into six original states: New South Wales, its capital Sydney, the chief port and a fine naval station; Victoria, Melbourne as capital, the grandest Australian city; Queensland, Brisbane as capital, strong in industrial enterprise; South Australia, its capital Adelaide, the "suburban home" city, and Port Adelaide close by; West Australia, capital Perth; and the island of Tasmania, capital Hobart, the "English" city of the continent, with Launceston its chief port. The new federal capital is in Yass-Canberra.

AUSTRIA. The republic of Austria was proclaimed in 1918, with Vienna as its capital. It was a part of the Austria-Hungarian Empire that was divided up after the late war. The area was reduced from some 115,000 square miles to 32,000 with a corresponding decrease in population. The territory taken away from the Empire includes: Transylvania and part of Bukovina which went to Rumania, Galicia which Poland got, Dalmatia, Bosnia, and Herzegovina now belonging to Jugo-Slavia and Bohemia and Moravia which was absorbed by Czecho-Slovakia. Klagenfurt, to the south, was left to a plebiscite and voted to remain with Austria. Trieste went to Italy. The area remaining is very mountainous to the west, where it runs into the Alps, but the east is mostly in the Central plain, called there the Vienna basin, and quite fertile.

In the west we find grazing an important industry, together with much forest land, especially the chestnut timber. Mineral products in the mountains include iron, lignite, lead, zinc, and mercury. In the Vienna basin we find diversified farming, the crops consisting of potatoes, barley, turnips, rye, oats, and wheat. Textile manufacturing still remains the most important with some tobacco and piano manufacturing. The exports are ores, timber, sugar, fruit, furniture and chemicals. Vienna is the capital and the chief city commercially and industrially.

AZERBAIJAN. A Soviet republic bordering on the Caspian Sea, south of the Caucasus Mountains and east of Georgia, composed of two former Russian provinces, Baku and Yelisavetpal, with an area of approximately 34,000 square miles. The country is primarily agricultural, raising cereal crops, cotton and cattle. There is much fishing in the Caspian Sea. Baku, the chief city, is one of the world's greatest oil producing regions, much of the product being pumped to Batum on the Black Sea and thence distributed to Europe and Egypt by boat.

AZORES. A group of nine Atlantic Ocean islands belonging to Portugal. The largest are St. Michael's, Pico, and Terceira. Angra and Fayal are the two principal harbors, but neither can be called good. The climate is very temperate, the soil fertile, and the principal products maize, pineapples, olives, oranges, grapes, wine, and bananas, all heavily exported. St. Michael's and Fayal are coaling stations. The capital is Ponta Delgada.

AZOF, SEA OF. An inland lake formed by the Crimean peninsula projecting into the Black Sea, and nearly cut off from it. The water is almost fresh and very shallow, but fish are abundant. The Don river flows into it, and Taganrog is its port.

BAHREIN ISLANDS. A small group of islands in the Persian Gulf, under a British protectorate. The capital and commercial center is Manameh. The islands are famous for their pearl fisheries. Quantities of tropical fruits are produced, figs and dates, also grain, cattle, a remarkably fine breed of donkeys, and reed mats.

BALKAN MOUNTAINS. A series of mountain ridges in southeastern Europe extending east and west throughout the country, highest in the west and crossed by more than 30 passes, Shipka Pass being the most noted. The valleys to the south are very fertile, grapes, rice, cotton, tobacco, silk, and roses are grown; at the north wheat, rice, and other grains, and cattle are raised and good timber found.

BALTIC SEA. The great gulf or inland sea bordered by Denmark, Germany, Russia, and Sweden, 850 to 900 miles long, 100 to 200 miles wide, including the gulfs of Bothnia and Finland. Ice hinders navigation three to five months yearly; more than 250 rivers enter it, which, with the lakes, drain about one fifth of all Europe. Several large canals connect with the North Sea, the Kaiser Wilhelm being the largest, and of great value to the commerce of northern Europe. The waters are not very salt. Storms are frequent, causing great losses in shipping, while easterly winds are dangerous, producing huge tidal waves. The greatest ports are Copenhagen, Kiel, Lubeck, Riga, and Stockholm.

BARBARY STATES. These comprise Morocco, Algeria, Tunis, Tripoli, Fezzan, and Barca in northern Africa.

BAVARIA. A state in the new German Republic. It is a mountainous country, almost all its boundary lines being mountain ranges. The surface of the interior is an elevated plateau sloping northward, intersected by low hills and valleys. It is drained by the Danube, the Main, and their tributaries. An important canal connects the tributaries of the Danube and the Rhine, thereby uniting the North and the Black seas. Agriculture is carried to a degree of perfection very rarely surpassed. In almost every department of the industry associations coöperatively buy seeds and machinery, store grain, market products, insure buildings and crops, superintend the improved breeding of domestic animals, etc. Crops: grapes, hay, rye, oats, barley, wheat, potatoes, hops, tobacco, beets, and rape seed. Stock raising is practically the staple industry, Bavaria being the largest cattle-raising country in the German Republic. About 33 per cent. of the total area is forest land, mostly pine and fir, about one half of which is owned by private individuals. Manufactures: malted liquors (it is the largest beer-producing country in the world), coarse linens, woolens, tobacco products, chemicals, earthenware, glass, agricultural implements, leather goods, and wooden ware. Minerals: salt, a government monopoly; coal and iron almost universally mined; some graphite, the famous lithographic stone of Solnhofen, and useful earths. The capital is Munich.

BELGIUM. A small independent European state, having much low-lying level land, of which 60 per cent. is under cultivation. Is well watered, and has good navigable waters on the Meuse and Scheldt, both

of which pass through the country. Mining, extensive manufacturing, and agriculture are the leading industries. Crops: rye, oats, wheat, potatoes, sugar beets, etc. There are large numbers of cattle and hogs, and some good draft horses are produced. Imports: grain, timber, wool, and flax; exports: machinery, firearms, iron, steel, linen, textiles, lace, marble, hops, fruit, and coal. Brussels is the capital, famed as one of the loveliest cities of Europe. Antwerp is the principal seaport. Liege is famous for its ordnance factories; Ghent for its gold and silver goods and its shipping trade; Hainaut, Brabant, Namur, and Val Saint Lambert for their unrivaled glassware; and Charleroi for nails. In 1908 Belgium annexed the Congo Independent State in Africa. Exports: rubber, ivory, white copal, palm nuts, palm oil, cocoa, and crude gold. It has access by water to the river Nile.

BERING SEA. In the extreme northern part of the Pacific Ocean connected by Bering Strait with the Arctic Ocean and extending from Alaska to Asia. The northern half is very shallow, less than 200 feet deep. It contains a few islands famous for seal fisheries. Bering Strait, the narrowest part, about 40 miles wide, lies between East Cape in Asia and Cape Prince of Wales in America. Three uninhabited islands are found about midway. The water is more shallow towards America.

BERMUDA ISLANDS. A group of about 360 islands, 15 or 16 of which are inhabited. Of coralline formation and surrounded by reefs, east southeast of Cape Hatteras, in the Atlantic Ocean. An English possession of great strategic importance and strongly fortified. Imports are mainly food supplies, cotton goods, and apparel: exports: onions, potatoes, early vegetables, lily bulbs, and arrowroot. The principal towns are Hamilton and St. George.

BHUTAN. An independent state of India in the eastern Himalayas. The surface is mountainous, but some parts of the territory are fertile, producing millet, rice, wheat, etc., but not sufficient for the home demand; forests cover the central part. Cattle raising is profitable, and a highly esteemed breed of ponies is exported. The manufactures comprise coarse cloths, silks, arms and musk, highly-tempered swords, lac, chowries, and wax. The capital is Punakha, a strong natural fortress where court is held during the winter; the summer capital is Tasichozong, where is the chief monastry.

BLACK SEA. An inland sea lying between eastern Europe and Asia, connected with the Mediterranean by the Bosphorus, Sea of Marmora, and the Dardanelles; it drains nearly one fourth of Europe, is very deep, has one island; its coasts are high, with good harbors except between the mouths of the Danube and the Crimea. Many large rivers make the water so fresh that it freezes easily. It has no tide, but very strong currents. It is of great importance commercially to Russia and all bordering territory. Odessa is the chief port.

BLUE RIDGE MOUNTAINS. The most easterly range of the Appalachian system in Virginia, North Carolina, South Carolina, Georgia, and Alabama.

BOLIVIA. A South American republic of many provinces united. One of the highest regions in America. The surface ranges from high plateaus, cool, healthful, and rich in minerals, to deep valleys semi-tropical or temperate in character. The north and east are largely unexplored and are respectively rich in rubber and grazing lands. Agriculture only supplies the home demand, and the produce is mainly oats, rice, barley, maize, cotton, indigo, cacao, and rubber. The country is watered by rivers belonging to the basins of the Paraguay and the Madeira, and many of these are navigable. There are practically no manufactures. Imports: apparel, machinery, hardware, and provisions. There being no seacoast, exports go through foreign countries, mainly transported by mule trains; the exports comprise large quantities of tin, rubber, silver, copper, gold, bismuth, wolfram, lead, and antimony, wool, hides, and cattle. There are large forests of ebony, mahogany, rosewood, and cork. The capital is Sucre, but the most important town is La Paz.

BOOTHIA FELIX. A peninsula forming the most northern point of the American continent. It is about 150 miles long by 50 miles wide. Discovered by Sir John Ross (1829–1833), and named after Sir Felix Booth, the greatest contributor to the expedition. Sir James Clark Ross discovered the magnetic pole near Cape Adelaide, on the west coast (June 1, 1831).

BORNEO. The fifth largest island in the world, situated in the East Indian Archipelago. It has been little explored. Its highest peak is Kinabalu, about 13,700 feet. It is rich in forest products, ebony, sandalwood, and teak, and has important industries in gold, antimony, mineral oil, and coal. It exports timber, sago, cocoanuts, rice, gums, rubber, coffee, tobacco, fruits, gutta-percha, nutmegs, spices, rattans, seed pearls, beche de mer, the edible nests of the swallow, and palm products in variety. British North Borneo is in the north, with a chief port of Sandakan, the adjacent districts of Brunei and Sarawak being under British protection. The southern and east part is Dutch Borneo, with Pontianak, Sambas, and Sintang the principal cities.

BOSPOROUS. The narrow channel connecting the Black Sea with the Sea of Marmora and separating Europe from Asia. It is about 18 miles long and is under the control of Turkey which keeps Russia from having a port on the Mediterranean.

BRAZIL. The largest country in South America; an important republic. North and west the surface is plains, and south and east are the Brazilian highlands, supporting three mountain ranges. The great river system of the Amazon, with its magnificent navigation facilities, drains the plains. The climate is almost entirely tropical or subtropical. The highlands are dry and steppe-like; the lowlands on the equator are deluged with trade-wind rains; neither district is much populated. The coastal zone is fairly well populated, and here agriculture is the leading industry, although Brazil has a lower percentage of ground under cultivaton than elsewhere in the world. There are vast mineral resources, but the product is small,—iron, gold, diamonds, silver, petroleum, manganese, monazite (important in Welsbach mantles), mica, etc. Chief imports: foodstuffs, machinery, and provisions; chief exports: coffee, rubber, cotton, hides, sugar, tobacco, brazil nuts, yams, fruits, maize, bananas, black beans, rice, and arrowroot. There are immense forests of mahogany, logwood, and rosewood. It is the largest exporter of coffee and rubber in the world. Many of the railways were built to convey the coffee, and much of the rubber is transhipped from Bolivia. The capital is Rio de Janeiro, with its marvelous harbor about 30 miles in length, and principal cities are Pernambuco, shipping sugar and cotton; Bahia, tobacco; Para, rubber; Sao Paulo, and others.

BRITISH AFRICA. A widespread series of British possessions and protectorates. Basutoland is an elevated but rugged plateau northeast of Cape Colony, well watered, and probably the best grain-producing and grazing area in South Africa; also producing wool, wheat, maize, and having favorable indications of iron, copper, and coal. Has good roads and a great future. The capital is Maseru. Bechuanaland, lying north of the Transvaal, has growing industries of cattle raising and agriculture, and is traversed by the railway from Kimberley to Mafeking. Four provinces joined together, Cape Colony, Orange Free State, Natal and Transvaal form The Union of South Africa. The government is similar to that of Canada. Cape Colony has a considerable fertile area devoted to agriculture, producing wheat, oats, barley, maize, rye, grapes, wine, wool, and mohair, besides farm animals. Imports: apparel and provisions; exports: gold, diamonds, wool, hair (Angora), ostrich feathers, hides, and copper. The Orange River Colony (Orange Free State) is a magnificent grazing country, especially for sheep. It is developing rapidly along scientific lines of farming, dairying, forestry, and stock raising. Has great future in irrigation schemes of immense magnitude. Produces wheat, oats, maize, and tobacco. Has rich minerals and exports diamonds, coal, and some salt. Natal is an important agricultural section, producing and exporting sugar, wattle bark (varied acacia barks used in tanning), maize, oats, citrus fruits, while sugar beets and vegetables are largely grown. It has a steadily increasing wool product. There are large and valuable forests in Zululand. Rich mineral resources in coal, gold, asbestos, copper, fire clay, graphite, gypsum, iron, lead, silver, phosphate deposits, marble, nickel, and others. The Transvaal is a fine agricultural and stock raising territory as yet undeveloped. An interior plateau extends from the northern Drakensberg and Lebombo, across which stretches the famous gold-bearing Witwaterstrand. It is well watered, and drained by the Limpopo, the Vaal, the Olifant, and Komati, but none of the rivers are navigable. The large herds of farm animals are constantly improved by imported stock. Minerals: gold, coal, diamonds, lime, lead, tin, copper, and chrome iron. Imports: apparel, machinery, chemicals, and dynamite; exports: gold, diamonds, wool, horses, and skins. The capital is Pretoria. Nyasaland Protectorate (British

Central Africa). An important native division producing much coffee, tobacco, beeswax, rubber, peanuts, tea, some cotton, and farm animals for export. Has trade ports of Port Herald, Chiromo, and Kotakota connecting with the Lower Shiré and Lake Nyasa. The capital is Zomba, and Blantyre is the largest town. Rhodesia, a territory named for Cecil Rhodes, divided into Southern Rhodesia, and Northwestern and Northeastern Rhodesia. An agricultural and mineral section. Fine grazing land for cattle. Crops of wheat, oats, European fruits, fiber, coffee, and cotton. Chief exports: gold, gold concentrates, hides and skins, chrome iron, and copper ore, tungsten, and zinc ore. Other minerals are silver, lead, coal, diamonds, and some asbestos and antimony. Somaliland Protectorate. On the Gulf of Aden, and is rapidly developing. Chief exports: skins and hides, ostrich feathers, gums, cattle, and sheep. Transport is by camels. Capital is Berbera. Uganda Protectorate has a large area of extremely fertile land, producing sugar, chillies, ghee, maize, peanuts, bananas, sugar cane, and tobacco. Well watered by the great equatorial lake systems, with steamship route to Khartum and a railway to Mombasa. Exports: goat skins, hides, rubber, ivory, chillies, cattle, and fibers. The capital is Uganda. Zanzibar Protectorate exports large quantities of cloves, native textiles, copra, and ivory, with some rubber and gums. There is wireless telegraphy between the islands of Zanzibar and Pemba. West African Colonies and Protectorate comprise Northern and Southern Nigeria, the Gold Coast Colony, with Ashanti and Northern Territories, Sierra Leone and Gambia Colonies and Protectorates, all rapidly developing. Roads are being made, bridges built, and navigation fostered on the Niger and its tributaries. Products of this division are palm oil, palm kernels, rubber, peanuts, hides, ostrich feathers, capsicum, kola nuts, drugs, cotton, tobacco, tanned goat and sheep skins, cacao, gums, cassava, plantains, and ginger. There are rich deposits of tin, and considerable iron, silver, salt, manganese, balena, lignite, and monazite. Kenya Colony and protectorate, south of Abyssinia and bordering on the Indian Ocean, is hot and wet near the coast. None but natives can live there who produce sugar, rice, sweet potatoes, cotton and cocoanuts. In the interior, which is the highland region, grain, cotton and coffee are produced. Mombasa, the seaport, exports grains, coffee, oils and hides and skins. Nairobi is the capital, taken from the Germans and mandated by the League of Nations to the British Government. Tanganyiki Territory on the east coast south of Kenya has great forest areas of ebony and bamboo, and produces sisal hemp, coffee, cotton, rubber and cattle. The mineral products are gold, iron, copper, lead, coal and mica. The capital and chief port is Dar es Salaam, exporting hides, ivory, cotton, copra, wax, sisal and rubber. South West Africa, on the west coast, south of Angola, is principally a stock raising area with big deposits of diamonds and copper. Cammeroon on the west coast north of the French Congo produces much cocoa and palm oil. It has valuable timber lands of ebony and in its mines has gold and iron. Buea is the chief port. Togoland, between the gold coast colony on the west and French Dahomey on the east, is relatively poor, the products being only oils, cocoa and cotton.

BRITISH COLUMBIA. A Canadian province nearly twice the size of France, divided by parallel ranges of mountains stretching from Alberta to the Pacific, leaving long strips of exceedingly fertile land, well sheltered, and is watered by the Saskatchewan, Athabasca, and Peace rivers, and tributaries of the Frazier and Columbia. The province has a great agricultural future, and is rapidly developing. There are fine grazing lands and large areas of forests. Products: wheat, barley, hops, butter and cheese, apples and small fruits, vegetables, poultry, and stock. Has important salmon fishing, and an ocean front of about 7,000 miles. Mining is at present the great industry, and the mineral deposits include gold, coal, copper, and lead. The capital is Victoria, and Vancouver is the largest city.

BRITISH EMPIRE. Includes the British Isles and all the British colonies, representing one fifth of the whole land surface of the globe, and forming the greatest nation in the world, rivaled only by Russia in its extent of territory.

BRITISH GUIANA. A British colony in the western part of Guiana, a territory in the northeastern part of South America. It includes the settlements of Demerara, Essequibo, and Berbice; only the alluvial stretch along the coast has been really developed. Only a small part is under cultivation, of which about one half produces sugar cane. There are rich deposits of gold, and many diamonds are mined. Imports: flour, tissues, tobacco manufactures, machinery, fertilizer, fish, coal, hardware, provisions; exports: sugar, gold, rum, molasses, molasquit, balata, rice, wood, diamonds. The capital is Georgetown.

BRITISH HONDURAS. A crown colony of Great Britain in Central America, on the Caribbean Sea. There is good cattle land but agriculture is primitive, and much of the trade is transit. Exports: mahogany, logwood, cedar, bananas, cocoanuts, coffee, and plantains. The capital is Belize.

BULGARIA. A kingdom of the Balkan peninsula. Agriculture is the prevailing industry, nearly half the land area being in the hands of small proprietors, the remainder being forest. Crops: wheat, tobacco, grapes, cotton, rice. Minerals: extensive coal and iron deposits, gold, silver, lead, manganese, copper, and stone. Imports: textiles, machinery, oils, hides, provisions, and groceries; exports: wheat, wine, tobacco, silk cocoons, attar of roses, cotton, and rice. Manufactures include woolen goods, cottons, cords, and cigarettes. The capital is Sofia.

CALIFORNIA. An important Western state, the second largest in the Union. Magnificently fertile soil in the valley between the Sierras and the Coastal Range, forming one of the finest agricultural and fruit districts in the world. Vast irrigation development is in process. Products: apples, pears, plums, grapes, olives, citrus fruits, figs, roses, sugar beets, wheat, barley, hay, potatoes, and other vegetables. The grain, hay, and potato products are worth annually four times the gold product. There is an enormous area of commercial timber. It has much grazing territory for sheep. Minerals: gold, copper, coal, quicksilver (one half the world's supply), tin, borax, and salt. Manufacturing: mining machinery and sugar refining, flour and grist milling, shipbuilding, etc. The capital is Sacramento. Los Angeles is the largest city and has constructed an artificial harbor whereas San Francisco, the next city in size has one of the best natural harbors on the coast.

CANADA. The Dominion comprising the northern part of North America. An English commonwealth, vast in extent, of greater area than the United States, possessing illimitable natural resources, and developing phenomenally. A broken surface of low elevation is in the east; wide interior plains and mountains in the west; a fertile, well-watered, well-timbered land. Products: wheat, barley, flax, oats, pulse, roots, tobacco, apples, grapes, butter and cheese, lumber, and fish. The finest agricultural area is Manitoba westward from Winnipeg to beyond Regina. Minerals: gold, coal, copper, nickel, silver, cement, lead, asbestos, petroleum, and iron. Imports: iron and steel, manufactures of wool, iron ore, cotton, and drugs; exports: manufactures of wood, wheat, cheese, bacon, silver, flour, cattle, and fruits. Divided as follows: Provinces, Alberta, British Columbia, Manitoba, New Brunswick, Nova Scotia, Ontario, Prince Edward Island, Quebec, and Saskatchewan; Yukon and Northwest territories. Franklin, Keewatin, Mackenzie, and Ungava are districts. Principal cities: Montreal, Quebec, Toronto, Winnipeg, Ottawa (capital and seat of government), and Vancouver.

CANARY ISLANDS. A group in the Atlantic Ocean, off the northwest coast of Africa, constituting a province of Spain. Products: tomatoes, onions, bananas, potatoes, and the cochineal insect, now almost displaced by anilin. Imports: coal, cottons, woolens, fertilizer, and machinery. The capital is Santa Cruz de Tenerife, and Ciudad de las Palmas is an important fortified city.

CAPES. The important capes of the world are: Cape Breton, on the east coast of Cape Breton Island, Nova Scotia; Cape Clear, the most southern point of Ireland, generally the first land seen by transatlantic travelers; Cape Chelyuskin, the most northern cape of Asia; Cape Cod, the southeastern point of Massachusetts; Cape Farewell, the southern extremity of Greenland; Cape Finisterre, the northwest extremity of Spain; Cape Hatteras, a dangerous point, famed for bad weather, off North Carolina; Cape Horn, the most southerly point of South America; Cape Mendocino, the extreme western point of California; Cape Nome, on the west of Alaska; Cape of Good Hope in South Africa, but Cape Agulhas is the most southern point; Cape Prince of Wales, the point of Alaska nearest Siberia; Cape Race, the southeast extremity of Newfoundland; Cape Sable, the south point of Florida; Cape Verde, the most westerly point of Africa; East Cape, the most eastern point of Siberia; and North Cape, the most northern point of Norway.

CAPE VERDE ISLANDS. A Portugese group west of Africa, Santiago being the largest and most important. Products: coffee, medicinal products, indigo, and fruits, with turtle and whale fishing along the coasts. Imports: manufactures of cotton, wool, and machinery; exports: hides, coffee, and salt. The capital is Praia.

CARIBBEAN SEA. A partly inclosed sea lying between the West Indies and Central and South America, connected with the Gulf of Mexico by Yucatan Channel.

It is very deep, and its waters are affected by ocean currents. Few rivers of importance drain into it, and there are few islands.

CAROLINE ISLANDS. Coral group in North Pacific, belonging to Japan, except Guam, which belongs to the United States. Imports: cotton, machinery, hardware, and provisions; exports: copra, sugar, and fruit. It has valuable but undeveloped mineral resources.

CARPATHIANS. A circular system of mountains separating Hungary from Moravia, Silesia, Galicia, Bukowina, and Roumania, that are noted for deposits of gold, silver, lead, copper, and other ores, which have been worked for centuries. Containing more mineral wealth than any other range in Europe. Rich in forests.

CASCADE MOUNTAINS. A chain of mountains continuous with the Sierra Nevadas, running through Oregon, Washington, and British Columbia, with highest point Mt. Shasta, 14,380 feet. It takes its name from the cascades of the Columbia. Throughout it is heavily wooded.

CASPIAN SEA. The largest inland sea or great salt lake in the world, lying on the boundary between Europe and Asia. It is very shallow in the north, where the water is less salt than the ocean because of the rivers draining into it. It is of immense value to the Russian Empire, as it forms a waterway with the Volga river between the Asiatic and European provinces. Canals connect it with the Baltic Sea, and it has immense salmon and sturgeon fisheries. Astrakhan is the chief port.

CAUCASUS. A great mountain chain extending through the isthmus between the Black and Caspian seas, sometimes treated as the boundary line between Europe and Asia. Parallel chains connected by elevated plateaus containing narrow but deep fissures form the range. The highest peaks are in the center, Mt. Elbruz being the highest. It is densely wooded in parts with great forests of oak, beech, ash, maple, and walnut. Grain is cultivated to a great height, and the lower valleys produce rice, tobacco, cotton.

CEYLON. A large island south of India; an English crown colony. About one fifth of its area is devoted to agriculture and fine grazing pastures. Products: rice and other grains, tea, cocoanuts, rubber, cinnamon, cinchona, cacao, coffee, tobacco, nuts, spices, breadfruit, camphor, fruits, and vegetables. There are large numbers of farm animals. Minerals: large deposits of plumbago, gold, monazite, mica, moonstones, rubies, cat's-eyes, sapphires, etc., there being over 3,000 gem mines in operation; also pearl fisheries, which are a state monopoly. Imports: cotton goods, salt fish, coal, rice, kerosene, hardware, and wines; exports: tea, cocoanuts, rubber, nuts, coffee, spices, plumbago, and cinchona. The capital is **Colombo.**

CHILE or **CHILI.** A South American republic between the Andes and the Pacific. It is about 2,600 miles long, but only 40 to 200 wide. The northern division is a desert, but the great valley immediately below is noted for some of the richest land in the world. Products: wheat, maize, barley, oats, beans, hemp, potatoes, fruits, dairy products, and vegetables. Minerals are the most valuable product: nitrate of soda, coal, gold, copper, cobalt, manganese, borax, salt, sulphur, and quicksilver; also guano. Imports: textiles, machinery, lumber, and illuminating oils; exports: mainly nitrate of soda. The capital is Santiago and the chief port Valparaiso, Iquique being the great nitrate port, and Concepcion having the finest harbor at Talcahuano, eight miles distant.

CHINA. An enormous territory in eastern and central Asia, occupying about one fourth of the continent. It is second of the great republics in size. China proper is about one half the size of the United States without Alaska, yet it contains five times as many people. It is the most populous country, containing one quarter of the world's people. It has a coast line of nearly 5,000 miles, with many inlets and seas favorable to commerce. The surface resembles that of the United States, having a dry interior plateau with lofty mountain ranges to the west and east. It also has a vast plain through which flow the long rivers, Hoang-ho and Yangtze. The staple industry is agriculture, small freehold farms worked with primitive implements and with much irrigation. Products: wheat, barley, maize, millet, peas, and beans in the north, and rice, sugar, cotton, indigo, fruits, and tea in the west and south. There are few forests but much bamboo. The silkworm culture produces nearly one third of the raw silk of the world, being second to Japan. Opium culture is restricted, and is expected to die out. The native manufactures are silk, cotton, linen, bamboo, clay (porcelain), wood, metal work, ivory and wood carving, embroidery, lacquer ware, bronze casting, and, of late years, bricks, matches, guns, cannon, munitions of war, iron, etc., the country being rapidly modernized in several sections. Minerals: gold, copper, coal, silver, quicksilver, tin, salt, and natural gas. Imports: cotton goods, rice, sugar, oils, metals, machinery, and opium; exports: raw silk, tea, raw cotton, hides, and beans. Its dependencies include Manchuria, Mongolia, Tibet, and Chinese Turkestan. Tibet is the highest and largest plateau in the world, cold and mostly sterile. It is the source of five great Asiatic rivers. Agriculture and stock raising are carried on under great hardships, the crops being barley, that most hardy of cereals, wheat, buckwheat, potatoes, turnips, radishes, apples, and, in the south, apricots, peaches, pomegranates, etc. Noted for its swords, guns, saddles, teapots, and bells. Believed to be extremely rich in minerals,—gold, silver, iron, coal, lapis lazuli, and gems,—but is "shut in" from the rest of the world. Chinese Turkestan. A dependency of China, isolated and forbidding. An elevated desert plateau surrounded by lofty ranges and watered by the Tarim. At foot of the frontier ranges are fertile oases where are conducted agriculture, stock raising, manufactures of copper, carpets, felt, leather, cotton, silk, and animal products, mainly to supply and trade with the caravans of the great route. Rich in minerals, but almost totally unexplored. The capital of China is **Nanking,** and the principal ports are **Canton, Tientsin, Chungking, Shanghai,** and **Hankau.**

COLOMBIA. A South American republic adjoining Panama. It has lofty mountains in the west and vast plains in the east, having fertile soil. Products: coffee, tobacco, cacao, cotton, sugar, wheat, maize, bananas, plantains, dyewoods, rich lumber. Wild rubber trees are now being cultivated. Minerals: very rich gold and silver deposits, copper, platinum, lead, cinnabar (14 mines), manganese, emeralds (32 mines), coal, iron, limestone, sand, fire clay, salt. There are rich pearl fisheries. Imports: cotton goods, machinery and metal goods, drugs, and provisions; exports: coffee, minerals, cattle, tobacco, and ivory. Bogota is the capital, connected by boat and mule with the coast, and it has two grand cathedrals. Principal cities are **Barranquilla, Cartagena, Medellin.**

COLORADO. A Western state, traversed from north to south by the Rocky Mountains, containing every variety of surface from level plains to gigantic peaks, of which within the state are more than 100 peaks exceeding 13,000 feet, Mt. Massive being the highest. The central region with its parks, cañons, hot springs, dryness of air, and rich mineral deposits have made Colorado famous. Many important rivers rise in this state—the Colorado, Mississippi, and Rio Grande basins occupying the slopes. Irrigation is extensively employed so that agriculture is remunerative; cereals, hay, vegetables, and fruits are widely raised. Stock raising is more important than farming; mining is the chief industry. The discovery of gold near Pike's Peak led to the first settlement; Cripple Creek is now the principal gold region. Other minerals: silver, lead, coal, copper, zinc, petroleum, cement, fire clay, and manganese. Manufactures: steel, beet sugar, machinery, cars, liquors, butter, cheese, canned meats. Denver is the capital and center of the live stock trade; Pueblo is the second city, noted for its steel works.

CONGO or **KONGO.** An African free state in the Congo Basin founded by King Leopold II. of Belgium and placed under his jurisdiction. Its surface is a depressed plateau, half covered with forests, the remainder being low-lying savannas and arable lands; well watered by the Congo river; forests contain many rubber and other gum yielding trees. Agricultural possibilities are great, but the climate is unhealthful to whites. Products: coffee, cotton, yams, papaws, pineapples, cassava, rice, maize, peanuts, sweet potatoes, bananas, beans, rubber, tobacco, sorghum, and ivory. Trade is hampered by rapids, rendering river communication to the coast impracticable. A railway connects with Stanley Pool and its steamboat traffic. The capital is **Boma.**

CONGO RIVER. The largest river in Africa, with a volume of water far exceeding that of the Mississippi. Flows north (as Luapula) from Lake Bangweolo to Lake Moero, then north and northwest as the Livingstone, and then southwest to the Atlantic as the Congo. With its tributaries it forms a navigable waterway, obstructed by falls and rapids. Above Leopoldville it is navigable for 1,000 miles.

CONNECTICUT. A well-watered, important New England state. The highland region, which commences in Vermont, descends into this state at a considerable height, slowly loses its mountainous character, and ends with low hills as Long Island Sound is approached. While the river valleys are fertile, producing much valuable tobacco and other crops, the leading industry is manufacturing, due to abundant water power, good harbors, navigable rivers, and nearness to large cities.

The manufactures are firearms, ammunition, rubber goods, watches, clocks, sewing machines, textiles, hardware, silks, silver-plated ware, brass goods. The oldest iron mines in the country are here, and other minerals are granite, marble, trap rock, limestone, clay products (bricks, tiles, etc.), quartz, infusorial earth, and tungsten ore. The principal cities are New Haven (the home of Yale University); Hartford, the capital; Bridgeport, Waterbury and New Britain.

COSTA RICA. A Central American state between Nicaragua and Panama. A good agricultural country, but hampered by lack of population and transportation facilities. Products: bananas (the main crop), coffee, cacao, maize, sugar, rice, potatoes, valuable woods. Live stock raising is important. Imports: mainly textiles, machinery, steel, and provisions; exports: bananas, coffee, and gold. The capital is San Jose, and the Caribbean port is Port Limon; the Pacific port is Puntarenas.

CRETE. An autonomous state, returned to Greece in 1913. An island in the Mediterranean. Products: olive oil, grapes, oranges, lemons, and other fruits, chestnuts, and silks. The capital is Canea, and the ports are Candia, Cenea, and Retimo.

CUBA. Largest of the West Indies; an independent republic under the protection of the United States; with a surface of plains, rolling uplands, and forest regions, the latter being estimated to cover nearly one half the island. An agricultural country, with exceedingly rich and fertile soil, in many small holdings. Products: sugar, tobacco (the maximum crop is very large), coffee, oranges, cacao, cereals, vegetables, bananas, pineapples, lemons, limes, cocoanuts, with valuable fish. Over half the cultivated area is in sugar. There are large forests of mahogany, cedar, ebony, dyewoods, and gum producing trees. Minerals: copper, manganese, iron, some gold, silver, lead, and asphalt, but all are little worked. Imports: textiles, provisions, machinery, manufactures, coal, live stock; exports: large quantities of sugar, alcohol, tobacco, cigars, molasses, wines, fruits, iron ore, mahogany and other cabinet woods, gums, resins, and oils. The capital is Havana, and the principal towns Santiago de Cuba, Cienfuegos, Camaguey.

CYPRUS. Third largest island in the Mediterranean, progressing steadily under the administration of Great Britain. Has a large area of irrigation works. Essentially agricultural, with one third of the land under cultivation. Products: wheat, barley, oats, olives, cotton, large quantities of grapes, carobs, fruits, flaxseed, silk, cheese, wool, hides, and some oil of thyme and sponges. Minerals: abundant gypsum and terra umbra, marble, copper, asbestos. Imports: cotton and woolen manufactures, provisions, iron, leather, petroleum, lumber; exports: wheat, barley, carobs, raisins, silk cocoons, hides, wine, wool, flour. The capital is Nicosia, the principal ports Larnaca and Limasol.

CZECHO-SLOVAKIA. The Czecho-Slovakian state came into existence on Oct. 28, 1918. It is a long narrow state just east of Austria and Germany, 500 miles in length and 50 to 100 miles in width with an area of approximately 55,000 square miles, bordered by five countries. The country was organized mostly from what was the old Austrian-Hungarian Empire, the states of Bohemia, Silesia, Moravia, Slovakia and Ruthenia breaking off. The fundamental difficulty of the new state will be that of holding together such a polyglot people in a state unprotected by natural barriers. Practically the entire country is a dissected upland. The agricultural industries are many, one half the land being suited for those purposes. The crops are potatoes, sugar beets, wheat, rye, barley and oats, and the live stock industry, cattle, horses, pigs and sheep, occupying a prominent place. The country around the border has much forested land, estimated at 32% of the area. The state is very rich in mineral products, much coal and iron,—the coal of Teschen being of excellent coking qualities,—nickel, cobalt, copper, silver and garnets. Bohemia is the heart of the industrial and manufacturing region producing, because of her excellent resources, iron and steel, glass, paper, cotton, and woolens, sugar refineries, furniture, etc. The Bohemian glassware is justly famous the world over for its quality and color. Moravia is chiefly agricultural. The exports are glassware, textiles, iron products, wood products and sugar. Prague is the capital and leading industrial center, Brume, noted for wool manufacturing, and Pilsen and Budweis are also manufacturing centers.

DANZIG, FREE CITY OF. Created by the Versailles Treaty in 1920 and governed by a High Commissioner appointed by the League of Nations. The city is located on the Baltic Sea where the Vistula empties into it. Though surrounded by Poland on one side and Germany (East Prussia) on the other, the port is free to all and was made free to take care of the conflicting demands for an outlet to the sea. The city has an area of 754 square miles and is within the Polish Custom's Union. Its chief business is commercial and shipping, grain, sugar, lumber, salt and some manufactured products coming down the river from the hinterland.

DELAWARE. A Middle Atlantic state. The surface is mainly a level coastal plain, well watered, and devoted to agriculture, nearly all on small farms. Products: maize, wheat, hay, oats, with heavy crops of tomatoes, peaches, small fruits, oysters, and fish. The proximity of large coast cities renders vegetable farming profitable. Manufactures: iron and steel, canned goods, railway cars, leather, powder, ships, brewed and distilled liquors, and knitted goods. Minerals: bog-iron ore, clays (brick, terra-cotta, and kaolin), granite, feldspar, glass sand, and marls. The capital is Dover, and the largest city Wilmington on the Delaware river.

DENMARK. One of the smallest countries of Europe. The surface is generally low, penetrated by large lagoons and inlets or fjords far into the interior. Agriculture is the leading industry, over half the population being so engaged. Products: oats, barley, rye, sugar beets, potatoes, live stock, dairy produce, and fish. Imports: provisions, textiles, oil cake, machinery, coal, cotton, metals, hardware, wood and its manufactures; exports: bacon, butter, eggs, hardware, and animals. Manufacturing is increasing, and now gives employment to one quarter of the population. It includes the making of furniture and foodstuffs, distilling, sugar refining, and brewing. There are no metallic ores, but much peat, kaolin, and some poor coal are found. Copenhagen is the capital and chief commercial center. Jutland is a peninsula without hills, lakes, rivers, or minerals, except chalk. Its products are grains, cattle, and dairy products. Greenland is under the control of Denmark, and is the second largest island in the world; only inhabited near the coast lowlands. Industries are principally fishing and hunting, with very little agriculture. There are 12 chief stations for trading, the northernmost being Upernavik.

DISTRICT OF COLUMBIA. A territory of the American Union, lying between Maryland and Virginia. The surface is flat, or gently rolling and hilly. A small part of the total area is in farms, and the crops are principally vegetables. The largest acreage is pasture, and dairying is a prominent industry. The commerce of the District is principally local, excluding the government works and products. It is the seat of government of the United States, and was ceded by the state of Maryland as a site for the National capital, Washington.

EAST INDIES. A group comprising Borneo, Celebes, Java, New Guinea, Sumatra, and the Spice Islands, with a number of smaller ones. The Philippines (belonging to the United States) are an extension of this group. Borneo is the largest island of the group, North Borneo and Sarawak being under British protection. It is rich in jungle produce and mangrove bark, gutta-percha, coal, oil, iron, antimony, and gold. There is little agriculture, but this is being steadily fostered, as the soil is fertile. The south and east of the island are governed by the Dutch through native rulers, and the chief exports are copra, bamboo, gutta-percha, and cocoanut oil. Celebes is governed by the Dutch, and has a main export of coffee, rice, sugar cane, bird skins, cotton, and sago. Java is governed by the Dutch, and is the most important commercial island of the group. It is very fertile and prosperous. There are more volcanoes than on any other equal area in the world. Exports: coffee, sugar, rice, copra, indigo, pepper, spices, tea, teakwood, and cinchona (quinine). The capital is Batavia, also the principal city of the group. New Guinea or Papua is one of the largest islands in the world, administered by Australia and Holland. Products: cocoanuts, rubber, sisal hemp, coffee, fibers, cotton, sago, vanilla, kapok, cacao, tapioca, cinnamon, tea, tobacco, trepang, copra, pearl shell, and pearls. The forests have valuable woods of sandal, ebony, bamboo, with gum-producing varieties. Minerals: copper and gold. Spice Islands, or Moluccas, are a Dutch possession, not so well watered as the westerly islands, but producing large quantities of spices, nutmegs, cloves, betelnuts, etc., with coffee, cacao, tobacco, indigo, rice, and sago. Minerals: sulphur and petroleum, porcelain clays, tin, and coal. Sumatra is a Dutch possession, noted for its large animals, elephant, rhinoceros, tapir, orang-utan, etc. Its principal product is an immense quantity annually of a very thin-leaved, silky, brilliant tobacco, used exclusively for covering cigars. There are many camphor and gutta-percha trees. Exports: tobacco, coffee, spices, bamboo, gutta-percha, copra, and gums. The natives produce exceedingly clever gold and silver filagree work, also native fabrics and household utensils. Minerals: coal, tin, petroleum. Prin-

cipal cities, Padang, Achin, Deli, Benkulen, and Palembang.

ECUADOR. A South American republic on the Pacific coast. Elevated basins form the centers for ideal agriculture, under a spring-like climate. The staple is cacao, besides coffee, rubber, vegetable ivory, brazil nuts, tobacco, sugar, medicinal barks, and fiber. There are known to be rich deposits of silver, copper, iron, lead, quicksilver, and coal, but these are not worked to any extent; some gold, platinum, and zinc exist. Imports: textiles, foodstuffs, ironwork, gold, and silver; exports: cacao, coffee, vegetable ivory, rubber, and Panama hats. The capital is Quito; chief ports Guayaquil and Esmeraldas.

EGYPT. An extensive country bordering on the Mediterranean and Red seas. It is a part of the great African desert zone. Agriculture engages most of the population. Under the extensive irrigation systems it is possible to obtain three harvests a year: cereals in the spring; rice, maize, millet, and vegetables in September and October; cotton, sugar, and rice in October and November. In Lower Egypt crops of cotton, rice, wheat, maize, barley, clover, and vegetables are grown; Upper Egypt produces crops of cereals and vegetables. There are many old and valuable quarries intermittently worked, some salt, soda, alum, and saltpeter, and the ancient gold workings are proving profitable. Imports: textiles, cereals, wood, coal, metals and manufactures, and leaf tobacco; exports: cotton, cereals, and tobacco products, mainly cigarettes. No tobacco is permitted to be grown, the leaf pays a duty in and the manufactured cigarettes a duty out of the country. The capital is Cairo, with chief ports Alexandria and Port Said.

ELBURZ MOUNTAINS. A range in Persia, extending 450 miles along the southern border of the Caspian Sea; its highest peak is Mount Demavend. The northern slopes are very fertile, and have rich tropical vegetation, poppies, tobacco, cotton, grapes, and dates being produced.

ENGLAND. The most important division of the United Kingdom of Great Britain and Ireland. The commercial situation is improved by numerous navigable rivers, such as the Thames, Humber, Tyne, Severn, and Wye. The surface is mainly a low plain broken by gentle slopes and downs, with mountains in the northwest. Agriculture is an important business, but England differs from other countries in the fact that the land is owned by a comparatively small number, and is leased to others. The average farm is not larger than in the agricultural states of America. For many years the competition of foreign grown crops, and foreign reared cattle, has decreased the gross cultivated acreage, but to-day there is a strong trend towards producing finer qualities of vegetables, cereals, and meat for consumption, obtaining the higher prices without difficulty. About one half the agricultural area is in pastures and grazing lands. Products: wheat, hay, clover, barley, oats, beans, peas, potatoes, turnips, and small quantities of high class fruits. Stock raising is important, and about two thirds of the farm animals are sheep, with the remainder cattle. Minerals: iron in large quantities, coal (of which much is exported), tin, gold, silver, zinc, lead, some copper, manganese, uranium, wolfram, and others. The fisheries are extensive. Other industries: manufacturing of textile fabrics, cotton, wool, and lace, metal working, coal handling, etc. Exports: textile fabrics, coal, coke, iron and steel manufactures, chemicals, machinery, ships, etc. Imports: foodstuffs, grain, meat, and tea in immense quantities, cotton, wool, oil seeds, metals, yarns, wood and timber, chemicals, fruits, tobacco, hides, etc. The United States contributes nearly four times the French and six times the German imports into England. The capital is London, the most important port for imports, and the greatest city in the world in population and commercially, setting the prices for wool, tea, hides, and colonial produce, especially those of India. It has absorbed the city of Westminster and numerous manufacturing villages. The Thames, the most important short river in the world, is spanned by 20 bridges, of which London Bridge is the principal, and the port for deep water vessels extends from London Bridge, 50 miles, to the sea. The river is about 800 feet wide at the bridge, and about six miles wide at the sea. The great docks are 20 miles down the stream. Liverpool is the second largest port, and is the principal export center, being about the size of Boston, Mass. Other important cities are Manchester, noted for cotton working; Birmingham, for metal working; Leeds, for cloth; Newcastle, for coal handling; and Southampton and Fishguard, as ports for ocean travel.

ESTONIA. On the eastern coast of the Baltic Sea, south of the Finnish Gulf, is the new state of Estonia, composed of the old province of Esthonia and Livonia. The area is 18,355 square miles; the population is 1,116,474; the capital is Tallinn. Her independence was declared in 1918. The country had for centuries been dominated by other countries, usually Russia or Germany. The industry is primarily agricultural, and the crops are rye, barley, potatoes, hay, and flour, with some cattle and sheep raising. The roads are very poor and there are almost no railroads. Flax, dairy products, and timber are exported from Reval, the chief seaport.

ERITREA. An Italian colony in northeast Africa, under autonomous administration, and having the management of its own finances. The surface is a narrow coast territory of chalk formation which merges into a subalpine region, rising to a moderately high plateau, broken by arid valleys. There is little cultivation except in the highlands, and irrigation is general. There is abundant pasture, but the pastoral population is nomadic. Many camels, oxen, sheep, and goats are raised for local trade. Imports: cotton goods, durra, cattle, wood, wine, and flour; exports: precious metals, animal products, mother-of-pearl, pearls, and hides. There is a considerable transit trade with Abyssinia and the Sudan. The only railway is 15 miles long, connecting Saati with Massaua. The seat of government is at Asmara.

EURASIA. A name frequently given to Europe and Asia combined to form the largest land mass on the earth's surface. It is a triangle in shape, with its base on the east extending from Bering Strait southward to the Malay Peninsula, and having its apex in the west in Portugal. It has every variety of surface, all kinds of fresh and salt water forms, the highest mountains, the most extensive plains, fertile soil, mineral deposits; possesses the heart of commerce and advancement, and a people who have reached the highest form of human development. It is the birthplace of great religions, literature, and art.

EUROPE. The smallest continent except Australia. Including its polar and other islands, it comprises a little more than one twentieth of the land surface of the world. It is bounded on three sides by the sea, and a broken coast line gives it a greater coastal development than any other country, and to this it owes its commercial supremacy. The coast line proper is lengthened by multitudinous islands, channels, and the penetration of deep sea water far into the interior. The surface is as varied as the coast line. The mountains are the Alps, Ural, Pyrenees, Carpathians, Apennines, Jura, Balkans, and Caucasus. The warm Atlantic Ocean, and the heat radiated from the great Sahara desert, give the west, south, and center of Europe a temperate climate; the soil is fertile and well watered; numerous important "mixed" forests, with vast cone bearing growths, are in the north, and there are great mineral deposits. The largest fresh water lakes are the Ladoga and Onega, in Russia. The principal rivers are the Volga, Danube, Ural, Don, Dneiper, Rhine, Rhone, Elbe, Seine, and Tagus.

FALKLAND ISLANDS. A crown colony of Great Britain in the south Atlantic, consisting of two fairly large islands, and about 100 small ones, besides South Georgia. Many of the islands, are practically unoccupied except by penguins. The soil yields little more than grass, and sheep farming is the staple industry. Imports: provisions, apparel, building materials, machinery, and hardware; exports: wool, hides, skins, tallow, and whale oil. Principal town is Port Stanley.

FAROE ISLANDS. A group of about 21 islands, of which only 17 are inhabited, lying midway between the Shetlands and Iceland. The islands are mostly volcanic rock, with basaltic formations, covered with thin vegetable soil yielding pasturage for the numerous cattle and sheep reared. Fierce and very frequent hurricanes prevent the growth of trees and hinder the cultivation of cereals and the ordinary vegetables. The chief products are those of the sheep, and of the multitudes of sea birds whose eggs, feathers, etc., are gathered as a harvest. There are good fisheries and the natives are expert in this industry. Exports: tallow, train oil, feathers, skins, wool, fish, and butter. Minerals: coal and peat are found, and there are traces of iron, copper, and chalcedony. The group is represented in the Danish Parliament by two delegates selected by the people.

FIJI ISLANDS. A group of more than 200 islands in the south Pacific Ocean, a British crown colony. The soil is very fertile, and agriculture is the principal pursuit. The chief crops are bananas, cocoanuts, maize, sugar cane, yams, tobacco, tea, rice, peanuts, and pineapples. There are dense forests containing many valuable woods. Imports: dry goods, machinery, hardware, live stock, breadstuffs, lumber, oils, and iron; exports: sugar, copra, green fruits, turtle shell, pearl

shell, and beche de mer. The capital is Suva. There is good commercial communication with New Zealand, Australia, and Canada.

FINLAND. Most northerly of civilized countries, a bit larger than the United Kingdom, situated between Sweden and Russia, north of the Baltic Sea and the Gulf of Finland. The country, formerly a grand Duchy of Russia, declared itself a republic in 1919. The country is hilly with a great many lakes and swamps and the soil is very stony and poor due to glacial action. The northern part is covered with Finland's most valuable resource, forests, of pine and spruce. There are no minerals in the country with the exception of a little copper and quarry products. About 10% of the land is cultivated, this almost entirely in the south, and the products are wheat, rye, barley, oats, potatoes, and flax. The dairying industry is getting to be very important. The manufacturing concerns itself chiefly with pulp wood, paper, leather goods, textiles and iron and steel. 75% of the exports are dependent upon the forests, lumber, pulp wood, and paper. Then also we have raw materials, hides, meats and dairy products shipped out. Helsingfors is the capital and chief seaport.

FLORIDA. The most southern of the United States. Consists of level coastal lands, often marshy, rising to an interior hilly, well-wooded area. The Florida Keys, stretching 200 miles, are a remarkable example of coral organism. There is an extensive water system of navigable rivers. There is some fertile soil, and irrigation is steadily developing larger areas. Valuable forests cover three fourths of the state; cultivated lands occupy only a small part. There are more pineapples produced than elsewhere in the United States, and the tobacco crop is mainly of the valuable "wrapper" type, amounting to millions of pounds annually, other products being rice, maize, oats, peanuts, peas, cotton, oranges, oak, pitch pine, tar, turpentine, and resin. There is an extensive fishing industry. Minerals: phosphate rock, fuller's earth, lime, besides mineral waters. Large quantities of cigars are manufactured from imported Cuban tobacco at Tampa and Key West. The capital is Tallahassee, and the other cities, **Jacksonville, Pensacola, Tampa,** and **Key West.**

FRANCE. A European republic. The surface is an extensive lowland, almost cut off from other countries by mountains and water barriers. It is well watered, there being over 200 rivers officially reported navigable, including the Loire, Rhone, Garonne, and Seine. The soil is fertile and the climate subtropical. The highlands at the east rise to Mount Blanc, the highest peak of the Alps, which is on French territory. The area is two thirds under cultivation, with one seventh rich forest lands. Fifty per cent of the population are engaged in agriculture on small farms. Products: sugar beets, grapes (in which France leads the world), barley, wheat, rye, maize, oats, fruits, such as apples, pears, plums in the north, and oranges, lemons, etc., in the south. Stock raising is important, and the fisheries, especially sardine and oyster, are extensive. Imports: wool, cotton, silk, coal, oil seeds, lumber, hides, foodstuffs, and machinery; exports: textiles, wines, silk and wool yarns, skins, furs, linens, clothes, and leather goods; the exports are small compared with other leading European countries. The industrial aim has been for quality, rather than quantity, in silks, velvets, cut glass, textiles, fine woolens, fine linens, fine laces, porcelains, tapestry, gloves, and leather ware. France is relatively poor in minerals and metals. **Paris** is the capital, with chief ports of **Bordeaux, Cherbourg, Dunkirk, Havre,** and **Marseilles.** Its colonies and dependencies are many and very widely scattered. In French India are five towns, **Chandernagar, Karikal, Mahe, Pondicherry,** and **Yanaon,** the chief export being oil seeds. **French Indo-China** consists of five states; **Annam** exporting maize, rice, manioc, areca nut, mulberries, spices, sugar, bamboo, rubber, coffee, medicinal plants, raw silk, and some cattle; **Cambodia** exporting salt fish, cotton, tobacco, rice, indigo, and boats; **Cochin-China** exporting rice, fish and fish oil, pepper, shrimps, cotton, copra, silk, isinglass, hides, and spices; **Tonking** exporting rice and animal products, and **Laos** territory producing rice, cotton, lumber, some gold, lead, and precious stones, being worked by French companies. In Africa, the French colony of **Algeria,** bordering on the Mediterranean, is the largest of all French dependencies; the **French Congo** exports rubber, ivory, woods, palm oil, palm kernels, coffee, cacao, kola nuts, piassava, and other products. **Madagascar,** a large island in the Indian Ocean, has great cattle breeding and agricultural industries; sericulture is advancing. The principal article produced is rubber; exports: rubber, gold, and other minerals, hides, rafia, wax, vanilla, some manufactures, and valuable woods; **Mayotte** and the **Comoro Islands** have small exports; **Reunion** exports sugar; the **Somali Coast Protectorate** exports coffee, ivory, and hides; **French West Africa** includes **Senegal, Upper Senegal** and **Niger, French Guinea,** the **Ivory Coast,** and **Dahomey,** the exports being chiefly maize, rubber, wool, copra, skins, fruits, oil, and oil seeds. The **French Sahara** includes practically the whole of the great desert. **Tunis** is a French protectorate exporting large quantities of wheat, barley, oats, olive oil, wine, cork, tropical fruits, copper, lead, and zinc ores, phosphates, sardines, anchovies, and other fish. **Guadaloupe** is in the West Indies, and is a French colony exporting sugar, bananas, tobacco, rum, coffee, vegetables, and cacao. **French Guiana,** in South America, exports cacao, phosphates, woods, gold, rosewood essence, and hides. **Martinique,** in the West Indies, exports rum, coffee, cotton, sugar, and cacao. **St. Pierre** and **Miquelon** are the largest islands in a group off Newfoundland exporting dried and fresh codfish and cod liver oil. **New Caledonia** and dependencies, near Australia, export nickel, cobalt, chrome, and copper ores, coffee, beans, and copra; the **New Hebrides,** jointly administered by France and England, export maize, coffee, and vanilla; the French establishments in Oceania consist of the **Society Islands,** the **Marquesas,** the **Tuamotu group,** the **Gambier, Tubuai,** and **Rapa islands,** the most important being **Tahiti,** with general exports of sugar, molasses, copra, pearls, mother-of-pearl, vanilla, cocoanuts, and oranges.

FRANKLIN. A Canadian district consisting of numerous large and small islands off the mainland, including **Baffin's Land** and **Prince Albert Land** not fully explored, but believed to be almost wholly destitute of animal and vegetable life. There are a few Eskimos on Baffin's Land.

GALAPAGOS ISLANDS. A group of small islands in the Pacific, about 600 miles west of Equador, officially renamed **Celon Archipelago** in 1892, the largest being Albemarle, Indefatigable, Chatham, James, and Charles. They are of volcanic origin. Turtles are chief product, although there is some sugar growing and cattle raising. The group is of extreme interest to scientists and zoölogists, and it was the observation of the peculiarities of the fauna, and the influence of the facts upon the evolutionary history of animals made during the voyage of the Beagle, which is believed to have been responsible for the later speculations of Darwin, Wallace, and other evolutionists. The archipelago is accepted as a most fruitful illustration of insular influences on animal life, and of the effects of isolation.

GANGES. An important river of north India, and one of the 12 great rivers of the world. It rises in the Himalayas, draining the southern ranges, and, after a southern and eastern course, flows into the Bay of Bengal through a multiplicity of channels extending through a delta nearly 300 miles long. The basin of the Ganges is one of the most fertile spots on the earth. Each spring the snow melts and the river overflows, as does the Amazon and Nile, flooding and carrying valuable alluvial mud over an enormous area, rendering fertilization unnecessary—an important feature in Lower Bengal. It is continually changing old channels for new, and the influence of the tides is estimated to extend 240 miles from the sea. It is navigable in sections. The Hindus hold it in high veneration as the holiest of rivers, and as a cleanser from sin.

GEORGIA, (U. S. A.). An important Southern state with surface, soil, and climate so varied that it has been said that "if cut off from the remainder of the world Georgia could supply all the needs of her people." Agriculture is the leading industry, nearly three fourths of the area being under cultivation. It is the second largest cotton state, and is the largest producer of sea island cotton. In the north large quantities of maize are grown, also wheat, and oats; rice in the coast counties; sugar cane, tobacco, peanuts, sweet potatoes, watermelons, and immense crops of fruits, especially peaches, are produced. Forest lands are extensive, mainly pine, cypress, juniper, and some hard woods, and turpentine and resin represent about one half of the total produced in the United States. Stock raising is unimportant. Oyster and shad fisheries are large. Minerals: gold, silver, coal, iron, and manganese ores, iron pyrites, bauxite, graphite, lime, ocher, infusorial earths, natural cement, talc, soapstone, clays, valuable marble quarries, besides mineral springs. There is much water power in the state, and prominent manufactures are textiles, cotton goods, lumber products, fertilizers, cottonseed and oil. The capital is **Atlanta,** the chief ports **Savannah** and **Brunswick.**

GEORGIA, (Europe). A Soviet republic bordering on the Black Sea, south of the Caucasus Mts. and north of Armenia, which is composed of the provinces of **Tiflis, Kutain** and **Batum,** together with the provinces of **Zakataly** and **Sakhum,** having an area of approximately 3500 square miles, and while nominally a republic, is

virtually under the constant influence of the Russian Soviets. The principal crops are grapes for wine, cereals, cotton, and corn. Large quantities of fruit are grown on the hillsides and a good sized animal industry abounds, including cattle, sheep, goats, bee keeping and silk worm production. In this state is found the largest manganese deposits in the world and also some oil, copper, zinc, lead and antimony. The capital is Tifis, an inland city and the port, Batum, on the Black Sea, is a great oil distributing center.

GERMANY. A republic in central Europe formed in 1918 after the abdication of Kaiser Wilhelm. Due to the treaty of Versailles the territory of the old Empire was cut down from 209,000 square miles to 177,000 square miles and the following are among the sections affected: Alsace-Loraine—area of 5600 square miles, taken from France in 1871 and now returned, on the boundary line between France and Germany and because of rich natural resources a source of constant friction. Loraine has richest beds of ore in Europe, 75% of all Germany mined in 1914 coming from there. Alsace has great deposits of potash, salt, oil and land of great agricultural value. While not an actual loss, the separation of East Prussia from the main body of Germany by the so-called Polish Corridor may lead to serious political and economic difficulties. This corridor is a strip 30 miles wide along the Vistula allowing Poland an outlet to Danzig and the sea. Eupen, Malmedy and Moresnet—on the Belgium frontier and ceded to Belgium; only an area of 382 square miles but strategically rather than economically important. Memel—to the north of East Prussia, ceded by the League of Nations over to Lithuania. Posen—and neighboring areas to the east have been given to Poland which are very rich mineral lands and fertile agriculturally, particularly grain and potato land. The Saar Basin, between Germany and France, is an area of great coal resources, estimated at 17,000,000,000 tons. France being poor in coal desired this area and as a compensation for damages done by the Germans to French mines at Lens and Valenciennes, the coal of the Saar was turned over to them for 15 years. The area is to be governed by the League, the final ownership to be decided by plebiscite. East Silesia, ceded to Poland under a plebiscite charge, an area of great mineral resources, one-fifth of all Germany's coal coming from here, together with her lead and zinc in large amounts. Slesvig, between Germany and Denmark, 1,540 square miles, ceded to Denmark. No great loss economically. Germany also lost all of her colonies in Africa, Togoland, Cameroons, German South West Africa, and German East Africa and in the Pacific, Nauru Island, Kaiser Wilhelm's Land, Marshall, Mariaine, Caroline Island, and Samoa. After suffering these losses mentioned, particularly the loss of natural resources, Germany has found it difficult to get back to her pre-war industrial life. The physical divisions of the country from north to south include: the Central Plains to the north, a great agricultural region; the Central Highlands, the area of Germany's mineral deposits and manufacturing establishments; the Middle Rhine Plain, rich, fertile, 20 to 25 miles wide, agricultural region; the North Slope of the Alps, heavily forested. The rivers, very important as commercial arteries, are the Rhine, probably the most important river artery in Europe, 800 miles long, has 20 important cities on it or tributary to it, the Elbe with the great port of Hamburg, the Oder and the Vistula. The canal systems of Germany are remarkable. The agricultural crops are, potatoes (leads the world in production), rye, sugar beets, corn, oats, barley, tobacco, apples, grapes and hops. The live stock industry is very important with horses, cattle, pigs, goats, and sheep showing up well in European comparisons. Her forestry industry is on a scientific basis, trained workers, and a great many state reserves. Ash, birch, oak, and beech are the principle types. The mineral resources have been sadly depleted by the loss of territory, particularly in iron (Alsace-Loraine) and potash (Alsace). In the latter resource she had enough to supply the world for 2,000 years. But now her resources are coal, zinc, lead, copper, silver, and graphite. Germany was and still is a great manufacturing country, but she has lost much of her former prestige. The general products are iron and steel, ships, woolens, cotton, silks, dyes, chemicals, instruments, sugar refining, toys, scientific intruments, copper and brass goods, leather goods, and rubber products. Her foreign trade, once huge, is slowly returning. Exports are, steel products, woolens, silks, cottons, beet sugar, chemicals and dyes, leather goods, toys and glassware. The capital is Berlin, the seaports are Hamburg, Bremen, Stettin and Danzig, and the great industrial cities are Essen, Dussildorf, Dresden, Brelau, and Cologne.

GIBRALTAR. The Rock of Gibraltar is a crown colony of Great Britain, of great strategic importance, commanding the entrance to the Mediterranean. It is a naval base and coaling station, with a good harbor, exporting wine, fruit, and cork.

GILBERT ISLANDS. A British archipelago in Oceania. The group consists of 16 small islands, the largest being Taputeuca, Arorai, Nonuti, Apamama, Maiana, and Maraki. The chief product is copra.

GREECE. The most eastern of the three peninsulas of Europe projecting into the Mediterranean, and once the most highly civilized country. It has a mile of coast line to every ten miles of area, but has few good harbors. A mountainous land with successive narrow valleys; the only great plains are those of Thessaly. The rivers are small and unnavigable. Agricultural cultivation depends on irrigation, which is unequally distributed; one half of the area is pasture land or waste. The farms are small, producing wheat, barley, rye, and maize, but the best crops are currents, grapes, acorns (for tanning), cigarette tobacco, silk, olives, honey, citrus fruits, and figs. Minerals: iron, copper, zinc, lead, with many others in small quantities. Manufactures: cloth, carpets, metal and leather goods, silk, wool, flour, alimentary pastes, etc., mainly for home consumption, but of high quality. Imports: agricultural products, textile raw materials, and machinery. Exports: currents, wines, grapes, raisins, tobacco, olive oil, sponges, and forest and animal products. The capital is Athens, with its port, Piraeus, six miles distant. Other towns are Patras, Corfu, and Volo.

GUATEMALA. The largest of the Central American republics. The greater part of the surface is mountainous, but the upland valleys are very fertile. Coffee is grown extensively, the largest plantations owned by Germans; also wheat, maize, sweet potatoes, beans, indigo, cacao, and some cotton. Gold and silver are worked, salt and other minerals exist. Imports: cotton goods, machinery, ironware, and provisions; exports: coffee, mahogany, cedar, dyewoods, hides, rubber, bananas, sugar, and chicle. The capital is Guatemala la Nueva, the chief port Puerto Barrios, and important towns Quezaltenango, Coban, and Totonicapan.

HAWAII. A group of 12 Pacific islands belonging to the United States. Seven are inhabited, the largest being Hawaii, the most important Oahu, which has the only good harbor, and the capital, Honolulu. The surface is largely mountainous and volcanic, but the soil is very rich. Products: sugar, tropical fruits, rice, coffee, and cattle. Imports: clothes, textiles, lumber, and machinery; exports: coffee, sugar, molasses, rice, bananas, oranges, pineapples, honey, wool, tallow, and hides, in large quantities. Honolulu is a mid-ocean post office, and several lines of steamers on both sides of the Pacific engage in trade with the mainland.

HEBRIDES. A name applied to the islands of the west coast of Scotland, classified as the Outer and Inner Hebrides. The islands of Bute, Arran, and the Cumbraes, lying in the Firth of Clyde, are usually classed with the Hebrides. The total number of islands is about 521, and about 120 are inhabited. Owing to the Gulf Stream they have a mild though humid climate. Much of the area has been converted into sheep walks, and extensive tracts are rented to sportsmen. There is considerable arable land, the remainder is pasture, morasses, peat-mosses, lakes, barren sands, and rocks. The scenery is grand, especially in Mull, Jura, and Arran, with their lofty mountains, peaks, and rugged hills. Staffa is remarkable for its basaltic columns and great cave, and Iona is rich in ruins and historical associations. Industries: sheep, cattle and pony raising, herring fishing, and the manufacture of kelp. Exports: live stock, fish, kelp, wool, and stone. The principal towns are Stornoway in Lewis, Portree in Skye, Tobermory in Mull, and Rothesay in Bute, the latter being a great tourist resort.

HEDJAZ. An independent kingdom on the west side of the peninsula of Arabia, bordering on the Red Sea, with an area of about 170,000 square miles. The chief occupation is taking care of the thousands of pilgrims that come to Mecca. Dates are the chief crop and the exports, wool, grain, and hides. Mecca and Medina are the two chief cities and Jidda the chief port.

HIMALAYA MOUNTAINS. The southern ranges bordering the great Asiatic plateau for a distance of 1,500 miles, the grandest in the world. They radiate from the Pamir plateau, "the Roof of the World," and contain more than 40 peaks over four miles high, Mount Everest being the highest. The southern or snowy region is plentifully studded with glaciers and contains lofty peaks; the northern, forms a watershed in Tibet, which has been little explored, as but one pass is known. Metallic ores exist in almost every part, but gold, copper, iron, and lead are the only ones extracted.

HINDU KUSH MOUNTAINS. They extend westward from Pamir between Afghanistan and Turkestan; are the source of several rivers; their highest point is Tirach Mir. Minerals, especially iron, are very abundant.

HONDURAS. A Central American republic. It is a table-land except along the coast. It is rich in resources, but, lacking capital and population, half its area is rich virgin waste. There is considerable agriculture, some cattle raising, and mining; silver, gold, copper, lead, and other ores are found; the principal manufacturing industry is the plaiting of straw hats. Bananas are the chief product. There are valuable forests of mahogany, cedar, and lignum-vitæ. Imports: cotton, breadstuffs, hardware, and machinery; exports: bananas, ores, bar silver, hides, cattle, cocoanuts, lemons, oranges, indigo, sarsaparilla, maize, cacao, tobacco, and timber. More than half the entire trade is with the United States. The capital is Tegucigalpa; the chief ports are Amapala, Puerto Cortes, and Trujillo.

HONGKONG. A British crown colony, consisting of a number of islands off the southeastern coast of China at the mouth of the Canton River. Hongkong, the largest, lies close to the mainland and contains the capital, Victoria, having one of the finest harbors in the world, with seven dry docks, the largest 700 feet long. It is a free port and is the center of China's foreign trade, handling about 40 per cent. Both exports and imports are resold and reshipped by Hongkong merchants, and include sugar, opium, cotton and yarns, woolens, flour, oil, amber, tea, iron, machinery, copper, coal, flour, ginseng, rice, silks, ivory, betel, and sandalwood.

HUDSON RIVER. The principal river of New York state, and one of the most beautiful and valuable waterways in the eastern states. It rises in the Adirondacks, drawing its waters on both sides of the range, from many attractive lakes, and from springs on the sides of many forested mountains. Its important tributaries are the Sacondaga, the Mohawk, and the Walkill, which unite with the parent stream above Troy, from which point it is navigable to the sea. Connection with the Atlantic and Central states is completed by means of the Erie Canal. The varied beauty of the river scenery has given to the Hudson the name of the "American Rhine."

HUNGARY. An independent republic first, formed in 1918 out of part of the old Austrian-Hungarian Empire, ruled now by a regent, until such time as the people can decide the type of government they want. The country is in eastern Europe, just east of Austria and south of Czecho-Slovakia and is physically two plains, called the big and little Alföld. This Hungary has only one-third of its former area and population and lost territory to Rumania, Czecho-Slovakia and Yugoslavia. The plain area gives the country no military protection and no water power. Agriculture is the only important industry, three-fourths of the people earning their livelihood that way. The crops are wheat, maize, sugar beets, grapes, tobacco, cattle, flax, oats, and potatoes. Practically no mineral deposits exist with the exception of coal at Pecs. The Danube River is the great commercial artery and the only outlet for goods, the country having no seaport. The manufacturing industries are flour, breweries, tobacco, sugar and agricultural implements. Budapest is the capital and the chief industrial city.

ICELAND. Iceland, granted its independence from Denmark in 1919 but under the Danish Custom's Union, is a large volcanic island in the Atlantic Ocean. The only habitable land is along the coasts and in the river valleys; hay and vegetables are the only crops, and some sheep and the small tricolored Icelandic ponies (miscalled "Shetland") are the farm stock. The chief imports are grain and meal, sugar, coffee, salt, cotton goods, tobacco, liquors, hardware, and timber. The chief exports: ponies, Iceland moss, stockfish, wool, eider-down, sea birds' eggs, sulphur, whale and seal oil. The chief port is Reykjavik, the capital.

IDAHO. A Western state. An elevated and mountainous district lying between the Rocky Mountains on the east, the Cascades on the west, with ranges to the north. Much of the land is arid, but great work is being done by irrigation. The climate is severe in the north, with heavy winter snows. Agriculture is limited to the mountain valleys and the basins of the great rivers, where irrigation is rapidly developing the rich alluvial soil. The principal farm products are wheat, oats, barley, hay, fruits, and vegetables. It is good grazing land for sheep, which constitute the leading farm stock. There is considerable lumber acreage. Beet sugar is an increasing product, also butter. The state is rich in minerals—gold, silver, copper, lead, zinc, some coal, iron, nickel, cobalt, mica, phosphate rock, antimony, tungsten, granite, limestone, sandstone, lime, pumice, and salt. The manufacture of lumber and timber, and flour and grist is becoming an important industry. The capital is Boise.

ILLINOIS. One of the great Central states showing rapid improvement during the past fifty years. Illinois lies within the vast prairie area, and has a level surface sloping in an immense plain from the low lying north and northwestern hills. The state is largely agricultural, and it should be noted that over seven eighths of the farm area is classed as "improved." The farm products include maize, wheat, oats, barley, rye, and buckwheat; large quantities of potatoes and hay are produced; some tobacco is grown, and there is a very active live stock industry. It is estimated there are within the state millions of farm animals, such as horses, cattle, sheep, hogs and mules. Very important industries are slaughtering and packing, manufactures of iron and steel, clothing, liquors, flour, agricultural implements, steam railroad cars, electrical machinery, lumber, furniture, and printing. The chief mineral product is coal, this being principally bituminous, giving employment to a large number of people. There are also found petroleum, natural gas, zinc, fluorspar, sandstone, limestone, Portland cement, natural rock cement, and clay products (bricks, tiles, and pottery). Illinois is one the most important manufacturing states west of the Alleghanies and ranks well with New York and Pennsylvania. Important cities are Chicago, Peoria, East St. Louis, Quincy, and Springfield, the capital.

INDIA. The most important commercial country of Asia, governed by England under the title of Empire of India. A vast peninsula of southern Asia, fifteen times the size of England, almost a world in itself, and isolated by the gigantic Himalaya Mountains at the north. The staple industry is agriculture, the native manufactures being mainly handicrafts such as carpets, shawls, rugs, and exquisite metal and ivory work. The chief imports are cotton manufactures, metals, silks, woolens, sugar, liquors, railway plant and rolling stock, apparel, and chemicals; the chief exports are cotton, rice, wheat, seed, cereals, opium, tea, tobacco, hides, jute, wool, lac, and indigo. The country is divided into presidencies and provinces, with the production as follows: Agra is the great sugar producing district; Assam grows the most tea, nearly one third the total crop, and is famed as the "wettest spot on earth," the annual rainfall being 610 inches at Cherra Punji, or practically 61,610 tons of water to the acre; Bengal grows one third of the great rice crop, which ranks next to that of China, also one half the tobacco crop, and nearly one third of the oil seed crop. Berar stands second in cotton production. Burma (Upper and Lower) is second in rice production. Bombay and Sindh grow large quantities of cereals and cotton. The Central Provinces produce large crops of wheat, cotton, rice, oil seeds, and cereals. Madras is a great producer of cotton, rice, tobacco, oil seeds, cereals, and stands at the head of the indigo crop. Oudh has important sugar, rice, wheat, and cereal crops. Punjab grows the most wheat, and is a large seed and cereal grower. The Northwest Provinces, Ajmere-Merwara, Pargana-Manpur, and Coorg are unimportant, except that Coorg contributes to the thousands of acres of coffee grown in Madras, Bengal, and Coorg; there are also many thousand acres devoted to jute. There are abundant mineral resources not developed—coal, iron, gold, copper, saltpeter, rubies, petroleum, and rock salt. Forests produce teak, bamboo, palm, conifers, and oak. Rainfall is heavy but irregularly dispersed, and irrigation is the only channel of ultimate development. Baluchistan is a semi-independent division. There is not much land under cultivation. The crops are cotton, fruits, indigo, and tobacco, and mineral deposits are numerous. Exports: wool, hides, fruits, and tobacco. The capital is Delhi. The six principal ports are Calcutta, metropolis of India, through which passes one third of India's trade; Bombay, capital of Bombay, on the west coast, one of the perfect harbors of the world; Rangoon, in Burma; Madras, the third city of India, has no harbor, only a roadstead, dangerous in cyclones; Karachi, on the northwest coast, and the much less important Tuticorin.

INDIANA. A Central state whose surface is mainly plains and rolling prairies sloping to the north and south, well watered by the Ohio, Wabash, Kankakee, and Illinois rivers, and Lake Michigan. It is largely agricultural, almost the whole area being farms, with over three quarters improved land. The soil is very rich in certain sections, growing wheat, maize, hay, oats, barley, rye, buckwheat, vegetables, tobacco, and fruits. There is a clip of scoured wool estimated at several million pounds annually. Large quantities of coal and petroleum, sand-

stone, limestone, Portland cement, natural rock cement, clays (for bricks, tiles, pipes, pottery, etc.), and mineral springs are found. Industries: meat packing and slaughtering, flour and grist milling, lumbering, and manufacturing of wagons, machinery, glass works, and agricultural implements. The capital is Indianapolis, a great railway center, important also in live stock traffic.

INDIAN OCEAN. One of the five great oceans. Bounded on the west by Africa, the north by Asia, the east by the East Indian Archipelago, and south by the Southern Ocean. It covers over 28,900,000 square miles, and contains many islands. Arabian Sea and Bay of Bengal are two of its arms. The greatest depth is southeast of Java, over 20,000 feet, the average depth being estimated at about 12,000 feet. The mean temperature of the northern portion is estimated at considerably over 80 degrees, the bottom temperature falling to 40 degrees near the equator, indicating cold Antarctic currents. It was traversed as a commercial channel for 2,000 years, while only coasting voyages were known in the Atlantic Ocean.

INDUS. One of the great rivers of the world, separating India from Afghanistan and Baluchistan, rising in Tibet. It is over 1,800 miles long with a source 15,000 feet above sea level. Through the once arid plains of Sindh it splits into numerous channels. It is navigable for about half its length, but the traffic is mainly by native boats, owing to the competition of adjacent railways. Its value in irrigation under British inauguration has marvelously developed the rainless alluvial land of Sindh. It is the "King River" in Vedic poetry.

IOWA. A Central state, noted for its climate, within the great prairie belt, having no mountains, hills, or bluffs. Well watered by the Des Moines and affluents of the Mississippi and Missouri. The greater part of the soil is of almost inexhaustible richness, nearly all of the surface being improved land. Maize and wheat are very important crops, also oats, barley, rye, buckwheat, potatoes, hay, and flaxseed. The state stands second to Texas in cattle. Slaughtering and meat packing, dairying, flour and grist milling, poultry keeping, and lumbering are extensive. Minerals: large coal deposits, iron, lead, gypsum, ocher, sandstone, limestone, and clays, besides mineral waters. Des Moines is the capital, Dubuque an important railway center.

IRELAND. The smaller of the two islands forming the British Isles, divided politically into two parts, to the south the Irish Free State, self-governing yet part of the Empire and to the north, Ulster, called Northern Ireland, an integral part of the United Kingdom. The surface is a central depressed plain almost surrounded by coast ranges, which largely drain inland, forming many bogs and lakes, there being no defined water system. The principal river is the Shannon, which is navigable over a considerable area, connecting with a good canal system. The soil is fertile, having about three times as much pasture as cultivated land. Agriculture is the main industry; large quantities of oats, potatoes, turnips, some wheat, beans, and peas are raised; butter, eggs, and bacon are largely produced. Minerals: iron ore, some anthracite coal, and less copper. Deep sea and inland water fisheries, especially salmon, are pursued. Manufacturing has been greatly hampered by want of sufficient coal and water power. Fine linens, poplins, shirts, porter and beer, ships (the White Star liners, including the Oceanic, Celtic, Cedric, being built at Belfast), and the home products of knitting, embroidery, and lace making are important. Dublin is the capital, and Belfast and Cork are leading ports.

IRISH SEA. Lying between the north of Ireland and the north of England, it is connected with the Atlantic by the North Channel at the north and St. George's Channel at the south. It contains the Isles of Man and Anglesey, both of which are rich in minerals. Liverpool, Dublin, and Belfast are ports.

ISLE OF MAN. An island in the center of the Irish Sea, equidistant from England and Ireland. It is about 32 miles long by 12 miles broad. The scenery is varied and picturesque, consisting of mountains, wooded glens, and undulating plains. Agriculture is followed in the level northern and southern districts, and many cattle and sheep are pastured. There is also a famous breed of tailless cats. Great quantities of lead are extracted annually containing more silver than any other ore in the United Kingdom; considerable copper, iron, and zinc are mined. The manufactures are unimportant, and the principal revenue is derived from large numbers of tourists. It has a constitution and a government of its own, to a certain extent independent of the Imperial British Parliament.

ITALY. A kingdom occupying the "boot-shaped" peninsula of southern Europe, with Sicily, Sardinia, and other islands. The surface of Italy is a mountainous plateau sloping to the east and west; about one third is a plain, watered by the Po, the only large river, with its tributaries navigable about 600 miles. The historic Tiber and the Arno are short rivers connected by a canal system, and contribute to the irrigation system of the great plain. Agriculture is the chief industry, nearly three fourths of the area being under cultivation, employing about one third of the population; a small part is covered with forests, including chestnut plantations, the nuts being used largely as food. Grapes and semi-tropical fruits are the leading crops, the wine production being the second largest in the world; other crops are wheat, maize, olives, rice, and about 11 per cent. of the raw silk of the world, (third in order to Japan and China). Italy is not rich in minerals, producing silver, iron, mineral fuels, copper and zinc in small quantities, asphalt, marble, granite, and alabaster. Sulphur is the great product. The fisheries include tunny, anchovy, and sardine. Its manufactures include silk thread cotton tissues, woolens, glass, and ceramic wares, tobacco, paper, and hats. Imports: wheat, raw cotton, coal, machinery, timber, wrought iron and steel, raw silk, and wool; exports: raw silk, cotton and silk tissues, olive oil, eggs, wines, hemp, dried fruits, sulphur, and cheese. Rome, called the "Eternal City," is the capital, and is one of the oldest cities in Europe, once the capital of the great Roman Empire; the chief port is Genoa, where Columbus was born; other important cities are Naples, Milan, Florence, Venice, and Palermo. Italy includes the independent Republic of San Marino. The Italian possessions in Africa include the colony of Eritrea on the Red Sea, of which Massuau and the Dahlak Archipelago are a part; gold and pearls are products. Italian Somaliland is a protectorate on the eastern coast, exporting timber, hides, butter, and durra. Tripoli was annexed in 1912. Italian Libia on the coast of Africa between Tunis and Egypt was secured in 1919 from France, and Rhodes, an island of the Aegean group in the Mediterranean was annexed from Turkey.

JAPAN. An island empire consisting of about 4,000 islands, 500 inhabited, lying on the east coast of Asia. Honshiu (mainland), Khshiu, Shikoku, and Yezo constitute "Japan proper," the others being regarded as colonies. It is a land of high mountains and deep valleys, well watered but with no river system. The principal occupation is agriculture; more than half of the population are employed on a multitude of small farms not averaging much over two acres, every inch being cultivated. About one third of the total area is under cultivation, and one half is forest. The crops are rice, barley, tea, sugar, wheat, rye, silk (nearly 56 per cent. of the world product, largest producer in the world), and bamboo. Important trees are camphor, mulberry, and the vegetable wax tree. Manufactures are developing rapidly in textiles, paper, lacquer, embroideries, ships, machinery, tools, painted crepes, porcelains, and bronze. Minerals: copper, sulphur, silver, manganese, iron pyrites, coal, gold, antimony, petroleum and lead. Imports: raw cotton, rice, woolens, ironwork, beans, wheat, flour, sugar, oil cake, and petroleum; exports: cotton yarns, raw silk, tea, silk manufactures, matches, camphor, silk waste, rice, matting, and porcelain. The capital is Tokyo, with principal ports and cities of Nagasaki, Kobe, Yokohama, Osaka, and Kioto. Formosa is a large and important island, rich in agricultural products, importing gold, tea, and camphor, the bulk of the trade being with Japan. The Pescadores represent an area of about 50 square miles. Japanese Sakhalin, in the southern part of that island, has important herring fisheries, forests, and minerals. The leased territory of Kwangtung, the southern part of the Liaotung Peninsula, is an agricultural area producing maize, millet, wheat, buckwheat, rice, hemp, tobacco, and vegetables. Salt producing and fishing are important industries. Dairen has a fine, ice-free harbor, protected by a breakwater.

JUAN FERNANDEZ. A small group of islands in the Pacific Ocean belonging to the province of Valparaiso, Chile, also known as Mas-a-Tierra. The islands are of volcanic origin, fertile, well wooded, and differ remarkably from the mainland in flora and fauna. There is little agriculture, but the land is suited to the production of grain, and especially of small fruits. Cattle raising is the staple industry. Alexander Selkirk lived there in solitude for four years, and his experiences are supposed to have suggested the story of "Robinson Crusoe" to Daniel Defoe.

YUGO-SLAVIA. A country of 96,000 square miles in area, one-half the size of Germany, on the east coast of the Adriatic Sea, that set up a union and declared its independence in 1918. The new state is composed of Serbia, Montenegro, Bosnia, Herzegovina, Dalmatia,

Croatia, Slovania, a part of West Bulgaria, and a small section of the Banat of the Temesvar. Physically the country is very mountainous and rough. Montenegro being considered quite the roughest and wildest section of Europe. There is little transportation. The climate is very severe in winter and quite warm in the summer. On the hills we find a good bit of timber, containing beech, oak and fir. Farming methods are crude, the yield per acre is small and very little machinery is used. The crops are corn, oats, rye, wheat, olives, lemons, and grapes, cattle, sheep, and goats are raised to some extent. The mineral resources are a minor factor: a little coal, mostly lignite, iron, copper, gold, chrome, lead and antimony, these in small quantities. What manufacturing is done is of the simplest, such as flour milling, weaving and tanning. Belgrade is the capital and industrial city. Fiume, the port, was given to Italy by treaty in 1924.

KANSAS. A Central state. The surface is rolling prairie, with low hills. The drainage is perfect from the Kansas river in the north and the Arkansas in the south, with their tributaries, leaving no marshy tracts within the state. The Missouri, forming part of the eastern boundary, is here navigable. The bulk of the soil is very rich, with three fifths of the cultivated area improved land; there is irrigation in the Arkansas valley. It is first in wheat growing. The leading crops are maize, fruit, wheat, hay, flax, and alfalfa. Other industries are raising live stock, slaughtering and meat packing, flour and grist milling, car building, and zinc smelting. Minerals: coal, oil, natural gas, zinc, gypsum, Portland cement, limestone salt, and rock salt. The capital is Topeka, and the principal city Kansas City.

KEEWATIN. A district of Manitoba extending from Manitoba and Ontario on the south to the Arctic Ocean. The surface in the interior is rugged, but has no great elevations. It is well watered by the Severn, Nelson, Churchill, Great Fish or Back rivers. There is much good arable and wheat land; the southern half contains dense and valuable forests of spruce, Banksian pine, and aspen poplar. Gold and copper have been found and there is a valuable trade in fur-bearing animals.

KENTUCKY. A Central state, consisting of a plateau sloping gently west and northwest to the Mississippi and Ohio rivers. The Cumberland, Tennessee, Licking, and Kentucky rivers cross it, forming an extensive drainage system to the Ohio, all of which are navigable. The soil is wonderfully rich, two thirds of the agricultural area being improved land. The chief crops are tobacco, in which Kentucky leads, maize, wheat, hemp, hay, potatoes, watermelons, fruits, and some cotton. Stock raising is an important industry, and the state has long been famed for its fine horses, due to its limestone laden earth, which produces the "blue grass" in the finest pasture region in the world. There are important forests of oak, maple, ash, beech, walnut, and pine. Other industries are flour and grist milling, lumbering, mining, distilling, and manufacturing men's clothing. Mineral products: coal, fluorspar, sandstone, limestone, clays, iron, lead, barytes, lime, cement, asphalt, natural gas, besides mineral waters. The capital is Frankfort, and principal cities Louisville, the great tobacco market of the Union, Covington, and Lexington.

KOREA (CHOSEN). A country embracing the peninsula between the Sea of Japan and the Yellow Sea, now a province of the Japanese Empire. The northern half is mountainous and heavily wooded; the southern half is in ridges and spurs, deeply indented. There are no great rivers but the land is well watered. Most of the area is under cultivation. The north grows barley, millet, oats; the south; rice, wheat, other grains, tobacco, and many millions of pound of cotton annually. The fisheries are important; gold, copper, iron, and coal are abundant but undeveloped. Imports: cotton goods and yarns, iron, railway materials, silk goods, timber, tobacco, and petroleum; exports: rice, beans, hides, ginseng, gold, live stock, and fish products. There is poor communication, transport being by porters, pack horses and oxen, or by boats, although railroads are now being built to connect with the Siberian and Chinese lines. The capital is Seoul, with important ports Port Hamilton, Ping-Yang, and Chemulpo.

KUENLUN MOUNTAINS. They extend eastward into China in a curved line from Pamir and form the northern boundary of Tibet, having the higest average elevation in the world.

LATVIA. One of the small Baltic states, just south of Esthonia on the Baltic Sea, composed of part of Livonia and all of Courland, that gained its independence from Russia in 1918. The country is physically a part of the Russian plain and agriculture is the predominant industry. The crops are rye, cereals, flax and barley. There is a good bit of timber land to the north. 80% of the exports are flax and timber. Riga is the capital and one of the chief seaports on the Baltic Sea, a port that Russia desires greatly, causing constant friction.

LIBERIA. A negro republic on the west coast of Africa, founded as a permanent provision for freed American slaves. Only the coast line to a depth of about seven miles is developed to any extent. There are no railways. The country has rich agricultural, mining, and industrial possibilities. It would make a splendid coffee country, and some little is grown, also cacao, cotton, kola, peppers, and seed for home consumption. There are immensely valuable forest lands. There are gold, copper, zinc, corundum, and other minerals, but unworked. Imports: cottons, provisions, hardware, clothing, boots, and shoes; exports: rubber, piassava fiber, cacao, ivory, palm oil, palm kernels, coffee, ginger, camwood, and arnotto. The capital is Monrovia, the only port.

LIECHTENSTEIN. A principality of 65 square miles lying between Austria and Switzerland, governing itself since 1921 but belonging to the Swiss Custom's Union. It uses the Swiss post office, and the telegraph service, the diplomatic and consular service are taken care of by Switzerland. It is primarily agricultural, raising cattle, grapes, fruit, corn and timber. The capital is Vaduz.

LITHUANIA. To the north of Poland on the Baltic Sea. The country declared her independence from Russia and Prussia in 1918. Lithuania was formerly about 54,000 square miles in area but is now less than half that or 20,550. There are no mineral resources, agriculture and lumbering being the chief industries. The timber areas are mostly of pine. The agricultural products are cereals, flax, potatoes, wheat and rye with some animal husbandry. The means of transportation within the country are very poor and have retarded the development. The exports are mainly flax, rye, butter, eggs, hides and timber. Kovno is the capital.

LOUISIANA. A Southern state, noted for its immense flood plains and deltas. The rich soil is protected from the river overflow by great levees extending over 1,500 miles. The climate is semi-tropical, and the crops include large quantities of maize, rice, cane sugar, cotton, cottonseed, oats, potatoes, hay, and tobacco. There is a large forest area with important lumbering industries. The oyster fisheries are very valuable. Minerals: sulphur, rock salt, petroleum, clays, and marls. Refining of sugar and molasses, and manufacture of cottonseed oil preparations are important. It is the central point of commerce of the whole Mississippi system, and has an immense foreign trade. Exports: cotton, cottonseed products, sugar, cereals, beeves, mules, and horses. The capital is Baton Rouge, and the chief city New Orleans, the metropolis of the South.

LUXEMBURG. An independent grand duchy of Europe, linked to Belgium for economic unity and using their currency. The surface is a plateau with many valleys which are well wooded. Agriculture is the staple industry, and about one half of the total area is arable land. Large quantities of cereals, grapes, and fruits are grown, and stock raising is important. Other leading industries are connected with the mineral production, and the manufacture of woolens, gloves, pottery, paper, beer, and leather. The imports are principally coke, coal, and grain; the exports, minerals and manufactures. The capital is Luxemburg.

MACKENZIE. A Canadian district extending from Saskatchewan, Alberta, and British Columbia on the south to the Arctic Ocean, and from Keewatin on the east to Yukon. It is the largest division of Canada, but has not been fully explored. It contains the great Mackenzie river system in the west, whose deltas of great fertility are suitable to potatoes and vegetables grown during the short, warm summers. The forests are valuable in pine, spruce, tamarack, birch, and aspen poplar, the Douglas fir growing on elevations. Coal, salt, and iron are known to exist. The region is sparsely settled.

MACKENZIE RIVER. One of the longest streams of North America. It rises in the Rockies as the Athabasca river, falls into Lake Athabasca, emerges as Slave river, emptying into Great Slave Lake, from which it continues as the Mackenzie, navigable from that point to the Arctic Ocean during the summer. Its upper course is through a fertile and well wooded land.

MAINE. A New England state in the extreme northeast. The surface is generally hilly, becoming mountainous in the west and north. Its serrated coast line gives it the name of "the hundred harbored Maine." There are over 600 lakes and ponds, mostly in the plateau region, the south being well watered by the Saco, Androscoggin, Kennebec, and Penobscot rivers. They are of

little use in navigation, but invaluable for water power. Agriculture is limited, owing to forest lands on more than three fourths of the area, but the soil is exceedingly fertile in the Aroostook valley. The principal crops are oats, potatoes, sweet corn, buckwheat, hay, and apples. The lumber is mainly spruce, white birch, poplar, and cedar. Fisheries are valuable. The manufacturing industries are cotton and woolen textiles, paper and pulp, lumbering, varieties of canning, ice cutting, and shipbuilding. Minerals: feldspar, silica, granite, limestone, slate, tourmaline, some gold, copper, silver, iron, tin, and manganese, besides 26 mineral springs of importance. The railways connect with the Canadian systems. The capital is Augusta, with Portland the chief port, a great distributing center for meat products, cattle, cereals, and lumber.

MALAY ARCHIPELAGO. The largest system of island groups in the world, separating the Pacific from the Indian Ocean (exclusive of New Guinea). The principal groups are the Sunda Islands, including Sumatra, Java, Bali, Lombok, Sumbawa, Flores, Timor, and neighboring islands; Borneo, Celebes, the Philippines, Moluccas, and the western division of New Guinea. The archipelago practically belongs to the Dutch, with the exception of the Philippines, belonging to the United States, the British northern part of Borneo, the British island of Singapore, and the Portugese part of Timor.

MALAY STATES, THE FEDERATED. A large portion of the Malay Peninsula, consisting of Perak, Selangor, Negri Sembilan, Pahang, and Trengganu, a British protectorate. The staple products are cocoanuts, rice, rubber, sugar, tapioca, coffee, pepper, gambier, and nipa palm. There are valuable forests with good lumber, besides gutta-percha, oils, resins, canes, and fruits. Minerals: tin, some gold, lead, iron, bismuth, copper, mercury, arsenic, manganese, plumbago, silver, and zinc. Imports: rice, petroleum, opium, bran, flour, and sugar; exports: tin, padi (unhusked rice), rubber, copra, tapioca, gambier, and coffee.

MALTA. An island in the Mediterranean belonging to Great Britain, one of the most important ports of call in the world, and the repair and refitment base for the British fleet in the Mediterranean. The grand harbor is at Valetta, the capital. The staple industries are agriculture and cattle raising; oranges, figs, grapes, mandarins, onions, honey, and maize being grown. Cotton goods, silver filagree, and matches are manufactured. Minerals: marble, alabaster, and building stone.

MANCHURIA. The northeastern part of the Chinese republic. It was formerly of much greater extent, but the encroachments of Russia have reduced it. The eastern part consists of huge mountainous masses with many fertile valleys. To the south is the great plain of the country, the surface of which is varied by hills and valleys, and some swampy districts, but is of great agricultural value, having only about one fifth of its area under cultivation. There are large crops of pulse, barley, wheat, millet, maize, rice, cotton, indigo, tobacco, sesame, opium, ginseng, and rhubarb. The immense grazing lands would support tremendous herds of cattle, but stock raising is totally undeveloped. The mountains are still covered with forests. Manufacture of oil, oil cake, and the manipulation of wild silk are pursued. Gold is found in all the provinces, and is mined by the government in several places. Silver, copper, and lead exist, and coal, iron, and soda are worked to a limited extent. Mukden is the capital; the commercial ports are Niuchang, Port Arthur, and Dalny.

MANITOBA. A Canadian province, north of the American states of Minnesota and North Dakota; a part of the Great Prairie region, broken into hills in the northeast, gradually wooded to the north; terminating in dense pine forests in the northwestern parts, and watered by the Red river and its tributaries. There is poor soil in the east and in the hills to the west, but the Red river valley, and a great portion of the western plain are extremely fertile, and famous for their enormous production of fine wheat. The leading crops are wheat, oats, barley, flax, hay, and clover (the area of the grain crops increasing phenomenally); poultry and dairy products are important. It is the smallest in area but most advanced in development of the western divisions of the Dominion. Winnipeg is the chief city.

MARAJO ISLAND. A large island formed by the estuaries of the Amazon and the Para, and the network of river arms connecting them. It is about 165 miles long and about 120 miles wide. There are excellent grazing lands and large forests of rubber trees. There is little cultivation of any kind, the inhabitants being mainly hunters.

MARYLAND. A Middle Atlantic state. The surface consists of a coastal plain, the Piedmont plateau, and a part of the Blue Ridge Mountains in the west. It is drained by the Potomac, Patapsco, and several other rivers. It is an agricultural state, having four fifths of its area under cultivation, mostly farmed by the owners. The soil is light and loamy, unsuited to grass, but ideal for vegetables and small fruits. The staple crops are maize, wheat, hay, potatoes, fruit; about half of the tomatoes canned in the United States; also great dairy and poultry produce. The fisheries are valuable, producing more oysters than any other state. Other industries: canning (fruit, vegetables, oysters, etc.), copper smelting, meat packing, shipbuilding, petroleum refining, flour and grist milling, manufacturing iron, tobacco, textiles, cotton duck, lumber products, and fertilizers. Minerals: coal, building stone, iron ore, sand, talc, slate, lime, and natural rock cement. Baltimore is one of the best ports on the Atlantic coast, exporting wheat, flour, meat, provisions, cattle, cotton, and dried fruits, mainly from the Central and Western states. Annapolis is the seat of the United States Naval Academy and the capital of the state.

MASSACHUSETTS. A New England state, having an irregular coast line of about 300 miles. The surface of the western half of the state is mountainous, sloping eastward to the Connecticut river and undulating to the ocean. Rivers are numerous, unimportant to navigation, but valuable for water power. The soil is the débris of granitic hills, and yet too new for general cultivation, although extremely fertile areas exist in the Connecticut valley, and alluvial sections—therefore agriculture is limited. Nearly one quarter of the total crop is vegetables, with small fruits; tobacco is extensively grown in the Connecticut valley, and floriculture is yearly more important. This state leads in fishing, and the manufacture of boots and shoes, cotton and woolen goods. Other manufacturing products are foundry and machine shop products, paper, wood pulp, leather, bricks, pottery, and clay products. Few minerals are worked, including some coal, asbestos, talc, soapstone, infusorial earth, emery, granite, sandstone, trap rock, marble, and limestone. The capital is Boston, and it is one of the largest ports for valuable foreign trade, exporting provisions, cattle, oats, cotton, breadstuffs, leather, iron and steel manufactures, paper goods, and apples. Worcester, Fall River, Cambridge, Lowell, Lynn, are also important.

MAURITIUS. An island in the Indian Ocean which, with its dependencies, is a crown colony of Great Britain. The surface is mountainous, but has a fertile, if somewhat stony soil. Cane sugar is the agricultural staple, with minor products of cereals, spices, indigo, drugs, and tea. Imports: cotton goods, coal, machinery, fertilizers, ironwork, and soap; exports: unrefined sugar, rum, vanilla, aloe fiber, molasses, cocoanut oil, and hemp. The capital and chief port is Port Louis.

MEDITERRANEAN SEA. The largest inclosed sea in the world. It is 2,300 miles long by 100 to 600 miles wide; is connected with the Red Sea by the Suez Canal, and by the Strait of Gibraltar with the Atlantic. Gulfs, bays, and seas indent its coasts, of which the Adriatic Sea is the largest. Shallow banks below Italy, with the peninsula divide the sea into two basins, the various parts of which have special names. There are many islands, including Sardinia, Corsica, Balearic, Lipari, Sicily, Malta, Cyprus, Crete, the Ionian and Grecian archipelagoes. It is frequently visited by earthquakes, and Vesuvius, Stromboli, and Etna are active volcanoes. Few great rivers enter it. Its African coast is regular, the European extremely broken. It is usually called a tideless sea. Extensive red coral and sardine, tunny, and sponge fisheries exist. This inland sea is commercially the most important waterway of the world. The Adriatic Sea between Italy and the Balkan peninsula has an even, low western coast, a marshy northern coast, and a steep, rocky, barren eastern coast with many inlets and rocky islands. Its navigation is safe, and rich fisheries are worked. Venice and Trieste are the chief ports.

MESOPOTAMIA. The territory lying between Persia and Arabia on the Persian Gulf, an independent state under the mandate of Great Britain. The country depends upon irrigation for its moisture and if money could be spent on projects, the area between the Euphrates and the Tigris rivers would again "blossom like the rose." As it is now, parts of the country are very barren. The crops are wheat, cereals, clover, dates, rice and cotton. The area is one of the great oil regions of the world. Carpets and grain are the chief exports. Bagdad is the chief city on the Tigris river and its capital.

MEXICO. A federative republic immediately south of the United States, between the Pacific Ocean and the Gulf of Mexico. The surface is mainly an immense table-

land rising steeply from the coast lands, but gradually from the lower Rio Grande, to an interior plateau dominated by mountains at each coast. The rivers are unimportant to commerce, the longest being the Rio Grande, forming part of the boundary with the United States. The climate varies according to location; one may start from Puebla with green wheat shoots showing in March, farther along the railway finding ripened wheat, and farther still, threshing. Agriculture is important, but very primitive. Crops: wheat, maize, henequen (fiber), sugar, oranges, coffee, beans, cotton (dependent on irrigation), dyewoods, and rice. Farm animals are raised widely. Metallurgical works and cotton and tobacco manufactures are important. It is one of the largest mining countries in the world. Silver is found in 24 out of 31 divisions, either alone or in combination, and other minerals are gold, copper, lead, zinc, quicksilver, tin, and antimony. Imports: iron, steel, coal, carriages, wood manufactures, locomotives, and foodstuffs; exports: silver, gold, henequen, hides, and manufactures. The capital is **Mexico**, and the chief ports **Vera Cruz, Acapulco, Tampico, Progreso, Mazatlan, and Tehuantepec.**

MICHIGAN. One of the Central states, divided by Lake Michigan into two peninsulas. It has a long coast line and many good harbors. The surface is level, except in the north, and well watered by small rivers. The soil is very fertile, except in the northern portions, and about two thirds of the cultivated area is improved land. Crops: maize, wheat, oats, sugar beets, hay, rye, with large quantities of vegetables and fruits, peaches, plums, apples, etc. Stock raising is still important. There are large forests of white pine, hemlock, maple, elm, basswood, ash, and white oak in the north. Lumbering is the second great industry. Metal working, machine making, slaughtering and packing, milling, and dairying are important. Minerals: immense deposits of iron ore, copper, and asbestos, salt, gypsum, clays, Portland cement, graphite, sandstone, and limestone occur, besides mineral waters and some petroleum. The capital is **Lansing**, with important cities of **Detroit, Grand Rapids, and Saginaw.**

MINNESOTA. A Central state lying on the border line of Canada. The surface is rolling in the north, covered with dense forests of pine; northeast lie swamps and lakes, and to the south, prairie. The drainage system includes the Mississippi, Red, Minnesota, and St. Louis rivers. The soil is a rich, black loam, except in the northeast and north central counties. About one half of the total area is farms. Crops: maize, wheat, oats, barley, and flax. Stock raising is considerable. Manufacturing boots and shoes, clothing, metal goods, and machinery; milling and dairying are valuable. Minerals: iron ore, rich in red hematite, good granite, sandstone, limestone, and clays. The capital is **St. Paul**, and leading cities are **Minneapolis**, important as a grain center, **Duluth, Winona, and Stillwater.**

MISSISSIPPI. A Southern state. The surface is mountain ridges in the north, grading to rich alluvial river bottoms, which constitute some of the finest cotton land in the world. It is well drained by the Mississippi and its tributaries. The climate is semi-tropical, with agriculture the staple industry. Crops: cotton, maize, rice, wheat, oats, tobacco, and vegetables. It is the third cotton state. The fisheries are mainly oyster and shrimp. There are considerable forest areas not yet exploited. Manufacturing is not well developed, and mainly lumber, cottonseed oil and cake, canned oysters, and fertilizers are the products. There are practically no mining enterprises, but there exist hydraulic limestone, coal, gypsum, and clays. The capital is **Jackson**, with leading cities of **Vicksburg, Meridian, and Natchez.**

MISSISSIPPI RIVER. The principal river of North America, including the Missouri, is the longest river in the world. It rises in the Minnesota highlands in Lake Itasca and empties into the Gulf of Mexico, over 1,400 feet below its source. It drains the entire western slope of the Appalachians, and nearly all the eastern slope of the Rockies. Its drainage basin covers about one third of the total area of the United States. It is navigable to the Falls of St. Anthony at Minneapolis, about 2,100 miles. Its navigable tributaries are the Missouri, for about 2,300 miles in the flood period, the Arkansas, the Red, and the Ohio rivers. The total navigable length of the river and its tributaries is about 20,000 miles. The Missouri River is formed in southwest Montana by the confluence of the Jefferson, Madison, and Gallatin rivers. It flows across Montana, North Dakota, South Dakota, and Missouri, joining the Mississippi 20 miles above St. Louis. It is a swift, muddy stream, navigable only by flat-bottomed steamboats.

MISSOURI. A Central state whose surface is mainly rolling plains, rising gradually south of the Missouri river, which divides it. The southeastern part of the state is marshy bottom lands, protected by levees. The entire state is well drained; the climate is mild, but subject to long droughts. Agriculture is the chief business. Crops: maize, wheat, hay, oats, rye, sorghum, cotton, flax, tobacco, vegetables, and small fruits, peaches, and apples are increasing in product phenomenally. There is considerable stock raising, especially hogs and sheep. Dairying interests are important in milk, butter, and cheese, and much honey is gathered. The forests are cypress and white oak. Slaughtering and packing, tobacco manufacturing, milling, brewing, printing, lumbering, and machine making are valuable industries. Minerals: coal, red and brown hematite iron ore in quantity, zinc, lead, Portland cement, cobalt, nickel, barytes, limestone, granite, etc. There is important water and railway traffic all through the state. The capital is **Jefferson City**, and the chief cities **St. Louis, Kansas City, and St. Joseph.**

MONACO. An independent principality, and the smallest state in Europe. Its area is about eight and one half square miles, and practically consists of the capital, **Monaco**, of **Monte Carlo**, and of the village of **Condamine**, which lies between the two towns.

MONGOLIA. A colony of the Chinese republic in central Asia, extending over a large area. It is mainly a vast gravelly plain, intersected by low hills. In the west and in the northeast sections are wide, grassy plains, which merge into the rich pasture lands and wooded country. In the south it is fertile, rolling, and well forested. With the exception of the sterile Gobi plateau the country is well watered and drained, some of the lakes being brackish, from which thousands of tons of salt are obtained. In southeast Mongolia are grown crops of indigo, rice, cotton, opium, and cereals, but in central Mongolia only small quantities of wheat, oats, buckwheat, and millet are produced, and in the northwest there is little agriculture, except in the vicinity of the lakes and along the lower courses of the rivers. There are many fur bearing animals, and also droves of wild camels, ponies, asses, and mules. The chief industry is the breeding of horses and the rearing of cattle and sheep. Felt and certain woolen goods are produced, and there is some silk weaving. Chief exports: wool, skins, hides, furs, etc. **Urga** is the chief town.

MONTANA. A Western state, bounded on the north by Canada. It is the third largest in size. The eastern three fifths is rolling plain, sloping to the mountain ranges, which are intersected by broad valleys. The state is drained by the Missouri and Columbia rivers, but in many sections irrigation is necessary, and the government is equipping nearly 500,000 acres with irrigation facilities nearing completion. The rainfall is only 12 inches per annum, and agriculture is somewhat undeveloped. Crops: wheat, barley, oats, potatoes, and much small fruit. Cattle raising and ranching are important in the valleys, and the wool clip is the greatest in the country. Other industries are copper smelting and refining, lumbering, flour and grist milling, brewing, and slaughtering. Minerals: copper, coal, silver, gold, stone, and iron ore, zinc, tungsten, corundum; mineral waters and sapphires are valuable products. The capital is **Helena**, with chief cities of **Butte, Great Falls, and Anaconda.**

MOROCCO. A Mohamedan Empire, acknowledging protection of France except in Tangier which is internationalized. The surface is generally mountainous, with depressions. The agriculture is primitive with some stock raising. Crops: maize, barley, wheat, olives, dates, oranges, figs, and numerous vegetables. Minerals: rich in copper and iron ore, some antimony and rock salt, but all unworked, owing to prejudice against foreigners. Manufactures: textiles, carpets, metal goods of copper, brass, and silver filagree. Imports: cotton, sugar, tea, flour, hardware, wines, and candles; exports: barley, hides, beans, fruits, olive oil, wool, eggs, slippers, canary seed, flaxseed. The capital is **Fez**; chief port **Tangier.**

NEBRASKA. One of the Central states. It is a part of the great plateau east of the Rockies, with much soil of a rich, black mold, drained by the Missouri and tributaries. Irrigation is necessary in many sections, and large Federal plants are nearly completed. The eastern part of the state produces most of the crops, which are maize, wheat, oats, sugar beets, chicory and fruits. Large herds of cattle, sheep, swine, and horses are nourished on the bunch grass, which withstands the drought. Slaughtering and meat packing, brewing, flour and grist milling, and dairying form nearly seven eighths of the total manufacturing, the lack of cheap fuel being a handicap, besides the fact that there are no minerals except clays and some building stone. **Lincoln** is the capital, and **Omaha** the chief town.

IRRIGATION—I

1 Los Angeles aqueduct, 233 miles long; 60 miles in open canal, 98 miles covered conduit, 43 miles of tunnel, 12 miles of steel siphon. Cost $24,000,000. 2 Irrigation ditches, orange groves, California. 3 Irrigation ditches, Australia. 4 Gravitation irrigation on hill slopes in China. 5 Flume and canal paralleling each other, Boise, Idaho. 6 Large irrigation feed ditch, Riverside, California.

Photos 1 and 2 by Burton Holmes, from Ewing Galloway; 3 and 4 from Ewing Galloway; 5 by De Cou, from Ewing Galloway.

IRRIGATION—II

1 "Shadufs" or bucket lifts, Nile, Egypt. 2 Horse-pump, Budapest, Hungary. 3 Bamboo water-wheel, China. 4 Treadmill cup belt, Soochow, China. 5 "Sakieh" or chain bucket pump, Karnak, Egypt.

NEPAL. An independent state on the southern slope of the Himalayas. The southern portion, called the "terai," a strip of level land, is partly covered with forests and well cultivated. The remainder of the country merges into the Himalayas, and contains some of the highest mountains in the world, such as Mounts Everest and Dhaulagiri. It belongs to the basin of the Ganges. Agriculture is the staple industry, but is carried on under the most primitive methods, owing to the scarcity of agricultural land. Hill slopes, ledges, even when difficult of access, are utilized, and the irrigational methods are exceedingly ingenious. Crops: rice, wheat, pulse, maize, sugar cane, and vegetables in the central valleys, and in the "terai" region tea, cotton, tobacco, etc. Many European fruits have been successfully introduced. Imports: cotton and woolen piece goods, raw silk and cotton, leather, silver, brass, copper, iron, spices, salt, sugar, petroleum, cattle, sheep, and goats, many of which are re-exported to Tibet; exports: rice, oil seeds, cattle, hides, opium, resins, jute, dyes, saltpeter, drugs, tobacco, timber, and ghee. Manufactures: coarse cloth, paper, brass bells, and utensils. The capital is Kathmandu.

NETHERLANDS or HOLLAND. A European country bordering on the North Sea. It is the flattest part of the continent, a region of plains broken only by dunes and low hills. One fifth of the area is unproductive, the most fertile tracts being reclaimed from the sea. There are many small streams, but the important rivers are all in the south,—the Rhine, the Meuse, and the Scheldt; many canals connect the rivers, so it is possible to travel throughout Holland by water. There is little forest land. Crops: rye, potatoes, oats, wheat, beets, large quantities of bulbs, and shrubs. Cattle raising and dairy farming are almost without an equal. Fisheries are important, especially for oysters. There are a few coal mines. Imports: cereals and flour, iron and steel, textiles and copper; exports: textiles, iron and steel, copper, vegetables, dairy produce, distilled spirits, cereals and flour, paper, honey, eggs, and horses. Manufacturing industries: distilling, sugar refining, salt refining, brewing, and diamond cutting. The capital is Amsterdam, built on 90 islands, connected by many bridges, with chief ports of Rotterdam and Flushing. The colonial possessions in the East and West Indies are extensive. The Dutch East Indies represent the southern and eastern part of Borneo, the Celebes, Java, the western part of New Guinea, Sumatra, Timor, and other islands in Malaysia. Exports: sugar, coffee, tea, rice, indigo, tobacco, tin, cacao, trepang, copra, pearl shell, sandalwood, gold, and pearls. The Dutch West Indies include Curacao with neighboring islands, Bonaire, Aruba, St. Martin, St. Eustache, and Saba, exporting orange peel, salt, phosphate of lime, and hides; Dutch Guiana, or Surinam, exporting coffee, rum, molasses, and gold, is on the north coast of South America. Paramaribo is the capital.

NEVADA. A Western state, mainly in the Great Basin between the Sierras on the west and the Wasatch on the east. The Humboldt is the principal river, but much of the south central and southwestern portions are without rivers. The soil is fertile under irrigation, and Federal plants supplying over 160,000 acres are to be at work soon. The rainy season covers the level plains, for hundreds of square miles, with water up to two feet deep, producing hardened mud flats. Agricultural development has been retarded by lack of transportation facilities, and of local markets, but there are good stock raising ranches. Manufacturing: flour and grist milling, car making and repairing, dairying, and brewing. Minerals: immensely rich deposits of silver and gold, including the Comstock lode; copper, lead, zinc, coal, and iron ore are mined. The capital is Carson City.

NEW BRUNSWICK. An eastern province of the Dominion of Canada on the Gulf of St. Lawrence. The surface of the eastern half is a low triangular plain inclosed by ridges, much of the western and southern areas being plateau. The river St. John, and numerous small lakes and streams connect with the Gulf of St. Lawrence. The soil, especially in the valleys, is generally fertile, but agriculture is not fully developed. Crops: oats, buckwheat, wheat, potatoes, turnips, and other roots; there is considerable stock raising, dairying, poultry raising, fruit growing, bee culture, lumbering, manufacturing of wood pulp, and shipbuilding. Large forest areas include spruce, pine, tamarack, maple, beech, ash, birch, and elm. Excellent salmon fishing is found in several of the rivers. Minerals: iron, nickel, antimony, manganese, gypsum, plumbago, grindstone, limestone, and valuable freestone, with some coal. The capital is Fredericton, and the chief port St. John.

NEWFOUNDLAND and LABRADOR. A British colony in North America, distinct from Canada, comprising the island of Newfoundland and its dependency, Labrador. The surface is an undulating plateau of moderate elevation, traversed by ridges. It is well watered, but the rivers are not navigable except by canoes. There is a very large area of good agricultural land, but only a small part under cultivation. Crops: potatoes, turnips, hay, barley, oats. There are good pine forests at the north. Industries: fishing and making paper and pulp products. The country is rich in minerals: iron ore, copper, coal, gold, silver, and lead. Imports: flour, textiles, coal, salt pork, and molasses; exports: dried fish, fish oils, iron ore, canned fish, sealskins. The capital is St. John's.

NEW GUINEA or PAPUA. A large island north of Australia, the southeast portion being British, the northeast, formerly German, (Kaiser Wilhelm Land) is now administered by Australia and the larger portion in the west, Dutch. British New Guinea has many thousand acres leased to planters. Crops: cocoanuts, rubber, sisal hemp, coffee, Murva fiber, cotton, vanilla, kapok, tapioca, cinnamon, tea, and tobacco. There is much valuable forest land producing sago palm, sandalwood, cypress, ebony, gums, and rattan. Minerals: gold and copper are worked. Imports: foodstuffs, cloth, and hardware; exports: copra, pearl shells, gold, copper, pearls, and woods. Port Moresby is the chief port. Dutch New Guinea has no towns or centers.

NEW HAMPSHIRE. One of the New England states. The surface is rough and mountainous, culminating in the romantic White Mountains. The state is well watered and drained, supplying tremendous water power to cities. About three fifths of the area is forest. The valleys are very fertile. Agriculture, quarrying, and manufacturing are leading industries. Crops: hay, corn, potatoes, oats, great quantities of apples, and some tobacco. Manufactures: boots and shoes, cotton and woolen goods, carriages, and paper. Minerals: granite, mica, scythe stones, copper, ores of lead, zinc, tin, arsenic, iron, and some gold and silver. The capital is Concord, with leading cities of Manchester, Nashua, and Dover. Portsmouth is the only seaport.

NEW JERSEY. An important Middle Atlantic state. The surface slopes from the northwest corner to the coastal plain of the Atlantic. The principal rivers are the Passaic, Hackensack, and Raritan. The valley soil is fertile but only about three fifths of the area is under cultivation. Agriculture, market gardening, fruit growing, horticulture, and forestry are pursued. Products: maize, wheat, oats, vegetables, fruits (especially peaches), small fruits, particularly strawberries, and flowers. There are valuable fisheries of trout, perch, black bass, shad, sturgeon, menhaden, and oysters. Minerals: magnetic ore, granite, trap rock, sandstone, limestone, Portland cement, clays (fine porcelain, tile, and brick), talc, soapstone, also mineral waters. Manufactures: textiles, silks, worsteds, cottons, woolens, canned goods, felt hats, porcelains, machinery, jewelry. The capital is Trenton, with chief ports of Hoboken, Jersey City and Newark. Jersey City is the terminus of several great railroad and steamship lines.

NEW MEXICO. One of the new Western states. The entire surface lies very high, only a small section in the south lying below 4,000 feet. Through the western part stretches the great plateau of the Continental Divide; the eastern part belongs to the Great Plains, the land rising westward of the Pecos valley into the front range of the Rockies. The soil is fertile, but needs irrigation, which is extending; the total area will finally cover about one million acres. Crops: alfalfa, cereals, vegetables, fruit, cotton. It is a great sheep grazing country, and also has many cattle. The national forest area includes an enormous tract of sycamore, cottonwood, oak, pignon, dwarf cedar, while extensive forests of pine, spruce, and cedar cover the higher lands. Other industries: car construction and railroad repair work, lumbering, flour milling, manufacturing woolens, cement preparing, and wool scouring. Minerals: copper, coal, silver, gold, lead, zinc, kaolin, turquoise, etc., but all comparatively undeveloped. The capital is Santa Fe.

NEW YORK. A Middle Atlantic state. The wealthiest and most populous state. The greater part of the surface is plateau and rolling plains, with the Adirondack Mountains in the east; south of these are the Catskills cut by the Hudson river, the vast plain covering more than one third of the state. There are many small rivers supplying the main systems of the St. Lawrence and Hudson. The state has large agricultural interests, including large truck farms, important fruit growing, and extensive floral culture. Crops:

maize, wheat, oats, potatoes, hay, tobacco, some sugar beets, fruit, hops. The value of the fisheries is decreasing, but is still large, and oysters constitute about one half the total. Other industries: clothing and textile manufacturing, sugar refining, foundry and machine shop work, slaughtering, printing and publishing, mining and quarrying. Minerals: iron, talc, petroleum, natural gas, clays, granite, trap rock, sandstone, marble, limestone, slate, Portland cement, salt, infusorial earths, emery, and garnet. The capital is Albany. The chief city is New York, the largest shipping port in the world, and the metropolis of the United States with one of the finest harbors in the world; the upper and lower bays covering about 100 square miles. There is a water front of 22 miles on Manhattan Island, but the total water front of the port is several times larger. There are five bridges connecting with Long Island, two tunnels to Jersey City, and the ferry system is the best in the world. Exports are largely grain, flour, cotton, tobacco, apples, fruits, preserved provisions, meats, and cattle. Other important cities are Buffalo and Rochester.

NEW ZEALAND. A British dominion in the South Pacific Ocean, consisting of two large islands, one small island, and a group of outlying islets attached to the colony. The surface of North Island is gently undulating, with a number of volcanic peaks. South Island has no volcanoes, but has a rugged range of the Southern Alps along the western coast, with magnificent scenery. The rivers are small and unimportant. Agriculture and grazing are the staple industries, sheep being a great factor. Crops: oats, wheat, barley, hay. Dairying is by the factory method, through the co-operation of small farmers. Imports: clothing and materials, iron and steel goods, sugar and fruit; exports: wool, frozen meat, kaurigum (resin), dairy products, gold, hides, horns, bones, and a native grass fiber. Other industries: meat freezing, wool scouring, tanning, saw and grist milling, dairying, manufacturing of clothing, boots and shoes, iron and steel. Minerals: gold, coal, some silver and silver lead. The capital is Wellington, which, with Auckland, is one of the two chief ports. Attached to New Zealand are the uninhabited Auckland Islands, Chatham Islands, the Cook, and other islets, producing copra, pearl shell, fruit, hats, and lime juice.

NICARAGUA. The second largest Central American republic. The surface is divided into distinct zones by two mountain ranges, between which lies the great interior basin where population and industries are centered. It is well drained. The soil is fertile, but agricultural development is hampered by the scarcity of labor. Crops: coffee, bananas, cacao, sugar, tobacco, cotton, cocoanuts, black beans, rubber, maize, indigo, rice. The forests are valuable, containing cedar, mahogany, dyewoods, gum trees, and medicinal growths. Minerals: gold, coal, and oil are worked to some extent, and a number of other minerals have been located. Imports: cottons, food products, ironwork; exports: coffee, timber, gold, rubber, bananas, cattle, and hides. Manufacturing industries are unimportant. The capital is Managua, with other important cities of Bluefields, Corinto, and Greytown.

NILE. The longest river of Africa, and the second longest in the world, being about 3,670 miles long, with a source estimated at 6,114 feet above sea level. The area of the Nile basin is estimated at about 1,780,000 square miles. Little of its enormous volume of water reaches the sea, but is spread over the low lands of Egypt, fertilizing them with sediment and supplying moisture. It is divided into four sections: the Upper, Middle, Lower, and the Delta, receiving the Blue and the White Niles at Khartum. It is dammed just below Cairo, and at Assuan, to regulate the distribution of the water in the dry seasons. It has turned Egypt from an arid desert into a rich agricultural land, supporting about 600 inhabitants to the square mile, thus acquiring the name of "the gift of the Nile." Cairo is the chief city.

NORTH CAROLINA. A Southern state. The surface consists of the Appalachian Mountain region in the west, well-forested, which slopes from the foot of the Blue Ridge to the coastal plain, sandy and flat. It is intersected by rivers of valuable water power. There is abundant rainfall and good drainage. Agriculture is the staple industry. Crops: cotton, tobacco, maize, wheat, peanuts, potatoes, oats, and rye. There is some stock raising, with dairying industries on the increase. The shad and oyster fisheries are valuable. Manufactures: cotton goods, tobacco products, lumber, and flour. More cotton is manufactured than raised. The minerals are not important, mainly corundum, mica, bismuth, clays, granite and talc. The capital is Raleigh, and the chief port Wilmington.

NORTH DAKOTA. A Central state. The surface of the eastern part is level, watered by the Red river and its tributaries; it merges westward into rolling prairies, rising to a small forest-covered plateau. The soil is fertile and easily worked, but needs irrigation. Agriculture is the chief pursuit, and immense fields of wheat are cultivated, also oats, barley, flaxseed, potatoes, and hay; large numbers of horses, cattle, and sheep are raised. Flour and grist milling and dairying are limited in extent. Minerals: coal, clays, and cement, with some lime, salt, and iron. The capital is Bismarck.

NORTH SEA. A southern extension of the Arctic Ocean lying between Great Britain and the continent. It is connected with the Baltic Sea through a series of narrow channels, and with the Atlantic Ocean through a wide opening at the north, and southward through the Strait of Dover and the English Channel. It is 600 miles long and 400 miles wide, the greater proportion being less than 600 feet deep. At the south and east, the coasts are low and flat; at the north and west, the water is deeper and faced by high, bold cliffs. It has a very irregular bed containing many shoals and sand banks, made by the many rivers it receives, among which are the Thames, Humber, Forth, Rhine, Weser, and Elbe. From earliest times it has been one of the most important highways of the world, surrounded by some of the greatest nations. The fisheries, which provide employment for thousands of fishermen, are among the foremost in existence. The chief ports are Hamburg, Bremen, The Hague, Rotterdam, Antwerp, London, Hull, Newcastle.

NORWAY. A long, narrow coast country of Europe, which, with Sweden, makes the Scandinavian Peninsula. The deeply serrated coast presents about 12,000 miles of coast line. The surface is a rugged plateau. In the southeast and middle north are great forests of pine. Only a very small part of the area is under cultivation. Crops: oats, rye, barley, and potatoes, but not nearly sufficient for home demands. There are good grazing lands for sheep, cattle, horses, goats, swine, and reindeer. Lumbering is the great industry, and fisheries produce cod, herring, mackerel, salmon, sea trout, lobsters, oysters, walrus, seal, and shark. There is much valuable water power, but the country lacks industrial development. Minerals: silver, copper, and pyrites in small quantities. Imports: animals, breadstuffs, minerals, textiles, ropes and yarn, tallow, oils, exports: timber and wooden goods, animal products, fish, wood pulp, tar, paper and pulp, ice. The capital is Oslo, chief ports Bergen, Christiansand, Drontheim, and Hammerfest, the most northern town of Europe.

NOVA SCOTIA. A province of the Dominion of Canada. The surface is undulating, traversed by broken ranges of hills. It is adequately drained by a number of short rivers running southward. The valley lands are extremely fertile. Crops: oats, potatoes, hay, barley, wheat, buckwheat, rye, turnips, with large fruit areas. There are important progressive dairying, and increasing poultry products. One half the population is engaged in the valuable fisheries, deep sea, inshore, and inland. There is much rich timber, which is being extensively cut. Coal mining, manufacturing of coke, iron and steel, textiles, dairying, tanning, and canning are important. There is valuable water power. Minerals: rich coal, iron, gold, gypsum, limestone, and lead deposits. Cape Breton Island is part of the province, and Sable Island is a dependency. The capital and chief port of Nova Scotia is Halifax, exporting coal, lumber, fish, cattle, flour, potatoes, apples, butter, furs, and oils.

OHIO. A Central state. The surface is a low plateau, with a series of hills extending to the southwest. It is well drained and watered, and has a very fertile soil. Agriculture is one of the principal industries. Crops: maize, wheat, hay, potatoes, sugar beets, tobacco. There are extensive orchards, vineyards, and truck gardens. Horses, cattle, and sheep of a high quality are raised, and dairying is important. Other industries: manufacturing iron and steel goods, machinery, furniture, carriages, chemicals, flour and grist milling, and slaughtering. Minerals: coal, petroleum, iron ore, valuable clays, limestone, sandstone, Portland cement, salt. The capital is Columbus, and the chief cities Cleveland, Cincinnati, and Toledo with its good harbor facilities.

OKLAHOMA. A Western state which is rapidly developing. The surface is a rolling plain rising to an elevation on the western boundary; a range of hills runs through the central portion. It is well watered and drained by the Red river, the Arkansas river, and their tributaries. The soil is good, especially in the valleys. It is preëminently an agricultural and stock raising state. Crops: maize, wheat, cotton, potatoes, hay, flax, sorghum, barley, rye, broom corn, castor

beans, and fruits. The extensive cattle ranches are in the west. There is little manufacturing, mainly flour and grist milling, cotton ginning, making cottonseed oil and cake. Minerals: coal, petroleum, asphalt, gypsum, salt, limestone, sandstone, and granite. The capital is Oklahoma City.

OMAN. An independent sultanate at the southeast end of Arabia. It has a mountainous coast with rich central valleys extending to the desert. Dates are the chief crop. Imports: rice, coffee, sugar, piece goods, silk and silk goods, twist and yarn, cereals, arms, and ammunition; exports: dates, fruits, fish, mother-of-pearl, and pearls. The capital is Maskat, which has a large caravan traffic with the interior.

ONTARIO. The most populous province of the Dominion of Canada, containing about two fifths of the total population. The surface in the north is a plateau which divides the Hudson Bay system from that of the Great Lakes; in the south it is lowlands broken by a spur from the north uplands which forms the Thousand Islands and the high northern bluffs of Lakes Huron and Superior. It is well watered, has abundant water power, and an exceedingly fertile soil. It is an agriculutral state, with extensive fruit orchards and vineyards, besides important stock raising and dairying interests. Crops: oats, hay, wheat, peas, maize, barley, rye, buckwheat, roots. Valuable fur producing areas are in the north. The fisheries of the Great Lakes produce cod, herring, trout, whitefish, pickerel, etc. Minerals: immense nickel deposits, iron, copper, gold, silver, petroleum, natural gas, clays, limestone, sandstone, and building stone and marble. It is largely engaged in manufacturing farm implements, machinery, wagons, cottons, woolens, leather goods, etc. The capital is Toronto, with chief cities of Ottawa (the seat of government), and Hamilton.

OREGON. A Western state lying on the Pacific slope. It is a semi-arid area, there being good rainfall west of the Cascade Mountains, producing much highly fertile land, but east of the range irrigation, private and Federal, is being largely used, and further planned. It is traversed by the Columbia river and its tributaries, the Willamette, the Snake, and several small streams; the Columbia is navigable for ocean ships to Portland. It is largely given up to agriculture and lumbering. Crops: wheat, hay, oats, barley, flax, hops, sugar beets, potatoes. There are extensive orchards. There is active stock raising and also valuable fisheries of salmon (in the Columbia), sturgeon, halibut, and oysters. Manufactures: lumber and timber products, flour and grist, canned meat and fish, machinery, and wood pulp. Minerals: gold, copper, silver, coal, granite, and some quicksilver, gypsum, nickel, cobalt, lead, garnet, and opal. The capital is Salem, with Portland as the chief city and port.

ORINOCO. The smallest of the three great South American rivers, with a source about 1,000 feet above sea level. The total navigable length of the system is about 4,300 miles, but is little used, and the great natural wealth along its course is practically untouched. The main stream is almost wholly within Venezuelan territory, and periodically floods the country adjacent to the lower reaches. The plains through which it flows are called llanos, on which great herds of cattle are raised. This is also the cacao section.

ORKNEY ISLANDS. An archipelago lying to the north of Scotland. The island of Hoy is mountainous, but the surface of the remaining islands is low with irregular, rocky coast lines. There is an adequate rainfall, the climate is fairly mild, owing to the Gulf Stream, and the soil is fertile, producing barley, oats, potatoes, and turnips. Considerable cattle, sheep, and poultry are raised, and fishing is an important local industry. Exports: live stock, sea food, eggs, and poultry. The only towns are Kirkwall, the capital, and Stromness, which has a fine harbor for large vessels.

PACIFIC OCEAN. The largest of the five great oceans; lies between America and Asia, connecting with the Arctic by Bering Strait and to the south merging into the Southern Ocean. It is the deepest and the largest ocean, and has an area of about 67,570,000 square miles, about one half of the water surface of the globe. It has less land than the Atlantic draining into it. The largest American rivers are Yukon, Columbia, and Colorado; the Asiatic are Amur, Hoang-ho, and Yangtze. The greatest depth, 31,614 feet, is off the Island of Guam, reported by U. S. ship Nero. The currents are much less marked than in the Atlantic. The American and Australian coasts are mountainous and regular, the Asiatic low and fertile with numerous gulfs, bays, and seas, including Bering, Okhotsk, Japan, Yellow, South, and East China, with many volcanic islands. To-day many steamship lines and cables connect the two great continents and commerce is developing most rapidly.

PALESTINE. The coast land east of the Mediterranean, a part of Syria, occupied by the Philistines and later called the Land of Israel. A territory about 150 miles from north to south, 35 miles broad at the north and 110 miles at the south. Within this are the Sea of Galilee about 682 feet below sea level, the Dead Sea about 1,292 feet below, the bottom of which is estimated at 2,592 feet below the Mediterranean. The surface consists of hills and mountains to the west of the Jordan with its depressed valley and a plateau region lying east. It is poorly supplied with rivers. There is little settled population. Irrigation is necessary to produce fertility in most regions, and the herding of goats and sheep is the principal industry. Cotton, hemp, indigo, grapes and other fruits are raised in very rude fashion. Roads are being made, wagons replacing camels and mules, the railroad is appearing, and changes seem imminent. Jerusalem is the chief city; Jaffa the port.

PANAMA. A republic of seven provinces on the narrow strip of land between North and South America. The surface is mainly low mountains, divided by valleys, with some level, treeless plains, and lofty mountains to the west. The ranges are covered with dense forests. The soil is fertile and produces caoutchouc, bananas (the chief product), fruits, coffee, cacao, cocoanuts, copaiba, sarsaparilla, ipecac, sugar cane, indigo, rice, cotton, and vanilla. Industries: cattle raising, agriculture, and working on the Canal. It is claimed that every mineral but coal is found. Imports: woolens, cottons, coal; exports: cattle, hides, bananas, pearls, turtleshell, valuable woods, rubber, ivory nuts. The capital is Panama, an important Pacific port, Colon being the Atlantic port. The Canal Zone is a tract of land ceded by the republic to the United States, extending five miles on either side of the central Canal line, together with several islands in the Bay of Panama.

PARAGUAY. An inland, central republic of South America. The surface is a low, undulating plateau, crossed by chains of low ridges covered with dense vegetation. Between the ranges flow innumerable streams, the Parana, one of the largest rivers of the world, but of minor commercial importance, and the Paraguay river, navigable from Asuncion, the capital, to Buenos Aires. Agriculture is primitive, with important cattle raising. Crops: maize, wheat, rice, tobacco, oranges, manioc, beans, sugar cane, with some coffee, cotton, and ramie. Manufactures: brick and clay products, leather, furniture, and cigars. There are abundant but unworked deposits of iron ore, marble, copper, and other minerals. Imports: textiles and ironware; exports: hides, yerba maté or Paraguay tea, tobacco, animal products, lumber, and quebracho extract.

PENNSYLVANIA. A Middle Atlantic state. The surface to the southeast is a rolling upland adapted to agriculture, and north and west is a mountain system with many parallel ridges and valleys. It is well watered by the Delaware, Susquehanna, and Ohio rivers. Agriculture (market gardening), fruit growing, horticulture, stock raising, and forestry are pursued. Crops: maize, wheat, tobacco, oats, vegetables, and fruits. There is a considerable and varied forest area consisting of white oak, hickory, chestnut, walnut, cherry, sugar maple, white pine, hemlock, pitch pine, maple, beech, birch, spruce, balsam fir, and larch. It has immense iron, steel and rolling mill plants, is the largest leather center, the second largest woolen and silk center in the Union, and the largest carpet making center in the world; there are important locomotive works, textiles, coke, glass and publishing establishments, sugar refineries, and breweries. It is the most important mining state in the Union. Minerals: coal, iron, limestone, petroleum, slate, stone quarries, sandstone, clays, Portland cement, metallic paint, salt, also mineral waters. The capital is Harrisburg, with chief cities of Philadelphia, Pittsburgh, Scranton, Reading, Erie, and Wilkes-Barre.

PERSIA. The most important native kingdom of southwestern Asia, between the Caspian Sea, Persian Gulf, and Arabian Sea, called Iran by the natives. The surface is mainly a desolate arid plateau with exceedingly fertile mountain and coast valleys in addition to the plain of the Caspian. The Karum is the only navigable river, and then only for 150 miles. Agriculture depends on irrigation. Crops: wheat, barley, rice, fruits, silk, opium, gums, cotton, and tobacco. Domestic animals include good horses, the Persian lamb, goats, and camels. The country is rich in lead, copper, tin, iron, coal, salt, etc., but undeveloped by reason of poor transportation and the scarcity of fuel and water.

Manufactures are mainly carpets, rugs, and shawls, made by private individuals. The ancient ceramics were magnificent, but the art is almost obsolete. There is some good copper, glass, filagree work, and carving. Imports: cottons, woolens, sugar, iron and steel, cotton yarns, tea, gold, and petroleum; exports: wool, opium, fish, fruits, rice, rugs, carpets, shawls, woolens, silk cocoons, hides, and skins. The capital is Teheran, with chief commercial centers, Ispahan and Tabriz.

PERU. A progressive republic of South America crossed by the Andes, the Cordilleras, and the Sierras; the Montaña plain being extremely fertile and highly developed. It is well drained, but agriculture is largely dependent upon a good and steadily increasing system of irrigation. Crops: sugar, cotton, coffee, rice, sugar cane, tobacco, maize, ramie, and olives. It is the "home of the potato." The forests are large, and have important growths, rubber, valuable medicinal trees and plants, such as the cinchona, cacao, and coca. Manufactures are still unimportant. Imports: minerals, metals, cotton, woolens, wheat, coal, machinery, timber, and drugs; exports: wools of the alpaca sheep, llama, and vicuña, ores, sugar, coffee, hides, cocaine, and borax. The capital is Lima, with its port of Callao.

PHILIPPINE ISLANDS. The northern group of 1,725 islands in the Malayan Archipelago, ceded by Spain to the United States (1898). The interior is mountainous, with valleys and narrow plains, which broaden toward the coast, enriched by alluvial deposits. The drainage is a maze of rivers. It is a splendid agricultural area, but at present crudely developed by the use of poor tools. Farm animals and labor are scarce. Products: Manila hemp, sugar, coffee, rice, fruits, copra, tobacco, cacao, cocoanuts, indigo. There are wide areas of important forests containing valuable cabinet and other woods, timber, gums, dyewoods, spice growths, palm, and bamboo, these being under the supervision of the United States Forestry Bureau. Manufactures: cigars and cigarettes, fabrics of wool, hemp, cotton, silk, and piña fiber worked on hand looms. Imports: cotton, rice, meats, dairy products, cattle, flour, coal, iron, and steel; exports: hemp, copra, tobacco, cigars, gums, and resins. The capital is Manila, with a very good harbor, and the chief ports are Cebu and Iloilo.

POLAND. An independent state formed in 1918, just east of Germany and composed of three areas, Upper Silesia ceded by Germany, Galicia turned over by the Austrians and Congress Poland from Russia. With such a division the great difficulty will be in keeping unity within and protection without, because of no natural barriers. The country physically lies in the Great Central Plain of North Europe and is therefore a farming country. It lies in the heart of the rye-potato-sugar-beet belt. It raises also wheat, oats, flax and barley. The raising of swine and cattle is very important. About 25% of the land is forest covered and adds much to the national wealth. The country is rich in natural resources, large salt mines, one of the largest oil fields of Europe, potash, lead, zinc, and iron ore. Poland is a great textile manufacturing area, particularly at Lodz and Warsaw, wool, linen and jute comprise the major types with woodworking, metal working industries, oil refineries, in Galicia, and the refining of the beet sugar. Danzig, while an internationalized city is the only port that Poland has. The chief cities are Warsaw, the capital, Lodz, Posen and Cracow.

PORTO RICO. The smallest of the West Indies, ceded by Spain to the United States (1898). A low range of mountains runs through the center of the island, from which the land slopes north and south to the broad, level, fertile, alluvial coastal plains. The country is well drained, and there is abundant water for power and irrigation. Agriculture occupies more than half of the population on small farms crudely worked. There is poor transportation, but a steady improvement in every direction. Crops: coffee, sugar, tobacco, fruits, and vegetables. There are forests containing cedar, ebony, sandalwood, laurel, willow, dyewoods, and resins. There are large and unworked deposits of gold, silver, iron, copper, bismuth, limestone, tin, building sand, quicksilver, clays, guano, phosphates, etc. Imports: cotton, rice, provisions, flour, and wooden ware; exports: cigars and cigarettes, coffee, molasses, straw hats, hides, and fruit. Manufactures are mainly tobacco, cigars, and hats. The principal cities are San Juan, Ponce, Mayaguez, and Arecibo. Culebra has been made a naval base.

PORTUGAL. A small republic on the southwestern part of the Iberian Peninsula between Spain and the Atlantic Ocean. The surface in the north and northwestern part is mountainous and elevated, but south of the river Tagus (which divides the country from northeast to southwest) it is a succession of plains, hills, thinly-wooded lands, and coastal tracts suitable for agriculture. The country is well watered and drained by Minho, Douro, Tagus, and Guadiana rivers, most of these being navigable to the Spanish frontier. About half of the land is unproductive. Crops: wheat, barley, oats, maize, flax, rice, fruits, and vegetables. Manufactures: cotton, wool, and silk goods, wine, and olive oil. Minerals: important copper deposits, with arsenic, gold, lead, iron, manganese, wolframite, zinc (not greatly worked), gypsum, lime, and marble. Imports: wheat, codfish, iron, coal, raw cotton, sugar, machinery, hides, and rice; exports: wine, cork, copper, ore, fish (salmon, lampreys, sardines, and cod), olive oil, hides, fruits, tobacco, skins, salt, and vegetables. Lisbon is the capital, also a leading port; other ports are Oporto and Setubal. The possessions of Portugal in Africa are: Angola, exporting coffee, rubber, and dried fish. Large quantities of malachite, copper, iron, petroleum, and salt are obtained. Railroads are now being built to develop transportation; Cape Verde Islands, exporting coffee, hides, medicinal produce, and salt; East Africa, exporting rubber, various ores, wax, and ivory; Guinea, exporting rubber, wax, oil seeds, ivory, and hides; Prince's and St. Thomas Islands, exporting cacao, coffee, rubber, and cinchona. Possessions in Asia are Damao, Diu, and Goa, exporting grain, pulse and salt; Macao, an island on the southern coast of China, exporting tea, oils, silk, and rice; Madeira Islands, near Morocco, exporting Madeira wine; and the eastern part of Timor, in the Malay Archipelago, exporting coffee, wax, sandalwood, and sandalwood root.

PRINCE EDWARD ISLAND. The smallest province of the Dominion of Canada. It is situated in the Gulf of St. Lawrence, and has an undulating surface, a variable coast line of lowland and bluff, several good harbors, and only short tidal rivers. Two thirds of the land is cleared, and there is little unproductive soil. Crops: wheat, oats, turnips, hay, potatoes, barley, and buckwheat. There is considerable stock raising, dairying, poultry farming, and fishing. The manufactures are unimportant, and there are few minerals. The capital is Charlottetown.

PYRENEES. The mountain chain dividing France from Spain, 270 miles long, 15 to 70 miles wide, highest in the central part. It sinks on both sides to plains in a series of terraces, the steeper are on the Spanish side and contain many beautiful waterfalls. In the valleys are forests, grasses, vineyards, and olive groves. Minerals are not abundant, but there are many mineral springs.

QUEBEC. An eastern province of the Dominion of Canada. It has a good coast line on the Gulf of St. Lawrence, a strip of Labrador shielding it from the open sea. North of the St. Lawrence river the surface is rocky and broken; on either side the river run narrow lowlands, and to the eastward broken, hilly country. The land is well drained by the St. Lawrence system. Agriculture and dairying are the chief industries in the fertile valleys. Crops: oats, hay, wheat, buckwheat, potatoes, peas, turnips, and tobacco. Stock raising is being developed, and also fruit orchards producing high-class apples, etc. There are valuable forest lands of maple, oak, beech, elm, pine, cedar, spruce, and birch. There is a great fur industry, and the fisheries consist of cod, herring, lobster, and salmon in large quantities. Quebec unfortunately has no coal, but iron ore and copper are found, also plumbago, lead, platinum, limestone, granite, peat, some gold, pyrites, and graphite. There is an extensive tanning industry, besides a production of boots and shoes, wood pulp, cottons, matches, etc. The capital is Quebec. The chief port is Montreal, receiving over one third of the Dominion shipping, now center of the dairy product export trade, and reaching out to develop the future wheat supply of the world.

RED SEA. An arm of the Indian Ocean separating the Arabian peninsula from northeastern Africa, 1,300 miles long, 100 to 200 miles wide. The Suez Canal unites it with the Mediterranean and the Straits of Bab-el-Mandeb with the Indian Ocean. The Arabian coasts are sandy deserts with barren mountains behind; the Egyptian coasts are flat, sandy plains to the north and high table-lands to the south. Each shore is marked by high coral reefs, which have produced numerous islands. No rivers flow into it, little rain falls, so its waters are extremely salt. The Red Sea has been a highway of commerce between India and the Mediterranean countries since ancient times, lessening its trade when the direct route to India was discovered, but regaining it when the Suez Canal opened, so that it is the main route between Europe and the East.

RHODE ISLAND. A New England state, the smallest in the Union. The greater part of the surface is rough and hilly, and the state limits include a number of beautiful islands, on one of which is Newport. Agriculture claims more than half of the total area, with crops of maize, oats, hay, forage, fruits, and vegetables. It is a manufacturing state, with manufactures of worsteds, cotton, woolen, rubber, and elastic goods, silverware, jewelry, foundry and machine shop products, and dyes. Oysters are a valuable fish product, and minerals are graphite, talc, limestone, and building stone. The capital is Providence.

RIO DE LA PLATA. One of the twelve great rivers of the world, in the southeastern part of South America, where it drains the pampas, the vast grass and grain region. It is the outlet for an enormous body of water during the heavy floods of the section. It is 143 miles wide at the mouth, and decreases in width for 200 miles inland, extending about 2,300 miles to its source. The quantity of alluvial matter brought down by the floods is slowly choking the estuary through which the waters of the Parana and Paraguay rivers sweep to the sea. Its best natural harbor is at Montevideo, with artificial harbors at La Plata and Buenos Aires.

ROCKY MOUNTAINS. The eastern ranges of the great western plateau and mountain system in North America, stretching continuously from the southern border of the United States through Canada to the Arctic Ocean. In the United States these ranges are divided by cañons and flexures into many plateaus. In Wyoming they are divided into a northern and a southern group; in this divide are the sources of the Colorado, Columbia, and Mississippi rivers. The ranges of the southern group are the higher, and contain several elevated valleys in Colorado, called "parks," which furnish excellent pasturage. Near here are more than 40 peaks 14,000 feet high, which give rise to the Platte, Arkansas, Grand, and Rio Grande rivers. The mountains of the northern group are wider and less accessible, but not so high. Yellowstone Park is located there. Mount Hooker and Mount Brown are the highest peaks beyond the Canadian line. The highland gradually descends to 800 feet near the Arctic Ocean. Gold, silver, lead, and copper abound, while petroleum and natural gas are obtained.

ROUMANIA or **(RUMANIA).** A kingdom of Europe. The northeastern Balkan state. The surface consists of rugged mountains and highly fertile plains of black loamy soil, well drained and watered by the Danube. Three quarters of the population are engaged in agriculture. Crops: maize, wheat, oats, barley, grapes, plums and small fruits, some colza, flax, hemp, and sugar beets. Stock raising is extensive. Forests cover one fourth of the country, with oak, beech, and pine predominating. Minerals are mainly rich deposits of coal, petroleum, and salt, with many unworked and valuable varieties. Imports: textiles, metal manufactures, colonial produce, hides, wax, oil, cereals, and animal products; exports: cereals, woods, petroleum, vegetables, and chemicals. The capital is Bucharest, with chief ports of Braila, Constantza, and Galatz.

RUSSIA. Once the great eastern empire of Europe, still the largest state, Russia became a Soviet republic in 1917, governed by the All Russian Congress of Soviets. The country before the war had an area of approximately 8,420,000 square miles but is about 15% less now through the loss of Finland, Esthonia, Latvia, Lithuania, Bessarabia and part of Poland. Besides these above, Georgia, Ukraine and Azerbaijan have declared themselves republics but are really still under the Soviet influence and jurisdiction. From a physical point of view the country can be divided into four provinces, the tundra, the northern area, frozen, uninhabitable, and economically unimportant, the forest area, from the southern edge of the tundra to Moscow, dairying, agriculture and timber area, the steppe region, from Moscow to the Black Sea, the famous black earth region, great wheat and farming area and the region around the Caspian Sea, arid or semi-arid, part of it below sea level. Practically the entire area of Russia is a plain, about 1000 ft. above sea level. The climate is continental, that is great extremes, the rainfall decreasing as we go toward the east. There are a great many lakes and swamps due to glacial action. The Volga, in the east, the longest river in Europe, flowing into the Caspian Sea, the Don, the Dneiper and the Dneister in the south all flowing into the Black Sea and the Dvina in the northeast, flowing into the White Sea—all these and many smaller ones help to make the river transportation very good and to help the country commercially. One great drawback that Russia has, is the lack of ice free ports on the open sea. The north is closed in winter, Vladivostok to the east is kept open with difficulty only and to the south, the Black Sea outlet is controlled by Turkey through the Bosphorous. Russia is probably more thoroughly an agricultural nation than any other European nation, three-fourths of its people earning their livelihood by the soil. The crops are wheat (the second largest producing country in the world), rye, oats, potatoes, sugar beets, hay, barley, hemp, and tobacco. Russia produces a great many horses, sheep, goats, cattle and hogs. If Russia would once wake up and really cultivate her land intensively on a modern scale, she would soon outstrip all her competitors in a great many lines. About forty-five per cent. of the entire area of Russia is forested, mostly conifers and is one of the great resources that up to the present is undeveloped. There are two important mineral areas in the country, the Caucasus Mountains to the south and the Ural Mountains region to the east. In the south is located the great Baku oil field, one of the greatest in the world, also copper, zinc, managanese and iron, and to the east the Ural Mountains, with their gold, copper, a little coal, and platinum (95% of the world's supply). Manufacturing is very backward due to type of people and lack of technical education. The list of products includes iron, machinery, textiles, clothing, coal, oil, food products, glass, pottery and leather goods. The exports are almost wholly raw materials and natural resources, timber, food products, flax, ores, hides, and skins. The chief cities are Petrograd, the former capital, on the Neva River, Gulf of Finland, Archangel, oldest port in Russia, mouth of the Dwina on the White Sea, Moscow, the capital on a tributary of the Volga, the central inland city and an industrial center manufacturing cottons, linens, and woolens, Tula, south of Moscow in the coal fields, and Nizhnii Novgarod, in the eastern part of Russia, famous for its yearly fairs.

SAHARA. The great African desert, which extends east and west between the Atlantic Ocean and the Nile, is equal in area to about two thirds of Europe. The west and central parts are mountainous and rocky, while the Libyan desert in the east is composed largely of sandstone. There are many deep valleys, some short streams, and a number of wells in the oases, which constitute about one fortieth of the total area. It is almost devoid of vegetation. Large quantities of dates are raised in the oases, with some wheat, barley, and vegetables. The esparto fiber, dates, and large quantities of salt are exported. It is crossed in all directions, but principally from north to south, by caravan routes, which follow the line of oases, where there are occasionally towns of considerable size. The leading routes center at Timbuktu. A very active trade, by which ivory, ostrich feathers, gums, spices, gold dust, indigo, cotton, and palm oil of the interior lands are exchanged for manufactured goods from European countries, is transacted.

ST. LAWRENCE. One of the great rivers of North America, issuing from Lake Ontario, flows northeast—part of the way forming the boundary between Canada and the United States—and falls into the Gulf of St. Lawrence through a broad mouth. The name is applied to the whole system of the Great Lakes and their connecting streams. It rises as the St. Louis, empties into Lake Superior, whence it finds its way to Lake Huron through St. Mary's river. Lake Michigan enters from the south, and from Lake Huron through St. Clair river, St. Clair lake, and Detroit river, the descent into Lake Erie is slight. Niagara river and falls descend into Lake Ontario, thence to the St. Lawrence proper, with its lake-like expansion, such as Thousand Islands lake, proceeding as a river, then as an estuary into the gulf. The rapids throughout the course have been overcome by a system of canals. The Ottawa and Richelieu are its chief branches. Steamers now convey their cargoes from Liverpool to Duluth without breaking bulk. Duluth, Chicago, Detroit, Buffalo, Hamilton, Toronto, Montreal, and Quebec are great ports along its course.

SAKHALIN or **SAGHALIN.** An island off the eastern coast of Siberia, covering an area of about 29,000 square miles. The surface is largely mountainous and densely wooded. The climate and the soil are not favorable for agriculture; herring fishery is the chief industry. The principal use of the northern part of the island is for a Russian prison settlement and naval base. The southern part of the island, with adjacent islands, was ceded to Japan in 1905.

SALVADOR. The smallest republic of Central America, and the most densely populated. The surface is an elevated table-land between mountain ranges and lofty valleys. The soil is extremely fertile and is well watered. Agriculture is the staple industry. Crops: coffee, sugar, indigo, rice, tobacco, cotton, and some wheat. Minerals: gold, silver, copper, iron, quicksilver, lead, etc. Imports: cotton, drugs, hardware, flour, silk goods, and yarns; exports: coffee, sugar, indigo, balsam, gold, and other minerals. The capital is San Salvador, with ports of Acajutla, La Libertad, and La Union.

SAMOAN ISLANDS. A group of islands in the Pacific Ocean, between Hawaii and New Zealand, formerly known as the Navigator Islands. The Island of Tutuila, and other islands east of longitude 171 degrees west, came into the possession of the United States in 1900. They are all volcanic and mountainous, with luxuriantly fertile coast lands and many mountains well wooded. The soil is well watered and drained. The staple product is copra; fruit is extensively cultivated, the production of cacao is increasing, and other products are taro, breadfruit, yams, cocoanuts, and bananas. The principal export is copra. Pago Pago is a valuable naval and coaling station of the United States. Upolu, Savaii, and the adjacent islands, once German possessions, have been turned over to New Zealand under a mandate of the League of Nations.

SAMOS. An island under the sovereignty of Greece off the west coast of Asia Minor. It is about 30 miles long by 8 miles in width. The surface is well wooded, with a fertile soil to the east and south, rising into mountains on the north. It exports quantities of wine, raisins, leather, oil, cigarettes, carob beans, distilled spirits, grapes, beans, and hides. It is very rich in minerals: marble, zinc, lead, iron ore, emery, lodestone, manganese, antimony, copper, and ocher, but there is little mining. It was here that archæological excavations discovered the celebrated Temple of Hera, one of the largest Greek temples, known to Herodotus.

SAN MARINO. A republic in Italy, 38 square miles in area. It is the oldest state in Europe and one of the smallest states in the world. The surface is hilly, with fertile valleys and slopes on which are multitudinous vineyards. The staple products are cattle, wine, and raisins. Stone is also exported.

SASKATCHEWAN. A province of the Dominion of Canada. The surface is a rolling prairie sloping to the east, broken at intervals by groups of hills. A grand agricultural district, with a very fertile, well-watered soil. Crops: wheat, oats, barley, flax, and hay, all showing phenomenal increases each year. The raising of live stock is extensive. Lakes Winnipeg and Winnipegosis have valuable fisheries. There are good forests of aspen, poplar, pine, and spruce. The enormous beds of coal, with copper, gold, iron, and natural gas are as yet undeveloped. The capital is Regina.

SAXONY. A state in the German republic. The surface is a series of moderate elevations, the highlands in the southeast merging into the plains of the north, and about one half the total area is under cultivation. Along the Bohemian frontier are the Erzgebirge, with the Elster Mountains at the south, and the Lusatian group at the extreme east. The river Elbe enters in the east, where is found the famous "Saxon Switzerland," a region of mountains with wonderfully castellated rock formations, forests of pine, and a narrow, curving river valley of great beauty. The Elbe is the great commercial waterway of the country. About one fifth of the population is engaged in stock raising and agriculture, although about one fourth of the total area is forest land, with almost all of the trees conifers. Crops: rye, oats, potatoes, and hay; small fruit raising is steadily increasing in importance, but sheep raising and the quality of the wool are reported to have declined. For many years Saxony has been a famous manufacturing country, highly developed in the production of textiles, linens, cottons, woolens, silks, worsteds, muslins, hosiery, laces, embroideries, paper of all kinds, damask ticking, clothing, tobacco pipes, watches, cutlery, glass, machinery, pianos, and the celebrated Saxon or Meissen porcelain. Saxony is said to have originated tin plating. Sugar industries are increasing, and also the production of chocolate. Milling and smelting are important industries. It is the center of the transit trade of mid-Germany, and the book trade of Leipzig leads the world. Minerals: silver has been mined since the twelfth century, there is coal (mainly lignite), and iron, lead, tin, marble, and precious stones are all being mined. There are many famous mineral springs. The principal cities are Dresden, the capital, noted for its museums and china; Leipzig and Chemnitz.

SCOTLAND. The northern part of Great Britain. The surface is divided into the north and the central highlands, the lowland central plain, and the hills. There is much magnificent scenery, and the finest grazing lands in the British Isles. Agriculture is confined to the lowlands, the oat crop constituting three fourths of the cereal production, with large crops of hay, turnips, potatoes, and other roots. Scotland has long been famed for its Cheviot sheep, its Ayrshire, Galloway, and Polled Angus cattle, its Clydesdale horses, and Shetland ponies. Over one fourth of the population is engaged in manufacturing cotton, linen, hemp, jute, lace and silk products, liquors, and iron and steel. Scotch woolens and threads are famed all over the world. The Clyde is the largest shipbuilding center in the world. There are valuable fishing interests. Minerals: coal, shale oil, iron ore, granite, fire clay, limestone, slate, and lead ore. The capital is Edinburgh, but the principal city and chief port is Glasgow, an important manufacturing center, with a good harbor.

SEYCHELLES. A group of small islands in the Indian Ocean belonging to Great Britain. They are the summits of a submarine mountain range. The soil is fertile and well cultivated. Exports: cocoanut oil, vanilla, soap, guano, salt fish, tortoise shell, coffee, cloves, pepper, cacao, drugs, and some rubber. The capital is Port Victoria, on Mahe, the largest island.

SHETLAND ISLANDS. A group of about 100 islands off the north of Scotland. The largest is Mainland, the total area being about 550 square miles. The surface is rugged and wild, and the climate moist and variable. There is some little agriculture, but the cultivation is mainly by the spade. Small crops of oats and barley are grown, potatoes, and turnips. Fishing for cod, ling, and herring is the principal industry, and seals and bottle-nosed whales are frequently caught. Great attention is given to the raising of the typical small cattle, sheep, and the world-famous Shetland ponies—a solid colored, shaggy, good-natured, small pony, totally distinct from the smooth, piebald and skewbald Scandinavian ponies which so frequently are miscalled "Shetlands," owing to their being registered with the Shetland blood stock. Imports: oatmeal, flour, tea, tobacco, spirits, sugar, cottons, woolens, timber, tar, and salt; exports: hosiery and shawls (comprising the principal manufactures), cattle, fish, and eggs. The chief town is Lerwick, on Mainland.

SIAM. An independent kingdom of southeastern Asia, in the central part of Indo-China. The surface is mountainous in the north, sloping south and southeast to the gulf, descending in great terraces to Bangkok. The lowlands are fertile, but there is only about one twentieth of the area under cultivation, owing to the extremely high price of labor following the abolition of slavery. Great quantities of rice are grown on the flood plains of the Menam river; pepper, hemp, cotton, tobacco, coffee, fruits, dried fish, cattle, and sesame are other products. Minerals: gold, salt, rubies, sapphires, copper, tin, coal, iron, zinc, manganese, and antimony. Imports: kerosene, machinery, hardware, silk, and apparel; exports: teak and other woods, pepper, salt, hides, soap, and rubber. The capital and chief port is Bangkok.

SIBERIA. An Asiatic possession of Russia embracing more than one-half of the area of the republic. It is divided into Western and Eastern Siberia, and the Amur and Maritime provinces. Western and Eastern Siberia have been in possession of Russia for centuries; the Amur lands, and the southern part of the littoral, were Chinese until 1858, and are still sparsely populated by Russians. Most of the surface slopes gently from south to north, draining to the Arctic Ocean. The coast lands of the Pacific frontage are fringed by mountain ranges covered with forests, producing long stretches of comparatively straight coast line, free from indentation. It has few islands, chief of which are Sakhalin and New Siberia. The Yenisei river divides Siberia into two halves south of the Arctic, the western part is level plains covered in the northwest with the greatest swamp region of the world, embracing the government of Tobolsk and the northern part of Tomsk; the eastern part to the Pacific, and especially in the south, is a land of low plateaus, surmounted by many moderate mountain ranges, which give the country a rugged appearance. In the far north the ranges are absorbed, and the great plains stretch without interruption to Bering Sea. The southern part of the western plains is the agricultural region, and the center of population, although the eastern mountain valleys are well under cultivation; the mountains are rich in minerals. The four great rivers are the Obi, Yenisei, Lena and Amur, which, with their tributaries, give about 30,000 miles of interior navigation. Nine tenths of the population of Western Siberia are employed in agriculture, while mining and hunting are the industries in Eastern Siberia. In the south crops of grains, potatoes, onions, melons, etc., are produced; the southern belt, extending to Lake Baikal, has an extensive area of good farming land with alluvial soil, well adapted for wheat, oats, rye, and barley. The summers in the east are too moist for cereal crops, but fruits and vines flourish. Horse, cattle, and sheep raising is steadily being developed, butter factories have been opened, and it is interesting to note that milk supplied to the factories costs 25 cents for 18 quarts. Manufacturing: leather and tallow, distilling, brick making, ore smelting, and sugar refining, flour milling, carpet weaving, making clothing, porcelain, furniture and utensils. The magnificent river systems

are the principal transportation routes, but the Trans-Siberian railroad is developing agriculture and creating a business of its own. Minerals: gold, silver, coal, iron, lead, copper, tin, graphite, the best graphite mines being controlled by German lead pencil manufacturers. Vladivostok has a magnificent harbor, and is the terminal of the Trans-Siberian railway, which connects it with Petrograd.

SIERRA NEVADA MOUNTAINS. These form, with the Cascade and Coast ranges, the western border of the western highlands in the United States. They are in California, extending 450 miles from northeast to southwest, and contain Mounts Whitney, Shasta, and Tyndall; their sides are covered with forests, and both gold and silver are found.

SOUTH CAROLINA. A South Atlantic state. The surface is a continuous plain rising towards the northwest and merging into the Blue Ridge. It is well watered by the Great Pedee, the Santee, the Savannah rivers and their branches, which furnish considerable water power. More than half the total area is woodland, but agriculture is the chief occupation. Crops: sea island and other staple cotton, tobacco, wheat, maize, oats, and rice. There are active fisheries contributing oysters, whiting, shad, and sea bass. Manufactures: cotton goods, cotton-seed oil and cake, lumber products (turpentine, resin, and timber), distilled spirits, carriages, and tobacco products. Minerals: phosphate rock, clays, granite, some gold, silver, manganese, iron ore, lime, and monazite. The capital is **Columbia**, and the chief port **Charleston.**

SOUTH DAKOTA. A Central state. The surface is a rolling upland plain, in the southwest the "Bad Lands," the west a region of buttes and ridges, and the prominent feature of the state is the famed Black Hills, "the richest hundred square miles on earth," by reason of its minerals. It is watered by the Missouri and numerous tributaries, but irrigation is necessary for the land now under cultivation. Crops: maize, wheat, oats, barley, rye, flax, hay, fruits, and vegetables. There is much live stock raising and poultry farming. Other industries: flour and grist milling, dairying and lumbering. Minerals: gold, silver, copper, lead, stone of various sorts, and clays. The capital is **Pierre.**

SOUTHERN or ANTARCTIC OCEAN. The great belt of water extending round the world, broken only by the southern end of South America, situated about and within the Antarctic circle. The winds sweeping over this area produce the gigantic waves of the "roaring forties." It is also regarded as a "clearing house" of the hydrosphere, where all inequalities and irregularities in the waters of the separate oceans are corrected. Its greatest known depth is 18,000 feet. Table-like icebergs are characteristic of this region. The land is of volcanic origin, and no vegetation or land animals have been observed.

SPAIN. A kingdom occupying about six sevenths of the Iberian Peninsula. The surface is full of contrasts, plateau ranges, extensive river valleys, small rivers, and low plains, which contain some of the most fertile soil in Europe. Most of the rivers are deficient in water, of little value for navigation, and too low for irrigation purposes. The principal rivers are the Tagus, Minho, Douro, Guadiana, Ebro, and Guadalquivir. Agriculture is the main business, nearly the total area being under cultivation by primitive methods. Crops: wheat, barley, rye, grapes, maize, flax, hemp, esparto, oranges, olives, pulse, nuts. There is extensive stock raising in sections, principally merino sheep. The sardine and other fisheries are valuable. Silk is produced. Manufacturing is insignificant, and does not nearly supply the demand, the leading production being iron, cotton goods, tobacco, paper, wines, leather, glass, and olive oil. Spain is exceedingly rich in minerals, and has much iron, coal, zinc, copper, cobalt, lead, quicksilver, salt, sulphur, phosphorus, etc. Imports: provisions, cotton and manufactures, chemicals, drugs, animals and animal products, machinery, stone, minerals, and pottery; exports: provisions, stone, minerals, glassware, pottery, metals, animal products, timber, and cotton manufactures. Wine is frequently one third of the total export. The capital is **Madrid**, and the chief ports are **Barcelona, Bilboa, Cadiz, Santander, Alicante, Malaga**, and **Valencia.** Included in the kingdom are the **Balearic Isles** off the coast, exporting vine products, olives and fruits, and the **Canary Islands**, near Africa, exporting tomatoes, bananas, cochineal insects (used in dyeing), and potatoes. The colonies are confined to the north and west of Africa: **Rio de Oro Colony** and **Adrar**, the **Rio Muni** and **Cape San Juan**, and **Fernando Po, Annobon, Corisco, Elobey Chico**, and **Elobey Grande.** They have a low coast but contain vast forests. They have no harbors.

STRAITS SETTLEMENTS. A crown colony of Great Britain, consisting of some British possessions on the Malayan Peninsula, and the adjacent islands of Singapore, including **Labuan**, the **Malaccas, Dindings, Penang**, the **Province of Wellesley**, the **Cocos or Keeling Islands**, and **Christmas Island**—the "key to the Chinese Sea." The products are cocoanuts, rice, sugar, coffee, tapioca, sago, pepper, gambier, and nipa palms. Valuable forests produce much fine timber, oils, resins, and rattans. Minerals: tin, gold, lead, iron, bismuth, quicksilver, arsenic, manganese, plumbago, silver, and zinc. Imports: rice, cotton goods, coal, machinery, petroleum, opium, and sugar; exports: padi, nearly half the tin used in the world, sugar, tapioca, gambier, coffee, rubber, copra, spices, gums, and gutta-percha.

SUDAN. The great region between the Atlantic and the Red Sea in northern Africa, and between the Sahara on the north, and the Gulf of Guinea, the Nile, and the Congo rivers on the south. It has been known as "the Black Zone," most of the territory being under the control of Great Britain, Egypt, and France. Agriculture and cattle raising are the chief occupations. Imports: clothing, coal, machinery, and railway materials; exports: gum, ivory, ostrich feathers, cereals, cotton, dates. One of the great trade centers is **Timbuktu**, on the southern edge of the Sahara, whence radiate five important caravan routes. The capital is **Khartoum.**

SWEDEN. The eastern and larger part of the Scandinavian peninsula. The surface is mountainous along the western frontier, with a plateau sloping to the Baltic Sea in three terraces. The northern end of the first terrace has forests which cover nearly one half of the total area of the land; in the second is the rich mineral belt; and the lower terrace is the fertile farm section. The country is well watered, and rich in lakes. The largest river is the **Klar Elf.** Although only a very small part of the total area is under cultivation, nearly three fourths of the population are agriculturists. Crops: oats, rye, barley, wheat, pulse, great quantities of potatoes, some sugar beets, flax, and tobacco. There is considerable cattle and sheep raising; timber and wood working is of great importance, also the manufacture of wood pulp, iron products, flour, and sugar. Minerals: large and famous "Swedish" iron deposits, silver, lead copper, zinc, manganese, sulphur pyrites, and some coal. Imports: minerals, metal goods, machinery, textiles colonial wares, maize, and flour; exports: timber products, live animals, dairy products, metal works, machinery, and paper products. The capital and one of the chief ports is **Stockholm**, and other ports are **Goteberg, Malmo**, and **Helsingborg.**

SWITZERLAND. A republic known as "the playground of Europe." About two thirds of the surface is lofty mountains forming the watershed of Europe. The deep valleys are extremely fertile. It contains the headwaters of the Rhine, Rhone, Po, and Danube, which are almost useless for navigation, but have great water power value. Agriculture is pursued. Crops: hay, rye, barley, fruits, and vegetables. Manufactures: furniture, watches, metal and textile products, lace, ribbons, cheese, condensed milk, and wine. Minerals are of little importance except salt and cement. Imports: textiles, cereals, minerals, iron products, colonial produce, and machinery; exports: silk, cotton, woolen goods, dairy products, machinery, watches, chemicals, food products, and hides. The capital is **Berne**, and chief cities are **Zurich**, the railroad center, **Basel**, noted for ribbons, and **Geneva**, for watches.

SYRIA. A tableland bordering on the Mediterranean Sea and sloping eastward to the Arabian desert. The country is governed by two mandates, the north under the French and the south under the English. The soil along the coast is very fertile but as we go toward the interior the fertility declines, due to less moisture and lack of irrigation. Not more than 10% of the land is used. The crops are, near the coast, olives, lemons, grapes, and oranges, further inland, cereal crops, wheat, tobacco, hemp, sugar cane and silk. The mineral products are iron, lead, phosphate, copper, antimony, and building stones. Manufacturing is simple rather than complex, flour, oil, soap and silk thread. The cities are **Beirut**, the capital, **Aleppo** and the ports of **Tyre** and **Sidon.**

TAHITI. The largest of the Society Islands. It consists of two unequal, nearly circular portions of land connected by an isthmus of volcanic origin, the surface rising in concentric terraces to a final height of 7,668 feet. The rainfall is abundant, and the island is very fertile, but agriculture is conducted under the most primitive methods. The chief town is **Papeiti**, the capital of the French establishments in the eastern Pacific, with a cathedral, arsenal, hospital, etc.

TENNESSEE. A Southern state. The surface falls into marked regions of plateaus, slopes, valleys, and plains. It is well watered by the Mississippi, Tennessee, and Cumberland rivers, all navigable. The soil is much diversified, and is of great fertility. Crops: maize, wheat, oats, cotton, hay, tobacco, potatoes, peas, sorghum, peanuts, and small fruits. There is considerable stock raising; lumbering is extensive in the large forest areas of pine, hemlock, maple, ash, red and swamp cedar, cypress, larch and papaw. Manufactures: flour and grist, iron and steel products, cottonseed oil and cake, leather, textiles, and tobacco products. Minerals: coal, iron (one half being brown hematite), copper, zinc, barytes, phosphate rock, sandstone, limestone, marble, and clays. The capital is Nashville, with leading cities of Memphis and Chattanooga.

TEXAS. A Southern state and the largest of the American Union. From the coast the surface rises gradually by terraced slopes to the Plateau Region, a rugged mountainous region with arid valleys lying southwest of the Pecos river, which are perfectly adapted for grazing. Agriculture is confined mainly to the eastern and central parts. Crops: cotton, oats, wheat, maize, rice, tobacco, cane sugar, sorghum, vegetables, and fruit. It has the largest live stock interests in the United States. There are valuable forest areas of yellow pine and oak, cottonwood, ash, gum, etc. Manufactures: flour and grist, cottonseed oil and cake, lumber and meat products, railroad cars, and petroleum. Minerals: petroleum, coal, clays, iron ore, natural gas, salt, gypsum, cement, granite, sandstone, limestone, some gold, silver, asphalt, etc. The capital is Austin, with chief cities of San Antonio, Houston, Dallas, and the great seaport of Galveston.

TIAN-SHAN MOUNTAINS. These "Celestial Mountains" of several parallel ranges extending from Pamir into Turkestan form the boundary between Russian and Chinese territory in Asia. They are very high and noted for the abundance of snow and glaciers. The southern slopes are treeless, the northern are covered with pines.

TIERRA DEL FUEGO. An archipelago off the extreme end of South America, consisting of the large main island of King Charles South Land and the islands adjacent. The total area is about 27,000 square miles, of which the main island occupies more than four fifths. The Andean Mountain system extends through them. In the east is good soil and pasture land, with extensive forests of beech and pine along the mountain base. There is considerable sheep farming.

TONGA or FRIENDLY ISLANDS. A Polynesian group in the Pacific Ocean, a native kingdom controlled by Great Britain. The area is small, and only about one fifth of the islands are of any importance. The most fertile island is Tonga-tabu, which has about one half of the total population of the group. The rainfall is heavy, and the land area covered with luxuriant vegetation. The land is leased not sold, and, as its tenure is not assured for any length of time, few improvements are made. Imports: foodstuffs, cotton goods, and draperies; exports: copra, fungi, and native mats and tapa.

TURKEY. Once a great European power, driven practically out of Europe by the treaty of Versailles and then back again under the treaty of Lausaune, the country now comprises eastern Thrace and Adrianople, Constantinople, all of Asia Minor and the islands of Imbros, Tenedos and Rablut. The entire country is poor and very backward, both agriculturally and industrially, especially in Anatolia, the seat of the government. The major portions of this area is a plateau region surrounded on three sides by mountains and the fourth slopes down to the Mediterranean coast. Nuts and almonds, olives, dried fruits, silk, tobacco, cereals, figs, opium, wheat, skins, and hides, linseed and licorice form the main bulk of the agriculture products. The minerals are many but have been little worked and in many cases not even the amounts are known or estimated. They include chrome ore, silver, antimony, copper, lead, zinc, lignite and asphalt. Woolens, cottons and carpets, are the main manufactured products. The exports are nuts, carpets, opium, woolens and tobacco. Constantinople is the chief city and historically famous as the meeting place of the East and the West. It is the key city to the Near East. Angoria in Anatolia is the capital.

UKRAINE. A republic, east of Poland and north of the Black Sea with an estimated area of 20,000 square miles. It was recognized as a republic in 1921 but in reality the state is under the influence of the Soviet government. It is a part of the great Central Plain of Europe having continental climate, moderate rainfall, and very fertile soil. 65% of the land is arable and was the agricultural and economic heart of Russia. The crops are wheat (the second largest producing area in the world), barley, rye, sugar beets, and tobacco. The mineral products are coal and iron, iron particularly in the Don and the Donetz basins. The cities are, Kiev on the Dnieper river, an industrial and commercial center, particularly in the refining of sugar, and Odessa, the chief seaport on the Black Sea, one of the greatest grain shipping ports in the world.

UNGAVA. A district of the Dominion of Canada, lying north of Quebec and west of Labrador. It is the fourth largest in area, but is undeveloped, and was unexplored until 1892–4. There are large forests of spruce and birch in the south, extending in the valleys to the fifty-seventh parallel, north of which are no trees, although there is a scrub area producing gooseberries, cranberries, currants, and huckleberries. It is known there is a large area of iron ore, and there are also indications of gold, copper, and nickel.

UNITED STATES. The vast area in the central part of North America lying between Canada on the north, the Gulf of Mexico on the south, and stretching from the Atlantic to the Pacific Ocean, the richest and most populous section. It is composed of 48 states united in one great federal nation, with territories and island dependencies, besides the District of Columbia. Compared with Europe the coast of the United States has very few projections or indentations, but, though few in number, they are of special commercial importance. **Long Island** is the largest island. Two great mountain systems, one on each border, form the framework of the physical structure, which may be divided into four distinct sections. Beginning at the east are the coastal plains and plateaus between the Atlantic Ocean and the Appalachian Mountains. Narrow in Maine they grow gradually wider towards the south. In New England they form a rough lowland; in the middle higher, but very productive; from New York to Florida they slope gently to the sea with a sandy soil and many large swamps. The next section includes the Atlantic Highlands or **Appalachian Mountain** system. Between this and the western mountain system and extending from the Gulf of Mexico to Canada is the Great Central Valley or Plain. It rises gradually from the gulf towards the north, east, and west, its evenness broken only by the Ozark Mountains. This great valley occupies about one half the entire area of the United States, and its fertility makes it the most important agricultural basin in the world. The western system of mountains is a great plateau with the **Rocky Mountains** on the eastern border, **Cascade, Sierra Nevada,** and **Coast Ranges** on the western, between which is a series of broad valleys, inclosing the Great Basin, much of which is occupied by the American desert. Besides the Great Lakes on the border there are thousands of smaller ones in New England, Minnesota, and the Western states. The drainage areas are classified as the St. Lawrence, Atlantic, Mississippi or Gulf, and the Pacific. With its great extent and varied topography the United States has every variety of climate characteristic of the temperate zone. Its rainfall varies greatly. The eastern part is well wooded and great forests occur along the western and northern borders, following closely the distribution of rain. Industries: manufacturing, agriculture, including stock raising and dairying, mining, lumbering, fishing and shipbuilding. The principal products are cereals, cotton, minerals, textiles, tobacco, cattle, timber, oil, and fish. Imports: silk and its manufactures, sugar, hides and skins, chemicals and drugs, coffee, cotton goods, fiber, rubber and gutta-percha, wool and its manufactures, iron and steel and their manufactures; exports: raw cotton, meat and dairy products, breadstuffs, iron and steel and their manufactures, mineral oils, copper and its manufactures, wood and its manufactures, animals, leather, and tobacco with its manufactures. The United States ranks first in the value of domestic commerce, but second in foreign commerce. **Washington** is the capital, **New York, Boston, Philadelphia, Detroit, Cleveland, Baltimore, Chicago, Pittsburgh, New Orleans, Galveston,** and **San Francisco** are the great commercial centers. Island dependencies: **Guam,** the largest of the Ladrones, a naval station, the **Hawaiian** group, **Philippine Islands,** and **Tutuila** with others of the Samoan group are in the Pacific Ocean; **Porto Rico** in the West Indies. **Alaska** in the extreme northwest, is the largest territory.

URAL MOUNTAINS. They separate the lowlands of European Russian from those of Siberia, and consist of several parallel ranges 2,000 miles long, running southwest to northeast, the highest summits reaching 5,000 feet. They are extremely rich in all kinds of minerals, especially gold, platinum (90 per cent. of the world's supply), iridium, osmium, and other rare metals; also iron, cobalt, copper, quicksilver, nickel, and zinc; much the greater part of the iron ore of Russia is obtained in the Ural mountains. The coal beds are little mined.

Precious stones are abundant, those for which this region is famous being the emerald and topaz from the mines of Murzinsk, the diamond, malachite, azurite, and jaspar. Many towns have sprung up in consequence of the mineral wealth. These mountains form a watershed for the rivers of Russia; immense forests of conifers, birch, and beech grow in the center and south. Telpös-is (5,526 ft.) is the highest summit.

URUGUAY. The smallest South American republic. Much of the surface is rolling, grass-covered plains, well watered by the Rio Negro, the Uruguay, the Rio de la Plata, and a plentiful rainfall. Agriculture and stock raising are leading occupations. Crops: wheat, flaxseed, oats, barley, birdseed, and tobacco. There are immense numbers of sheep, and a heavy wool clip is obtained; many horses, cattle, swine, mules, and goats are raised. Other industries: flour and grist milling, slaughtering, packing, and extracting of beef. Gold is worked, and there are also silver, copper, lead, magnesium, and lignite. Imports: raw and manufactured materials, soft goods, foodstuffs, and beverages; exports: animal products, live stock, wool, minerals, and agricultural produce. The capital is **Montevideo**, with ports of **Colonia, Maldonado, and Minas.**

UTAH. A Western state whose surface in the west is a vast, dry basin; in the east, irrigation has made the plateau of corresponding altitude a garden of fertility. Eastern Utah is drained by the Colorado and Green rivers. Agriculture is the staple industry, but it is only possible under irrigation. Crops: wheat, oats, hay, maize, barley, rye, sugar beets, vegetables, and fruits. There are large numbers of sheep and other farm animals, and dairying is being rapidly developed. Manufacturing industries: smelting and refining copper, flour and grist milling, making and repairing cars, butter and cheese making, salt evaporating, and fruit canning. There are valuable deposits of gold, silver, copper, coal, manganese ores, gypsum, petroleum, sulphur, quicksilver, and salt. The capital is **Salt Lake City. Ogden**, is the second largest city in the agricultural district. Meat packing, fruit and vegetable canning are the chief industries.

VENEZUELA. A republic in the northern part of South America. Its surface is divided into three sections: the north and northwestern are mountainous districts, where agriculture is chiefly pursued; the valuable grazing lands between the mountains and the Orinoco, and the section of forest lands containing many important woods, medicinal plants, gums, etc. Crops: sugar cane, coffee, cereals, caoutchouc, tonga beans, copaiba, cacao, and vanilla. The farming methods are primitive and wasteful, but stock raising of oxen, goats, asses, horses, swine, sheep, and mules is very extensive. There are no important manufactures. There is abundant gold, silver, copper, salt, and iron, with some sulphur, coal, asphalt, lead, kaolin, and tin. Imports: cotton goods, wheat flour, lard, rice, and butter; exports: coffee, cacao, cattle, hides, dividivi, fustic, rubber, and gold. The capital is **Caracas**, chief ports **La Guaira and Maracaibo.**

VERMONT. A New England state. The Green Mountains practically cover the surface of the state. The land suitable for cultivation is in the valleys and western lowlands. The hills, slopes, and summits of the mountains are covered with rich herbage. Crops: hay, oats, maize, potatoes, wheat, barley, tobacco, and fruits, especially fine apples. The live stock interests are large in milch cows and other cattle, sheep, swine, and horses. There are valuable forests. Manufactures: lumber and timber products (including pulp), flour and grist, foundry and machine shop products, cheese, butter, maple syrup and sugar, and woolens. More marble is quarried than in any other state; granite, slate, and talc, with other minerals, and found in small quantities. The capital is **Montpelier**, with leading cities of **Burlington and Rutland.**

VIRGINIA. A middle Atlantic state. The surface is divided into the coastal plain, the Piedmont plain, and the Appalachian Mountain region. The state is well watered by the James, Potomac, Rappahannock, and other rivers. Agriculture is an important industry. Crops: maize, wheat, oats, potatoes, hay, cotton, tobacco, peanuts, and small fruits. There are important stock raising interests in cattle, swine, sheep, horses, and mules. The oyster and other fisheries are important. There is much good forest area. Manufactures: tobacco, cigars, cottons, iron products, paper, railway cars, leather, etc. Minerals: coal, granite, limestone, iron, manganese, talc, soapstone, titanium, etc. The capital is **Richmond**, with **Norfolk, Petersburg, and Newport News** as leading cities.

VOLGA RIVER. Largest river of Russia as well as of Europe, being 2,293 miles from its source in Valdi Hills to its 70 mouths in Caspian Sea. It has two large tributaries, one each from the east and west. The whole system waters 22 Russian provinces with a total navigable length of 9,000 miles. Traffic ceases for three months in the winter, but it is enormous. Timber, grain, salt, and naphtha are the principal articles carried. The fisheries (sturgeon, carp, and pike) are of great importance. Chief ports are **Astrakhan and Nizhni Novgorod**, the latter noted for its great annual fairs. Canals connect this river with the White, Black, and Baltic seas.

WALES. A historic division of the United Kingdom projecting westward from Great Britain. It is a mountainous country of wonderful beauty. Its highlands are unavailable for agriculture, and are not good grazing land. It is well watered by tributaries of the Severn, and by the Dee, Wye, Usk, and many other small streams. Crops: barley, oats, rye, vegetables and hay. There are great flocks of the famed Welsh sheep, and other farm animals. About one fifth of the coal of the United Kingdom is mined in Wales. **Cardiff** is a great coal shipping port of the world. Other minerals are iron, tin, lead, zinc, copper, and some gold.

WASHINGTON. A Western state, divided by the Cascade Mountains into a smaller western and a larger eastern section. About one fifth of the total area is under cultivation, and the irrigated area is constantly being increased. The Columbia river drains the eastern part of the state, and the west is drained by small streams. Crops: wheat, oats, barley, hay, and fruits. It is a great sheep grazing country. There are valuable forests of fir, cedar, spruce, and hard woods. Fisheries are important, salmon and marine fish being taken in large quantities. Other industries: lumbering, flour and grist milling, canning fruits, slaughtering and packing. The coal and clay deposits are valuable; gold, copper, granite, sandstone, limestone, iron ore, lead, zinc, antimony, arsenic, are mined in small quantities. The capital is **Olympia; Seattle and Tacoma** are the largest cities.

WEST INDIES. A large archipelago in the Atlantic Ocean between the North and South American continents. The British possessions are by far the most important, and comprise the **Bahamas**, capital **Nassau**, exporting fresh and canned fruits, lumber, pearl, and shell; **Barbados**, capital **Bridgetown**, exporting sugar and cotton; **Jamaica** (including **Turks, Caicas, and Cayman Islands**), capital **Kingston**, exporting sugar, coffee, bananas, rum, turtles, cocoanuts, maize, and cacao; the **Leeward Islands** (including **Antigua, St. Kitts, Dominica, Montserrat**, and the **Virgin Islands**), exporting sugar, cotton, cattle, pineapples, coffee, lime juice, and arrowroot; **Trinidad**, capital **Port of Spain** (including **Tobago**), exporting sugar, cacao, coffee, cocoanuts, asphalt, and rubber; the **Windward Islands** (including **Grenada, St. Vincent, Grenadines**, and **St. Lucia**), exporting sugar, cacao, rum, cotton, coffee, fruit, nutmegs, and spices. The islands are purely agricultural. **Haiti** is a republic, exporting logwood, coffee, cacao, cottonseed, cotton, hides, hemp, various woods, shell, and some minerals. **Cuba** is a republic. **Porto Rico** is owned by the United States. The French, Danish, and Netherlands possessions are included under those countries.

WEST VIRGINIA. A Middle Atlantic state. The surface is uneven, and in the east and south is mountainous. West of the mountains is a belt of flat hills, grading into a rolling country that slopes to the Ohio river. It is well drained by tributaries of the Ohio, and by the Potomac, Monongahela, and the Kanawhas. There are extensive forests of chestnut, oak, hickory; locust, maple, tulip, birch, spruce, pine, and hemlock. Crops: maize, wheat, oats, tobacco, hay, buckwheat, potatoes, and fruits. It is a great sheep and milch cow grazing country. Manufactures: lumber, iron, steel, foundry and machine shop, leather and clay products, coke, glass, flour and grist. Minerals: coal, petroleum, natural gas, iron, sandstone, limestone, salt, and clays. The capital is **Charleston**, the largest city is **Huntington.**

WHITE SEA. A branch of the Arctic Ocean penetrating 350 miles into northern Russia. It consists of an inner and an outer portion joined by a narrow strait. It receives the Dwina and Onega rivers, besides many lakes. It is icebound from September to June, nevertheless with the canals direct communication is made through the Dneiper and Volga rivers with the Caspian and Black seas, so that the volume of trade is considerable. **Archangel** is the chief port.

WISCONSIN. A Central state, a part of the lake plain of the northwest. It is well drained, and most of the land is fertile. Agriculture and dairying are very extensive. Crops: maize, oats, barley, wheat, hay, potatoes, sugar beets, and tobacco. The orchard area is steadily

increasing. There are large herds of milch cows and other cattle, horses, sheep, and swine. The forests are valuable, and great quantities of white pine, hemlock, and spruce are marketed. Manufactures: lumber products, cheese, butter, condensed milk, foundry and machinery products, flour and grist. Minerals: iron ore, lead, granite, limestone, sandstone, natural rock cement, graphite, petroleum, also mineral waters. The capital is Madison, and the principal city is Milwaukee.

WYOMING. A Western state. The surface is a lofty plateau. The soil is arid and irrigation is used wherever agriculture is practiced. There are great grazing areas suitable for stock raising, and the state is second to Montana in the production of wool. Crops: hay and forage, with some wheat, oats, and small quantities of other cereals, and roots. Manufacturing industries are limited mainly to products for local consumption. Transportation facilities are very poor. The rich iron ore and petroleum resources constitute a good basis for development. Minerals: coal, iron, copper, limestone, gypsum, some gold and silver. The capital is Cheyenne.

YANGTZE RIVER. The longest and most important river of China. Its source is a number of tiny streams far above sea level. It is known by different names in varying sections, drains whole provinces, and receives the waters of many important streams. It pours into the yellow sea an immense volume of water, depositing annually an enormous amount of sediment. It is navigable for ocean steamers 600 miles, and 500 miles farther for light-draught steamboats. Its importance to China's commerce is vast.

YENISEI RIVER. Longest river in Asia and fourth longest in the world. It rises in the mountains of northern Mongolia and flows 3,250 miles across the center of Siberia into the Arctic Ocean. With the Obi and Lena rivers it flows in parallel courses and through its tributaries is so closely connected with them that a continuous waterway through Siberia is formed; goods are sent from the Caspian Sea by the Ural river into a branch of the Obi, then up the Obi to the Yenisei and the Lena, a distance of 6,000 miles, the journey being broken by only two short portages. The middle course of the river runs through forests of pine, birch, and larch. Three months of the year it is frozen in the south, but in the north it is icebound all but six weeks.

YUKON. A northwestern territory of the Dominion of Canada, bounded on the extreme north by the Arctic Ocean. Very little was known of the surface until the close of the nineteenth century, when it was found to be a succession of rolling hills and mountain ranges penetrated by large rivers, the navigable head streams and branches extending in every direction. It is one of the coldest districts in the world. The agricultural possibilities are limited, although rye, barley, potatoes, cabbage, peas, lettuce, and roots have been raised during the brief summer. It contains some of the richest gold deposits; beds of lignite coal are known to exist, but have not been thoroughly surveyed.

YUKON RIVER. One of the largest rivers of North America, and in the extreme northwestern part extending through Alaska. It is formed at Fort Selkirk by the junction of the Lewes and Pelly rivers, emptying into Bering Sea through a large delta. Throughout its total length, including the Lewes, it is navigable at least for small boats. The delta is very broad, and the discharge of water is estimated at two thirds the volume of the Mississippi. During three months its waters swarm with salmon.

ACREAGE, PRODUCTION, AND VALUE OF THE CROPS OF THE UNITED STATES

Name of State. Date of Admission. Area and Population.	First Settlement. By Whom. Date.	How Acquired.	Origin and Meaning of Name.	Motto and Meaning. Emblem. State Flower.
Alabama (1819). 51,998 sq. miles. 2,832,961 pop.	Fort St. Louis by French in 1702.	Part of Mississippi territory.	Indian, meaning here we rest.	Here we rest. Goldenrod.
Alaska (ter.) (1868). 586,400 sq. miles. 72,524 pop.	Three Saints by Russians in 1784.	Purchased from Russia in 1867.	*Al-ay-es-ka,* meaning the great country.	Forget-me-not.
Arizona (1912). 113,956 sq. miles. 499,261 pop.	Tucson by Spaniards about 1580.	Part of Mexican Cession and Gadsden Purchase.	Indian, meaning sand hills.	*Ditat deus:* God enriches. Sahuaro Cactus.
Arkansas (1836). 53,335 sq. miles. 1,949,387 pop.	Arkansas Post by French in 1685.	Part of Louisiana territory.	From a tribe of Indians. French and Indian word, meaning bow of smoky waters.	*Regnant populi:* The people rule. Apple blossom.
California (1850). 158,297 sq. miles. 6,907,387 pop.	San Diego by Spanish in 1769.	Part of Mexican Cession.	Spanish, meaning hot furnace.	*Eureka:* I have found it. Golden poppy.
Colorado (1876). 103,948 sq. miles. 1,123,296 pop.	Auraria by Americans in 1859.	Part of Louisiana Purchase and Mexican Cession.	Spanish, meaning colored red.	*Nil sine numine:* Nothing without God. Columbine.
Connecticut (1788). 4,965 sq. miles. 1,709,242 pop.	Windsor by the English in 1635.	Part of New England; one of the 13 original states.	Indian, meaning long river.	*Qui transtulit sustinet:* He who transplanted still sustains. Mountain laurel.
Delaware (1787). 2,370 sq. miles. 266,505 pop.	Near Wilmington by the Swedes in 1638.	One of the 13 original states.	Named in honor of Lord Delaware.	Liberty and independence. Peach blossom.
District of Col. (1791). 70 sq. miles. 663,091 pop.	Rome by English in 1663.	Territory ceded to government by Maryland and Virginia.		*Justitia omnibus:* Justice to all. American beauty rose.
Florida (1845). 58,666 sq. miles. 1,897,414 pop.	St. Augustine by Spanish in 1565.	Purchased from Spain in 1821.	Spanish, meaning blooming.	In God we trust. Orange blossom.
Georgia (1788). 59,265 sq. miles. 3,123,723 pop.	Savannah by English in 1733.	One of the 13 original states.	Named in honor of George II.	Wisdom, justice, moderation. Cherokee rose.
Hawaii (ter.) (1900). 6,407 sq. miles. 423,330 pop.	Spanish sailors, 1527.	By annexation.	Hawaii, meaning big island.	
Idaho (1890). 83,888 sq. miles. 524,873 pop.	Cœur d'Alene by Americans in 1842.	Part of Oregon territory.	Indian, meaning gem of the mountains.	*Esto perpetua:* May it last forever. Syringa.
Illinois (1818). 56,665 sq. miles. 7,897,241 pop.	Kaskaskia by French about 1720.	Part of Northwest territory.	Indian, meaning the men.	State sovereignty—national union. Wood violet.
Indiana (1816). 36,354 sq. miles. 3,427,796 pop.	Fort Vincennes by French about 1730.	Part of Northwest territory.	Means Indians' ground.	No motto. Tulip tree blossom.
Iowa (1846). 56,147 sq. miles. 2,538,268 pop.	Fort Dubuque by Americans in 1833.	Part of Louisiana Purchase.	Indian, meaning beautiful land.	Our liberties we prize and our rights we will maintain. Wild rose.
Kansas (1861). 82,158 sq. miles. 1,801,028 pop.	Fort Leavenworth by Americans about 1827.	Part of Louisiana Purchase.	Indian, meaning smoky water.	*Ad astra per aspera:* To the stars through difficulties. Sunflower.
Kentucky (1792). 40,598 sq. miles. 2,845,627 pop.	Harrodsburg by Americans in 1774.	Part of Virginia.	Indian, meaning dark and bloody ground.	United we stand, divided we fall. Goldenrod.
Louisiana (1812). 48,506 sq. miles. 2,363,880 pop.	Iberville by French in 1699.	Part of Louisiana Purchase.	Named in honor of Louis XIV.	Union, justice and confidence. Magnolia.
Maine (1820). 33,040 sq. miles. 847,226 pop.	Pemaquid by English in 1625.	Part of Massachusetts; one of the 13 original states.	Called the Mayne land in a charter from Charles I, 1639.	*Dirigo:* I direct. Pine cone and tassel.
Maryland (1788). 12,327 sq. miles. 1,821,244 pop.	St. Mary's by the English in 1634.	One of the original states.	Named in honor of Queen Henrietta Maria.	*Fatti maschii parole femine:* Manly deeds and womanly words. Blackeyed Susan.
Massachusetts (1788). 8,266 sq. miles. 4,316,721 pop.	Plymouth by English in 1620.	Massachusetts Bay Colony; one of the 13 original states	Indian, meaning the land of great hills.	*Ense petit placidam sub libertate quietem:* With the sword she seeks quiet peace under liberty. Mayflower (trailing arbutus).
Michigan (1837). 57,980 sq. miles. 5,256,106 pop.	Sault Sainte Marie by French in 1668.	Part of Northwest territory.	Indian, meaning great lake.	*Si quaeris peninsulam amoenam circumspice:* If thou seekest a beautiful peninsula, behold it here Apple blossom.
Minnesota (1858). 84,682 sq. miles. 2,792,300 pop.	At mouth of St. Croix and Minnesota rivers by Americans in 1805.	Part of Louisiana Purchase and Northwest territory.	Indian, meaning sky-tinted water.	*L'étoile du nord:* The star of the north. Moccasin flower.
Mississippi (1817). 46,865 sq. miles. 2,183,796 pop.	Biloxi by French in 1699.	Part of Louisiana and Georgia.	Indian, meaning great river, or father of waters.	*Virtute et armis:* By valor and arms. Magnolia.
Missouri (1821). 69,420 sq. miles. 3,784,664 pop.	Sainte Genevieve by French about 1735.	Part of Louisiana Purchase	Indian, meaning muddy.	*Salus populi suprema lex esto:* Welfare of people is the supreme law. Hawthorn.

Wheat, sheep, wool, dairy products, coffee, bananas, fruits, cattle, swine, horses, sugar, vineyards, hay, corn.	Gold, coal, iron, copper, silver, antimony.	Meat packing and products, hides, tallow, leather products, chemicals, boots, shoes, iron, steel, dairy products.
Wheat, fruits, oats, hay, wool.	Copper, gold, silver, lead, tin.	
Timber, cattle, sheep, cereals.	Coal, silver, gold, tungsten.	Lumber, meat and dairy products, shoes.
Sheep, wool, cattle.	Unexplored mineral wealth.	.....
Coffee, coconuts, cacao, fruits, sugar, rubber.	Gold, silver, copper.	Mats, nets, pottery.
Rice, rubber, sisal, bananas.	.....	Sugar, lumber, sisal fibre.
Pineapple, copra, rubber, sugar.	.....	Food products.

FIFTEEN LARGEST CITIES OF THE UNITED STATES

NEW YORK CITY.

New York City, located on the banks of the Hudson river on New York bay is probably the mecca of more people in the United States than any one other place on the globe. Here, we find the largest population—7,454,995—of any city in the country; a great polyglot people, 40% foreign born from sixty different nations; the greatest skyscrapers of iron, brick and cement in the world; the richest financial center in the United States, ranking with London; a great commercial city controlling roughly 40% of the imports and exports of the country; a workshop that produces goods equal to one-third of all goods of our land; and a great social, civic and art center.

The city is located at the mouth of the Hudson river. This being a sunken river, gives it one of the best harbors in the world. The city, which was once concentrated on the small tip of Manhattan Island, the point of land between the Hudson river and the East river has now spread up the mainland to West Chester and Yonkers, the Bronx and especially over to Brooklyn which has been one of the areas for taking care of New York's fast growing population. In 1898, the city was reorganized and the following five boroughs were created:

Manhattan Island, lying between the Hudson, Harlem and East rivers, which includes the heart of the business, financial and social section of the city, together with Blackwells, Randalls, Wards, Governors, Beddoes and Ellis islands.

Bronx on the mainland of Manhattan, extending to Mt. Vernon and New Rochelle, including the islands of Brothers, North and South Rickers, Hunters City and Harts.

Brooklyn, the third city in population in the U. S., is on the southwest extremity of Long Island.

Queens running from Brooklyn north and northeast, embraces the smaller municipalities of Long Island City, Newton, College Point, Corona, Whitestone, Flushing, Jamaica, and Far Rockway.

Richmond is composed of Staten Island, Shouter Island, Poalls Island and Meadow Island.

The first white man ever known to have touched this area was Giovanni da Verrazano, an Italian, in 1524. In 1609, Henry Hudson, an Englishman in the service of the Dutch East India Company, sailed to this country in the search for a shorter passage to India and because of icebergs to the north, he pressed South, and in September of that year his ship, the Half Moon, sailed up the river that now bears his name. Because of the possibilities for fur trading, companies were formed and sent over to this country, one of the first under the leadership of Adrian Block. In 1623, thirty families settled on the island of Manhattan, which they had bought from the Indians for $24 in beads, cloth and trinkets. In the meantime, the English were claiming this area because of the explorations of John Cabot, and in 1664 in the reign of Charles II, a force was sent over that took the town and fort, ran up the English flag and called it New York, after the king's brother, James the Duke of York, to whom the land had been granted.

In 1665, the city government was organized and by 1746 the population numbered 12,000. The early growth of New York City was slow, in contrast to such cities as Philadelphia and Baltimore, which were surrounded by land better adapted to agriculture. In 1825, however, the Erie Canal was completed, connecting the Great Lakes with the Atlantic Ocean by the way of the Mohawk and Hudson rivers. The raw products of the West came East to be exchanged for manufactured products and food. New York City became the trading counter and re-shipping port, thus laying the foundation for the present commercial supremacy of the city.

The city is the banking center of the United States and ranks with London as a money market. It is the central stock and bond exchange of our country. In the city are the great banking houses of Morgan, the National City Bank, Guaranty Trust, and a host of others—the figures being 44 national, 48 state, 54 savings and 35 trust banks, these numbers not including branches.

The harbor facilities include 578 miles of water frontage and excellent dock facilities. Figures show a yearly total of 74,182 ships entering the harbor with 99 ocean steamship lines having headquarters in the metropolis. In 1924 the foreign trade figures of the city were $1,657,685,331 for exports and imports to the value of $1,689,998,112, which compares favorably with the figures for the entire country, exports $4,590,981,958 and imports $3,610,552,566. The principal products shipped are: iron and steel products, copper, meat, bread stuffs and mineral oils.

As well as being a commercial city, New York is a great manufacturing city, for it fabricates more goods than any other city in the United States. The goods produced are not so much for world consumption as to feed the needs of the great metropolis. The clothing industry is one of the exceptions to this rule, one-half of the clothing worn by the people of the United States is made on the island of Manhattan and neighboring boroughs. In 1921, the figures were $326,837,298, for men's cloth, and the value on women's was $759,627,929. There are in the city 26,801 establishments turning out products valued at $4,328,187,499. Other important industries with their values are: printing and publishing—$252,475,386; bread and bakery products—$166,147,715; millinery—$163,481,725; tobacco and cigarettes—$147,498,906; slaughtery and meat packing—$132,264,732; fur goods—$100,217,230; and boots and shoes—$68,283,896. Other industries are sugar refining, preparation of coffee and spices, oil refining, drugs and chemicals, etc.—all the industries that make for the well being of a large city.

The problem of transportation is a very serious one due to the congestion on Manhattan island, where the business district is, and due also to the fact that it is a narrow island. Four bridges connect Long Island with the city proper,

as well as three pairs of tunnels. The bridges are Brooklyn Bridge, 6,016 feet long, Manhattan Bridge, 6,855 feet, Williamsburgh Bridge, 7,308 feet and Queensborough Bridge, 7,499 feet. The other bridge is the Hell Gate Bridge from Long Island back to the mainland at the northern edge of the city, which enables trains from New England to proceed directly west. Tubes connect New York with the Jersey side, a vehicle tunnel is in process of construction and plans are now proposed for a traffic bridge over the Hudson which will be an outstanding engineering feat. To take care of the thousands of commuters pouring in and out of the city, subways have been built honeycombing the entire island, greatly relieving surface traffic.

With the growth of the city commercially, centres of education, art and amusement have been created, bringing in its train, beautiful parks and public buildings, such as the Zoological Gardens, the Art Museum, the Custom's House, the Morgan Library, the New York Public Library, the Library at Columbia, the American Museum of Natural History; schools, such as the College of the City of New York, New York University, Columbia University, Hunter College, Fordham College, Manhattan College, College of St. Francis Xavier, Union Theological Seminary, College of Physicians and Surgeons and the Rockefeller Institute; churches of the type of St. Patrick's or the Cathedral of St. John the Divine; monuments on the order of Grant's Tomb, the Soldiers and Sailors Monument, statue of Jeanne D'Arc, and the Washington Arch; amusement places of such fame as the Hippodrome, Madison Square Garden, or any of the many newer theatres; holsteries such as the Waldorf-Astoria, the Ritz-Carlton, or the Plaza; restaurants of such fame as the Delmonico's or Sherry's; and parks of which the city has many, Central Park on Manhattan, Riverside Park along the Hudson, Prospect Park in Brooklyn and Pelham Bay Park to the north of the city.

New York is a city of huge finances, many industries with large total value, the tallest office buildings in the world, large and well known educational institutions, the art, literary, and dramatic centers on this side of the Atlantic, the amusement center of the States—it is a city of great heights and depths—a city of great contrasts.

New York will continue to grow, to expand out in the suburbs and up into the air and her foreign trade will lessen in percentage of expansion but the city for a long time, will be the most important in this United States and probably in the world.

CHICAGO.

Chicago bids fair to become not only the largest city in the United States, but also the world. This city is situated in the heart of our great agricultural, forestry and mineral resources, and on the greatest body of fresh water in the world, the Great Lakes. The Welland Canal around Niagara Falls now has a depth of fourteen feet, but plans and appropriations have been made by Canada, awaiting now similar action by the United States, to deepen it to thirty-five feet, which will make Chicago a seaport, open to ocean going vessels. Then, with an ocean harbor, proximity of natural resources and manufacturing industries, and the railroad center of the United States, it must necessarily mean rapidity of growth.

In order to get from the Great Lakes to the Mississippi river, it was necessary to portage over the area now Chicago and thus it became a fairly well traveled route. Joliet and Pere Marquette went over this route in 1673 and again in 1674. In 1830, Chicago was a hamlet of log houses, with a population of about one hundred persons, engaged in fur trade with the Indians and outfitting the trappers. In 1837 came the Illinois and Michigan canal which gave the city its first big boom and in 1833 came the Congressional appropriation for harbor improvements. Shortly after this came the first railroads, short lines at first which stimulated lake traffic, and then the through lines which enabled the western producer to get his product to market quickly. In 1871 came the big Chicago fire, starting Sunday evening and extinguished by a rain on Monday evening, burning over 2,024 acres of buildings, destroying property valued at $187,000,000 and taking the lives of 300 or more people. A new and much finer Chicago rose from the ashes in a little over two years, a tribute to the spirit of the West. The city grew naturally on the west bank of Lake Michigan until in less than 100 years, it has expanded from a small town of 100 persons to the second largest city in the United States with a population of 3,396,808.

The city is both a great commercial and industrial center. The great mass of raw materials which are produced within a radius of a few hundred miles are concentrated on Chicago as a distributing point. It is the greatest live stock center in the world and the city from which our great slaughtering and meat packing houses carry on their business. The wheat elevators here, cannot be equaled in size and number anywhere else in the world. The Chicago Board of Trade is the great buying and selling organization for wheat and other grains of the country. Other products distributed from here are corn, oats, barley, rye, hay and forage crops, lumber and lumber products, iron and copper ore from northern Minnesota and Michigan and the smaller fruits and vegetables. Then, it also serves as a wholesale and jobbing center for the middle west, as witnessed by the large number of mail-order houses that do a tremendous business.

Chicago is probably the greatest rail center in the world; no east to west line in the northern area of the country but what has a terminal in this city. There are twenty-seven companies and thirty-two main lines and terminals located in the town and it is estimated that 1,500 trains go in and out of the city daily. The harbor facilities are excellent and the yearly tonnage ranks well with many seaport cities.

Industrially the city is very active, has 8,860 establishments and a total yearly product value of $2,485,918,374. Some of the chief products with their values follow; slaughtering and meat packing—$452,571,889; men's clothing—$165,429,346; women's clothing—$42,896,568; printing of books—$126,517,808; of periodicals—$90,702,894; foundry and machine shop products—$91,-

981,082; bread and bakery products—$75,694,250; electrical machinery—$74,114,877; car and steam railroad supplies—$60,013,700; iron and steel (products not rolled)—$50,514,337; and furniture $42,309,167.

One of the reasons for the great growth of Chicago from a civic as well as from an industrial point of view is due to the energy, the push and the aggressiveness of the people who have gone after and accomplished those things which they desired for their city and state. The great park system of 39,154 acres with its 74.25 miles of connecting boulevards, attests to this spirit. There are twenty-four parks with city play grounds, and the city has acquired land outside the corporate limits to provide for future breathing spaces for its fast increasing population. A municipal pier costing $3,000,000 with a huge auditorium was built by the people to house big conventions that come to the city.

The public buildings include the great Chicago Public Library with 650,000 volumes, which cost around $2,000,000, the Newberry Library, that exceeds the Public Library in cost and beauty and the Historical Society building. Among the educational institutions are the Chicago Art Institute, the Chicago Law Institute, the University of Chicago, Northwestern University, Lewis Polytechnic Institute, Armour Institute and Loyola University.

This great city is bound to progress, so thoroughly is it based on the natural factors of raw material, transportation and nearness to market combined with the indominable energy and push of the middle-westerners.

PHILADELPHIA.

The "Quaker City" is one of the World's Greatest Workshops, producing manufactured goods that are sold in both hemispheres. The city is located on the Delaware River and the "fall line," that territory where the harder rock of the Piedmont merges into the softer soil of the Coastal Plain and rivers flowing from one to the other have worn away the softer material and a water fall is the result. These small falls have laid the basis for much of the manufacturing in the area. Philadelphia is a great overgrown town, spread out in three directions with an area of 132.7 sq. miles.

Originally the home of the Delaware Indians, the area was settled by the Swedes and the English (mostly Quakers) about 1680. In the next year William Penn obtained his charter as a proprietor and under his guidance and jurisdiction the town grew rapidly as a grain and lumber market. With the good agricultural background the city prospered and was even with New York City until the opening of the Erie Canal in 1825 but Philadelphia being shut off from the West by the Alleghanies suffered in comparison. The original settlers were artisans of the first class and the textile industry soon started and Germantown, a suburb of the city, was the home of the knitting industry in the U. S. With the discovery of iron ore and the discovery of anthracite coal as a fuel the iron industry developed, which is one of the important manufactured products of the city. The first and second Banks of the United States were both located in Philadelphia in 1782 and 1816 respectively. This city with its old traditions, both in industry as well as the social life, has grown into a great workshop but all the while maintaining these same traditions. There probably is no city where the son follows the footsteps of his father and where industry is carefully protected and handed down from one generation to the next, as in Philadelphia. This has been bad oftentimes in a business way because it has meant stagnation.

The factors that have made Philadelphia a city of 1,931,334 people and a great manufacturing city are the Delaware River with its 90 foot channel, skilled labor, especially the Scotch and English artisans and their descendants, and power consisting of water power, anthracite and bituminous coal. The number of industries are listed at 6,788 and the total value of products $1,537,327,972. Among the leading industries is the textile industry; this city producing more than any other city with 1/9 of the hosiery, 1/3 of the carpets, 1/5 of the hats and ⅛ of the woolens and worsteds of the United States; with values of $77,605,380 for knit goods; $64,453,298 for worsteds and woolens, and $33,785,499 for cotton goods. Iron and steel products comprise the second group of products particularly the fabrication of products, such as Baldwin Locomotives, Diston's saws and tools and Brill's street cars, the largest factory of its kind in the world. Foundry and machine shop products have a value of $51,564,593 and electrical machinery at $31,919,081.

Ship-building is a third important industry, some of the firms being New York Ship Co., Cramp's, League Island and Hog Island. Among the other yearly values are: printing and publishing $75,953,877; men's clothing $57,415,069 and women's $49,807,335; sugar refining $91,759,263 and slaughtering and meat packing $43,886,788. Other industries are oil refining, leather goods, automobile bodies and paper.

The city is not primarily a commercial nor a distributing center but it does have plenty of banking and transportation facilities to take care of the needs of business. The Delaware River furnished an ocean port up to 1910 but the growth in size of our large boats and the sandbar which forms constantly down the river, impedes shipping. At low tide this bar gives a channel of only 29.6 ft. The government is constantly dredging, yet the river fills up. It was in 1912 that the Government switched a number of coaling contracts for its battle ships from Philadelphia to Newport News and Norfolk. In spite of this handicap in 1924 the city had imports to the value of $202,604,289 and exported $106,439,234 worth of products.

Philadelphia has clung to its old, so long, that new buildings come slowly and the show places are the historic rather than the great structures which cost millions, so prominent in other cities. Independence Hall, where the first Congress met and where the Liberty Bell now hangs, is an example of this, situated in the downtown district on Independence Square along with many other buildings of the same period. New buildings of importance include a new Art Museum located at the entrance to Fairmount Park and a new central Library. Fairmount Park, with an area of 3,546 acres and 37 acres of water surface besides 1,200 acres to be added soon, is probably

one of the most beautiful city parks in the United States. The park borders on either side of the Schuykill River and then includes the beautiful Wissahickon Valley which has been kept almost intact in its original natural state with no attempt at making it the least artificial. Other parks are League Island, Pennypack, Tacony and Cobbs Creek.

Philadelphia is a great educational center itself together with the fact that the outlying suburbs are filled with schools of both secondary and college rank. The institutions of higher learning in the city are Girard College, Drexel Institute, The University of Pennsylvania with 13,000 students, Temple College, Jefferson Medical College, The College of Pharmacy and the Pennsylvania Academy of Fine Arts.

DETROIT.

Detroit is indelibly fixed in the mind as the home of the automobile industry and the great growth of this city is due to this one cause. From a city, that a few decades ago was just a hamlet, the town has increased to a position of fourth city in the United States with a population of 1,623,452. The city is located on the Northwest bank of the Detroit River, one end fronting on Lake St. Clair and the other end 18 miles from Lake Erie, giving Detroit one of the finest harbors on the lakes with an 11 mile river front.

Detroit was started, as so many of the western cities were, as a fur trading and outfitting post. The first settlement here was started in 1704 by De la Mothe Cadillac for a permanent post, in order to carry on the trade and to keep up the military prestige of the French Government. As a result he built Fort Pontchartrain, manned it with 50 soldiers and settled 50 colonists around it. During the French and Indian Wars, Major Robert Rogers captured the fort and held it for the British Crown. In 1778 the hamlet had a population of 300 inhabitants, in 1802 it was incorporated as a town, captured by the British in 1812, evacuated in 1813 and incorporated as a city in 1824. The automobile industry has been responsible for the great growth of this city from 1890 up to the present day.

The factors which threw the motor industry to Detroit were in part, the fact that they were already manufacturing marine engines, were making carriages and wagons, had foundaries and machine shops and made a specialty of bronze, brass and copper castings. With these forces, an early start and a host of inventions and promoters in this area, one of our great industries was localized. After 1900, the automobile ceased being in a purely experimental stage and its manufacture became a nation wide industry. In 1921 the industry ranked sixth in value of products as compared with total value of all others. From an industry of 57 establishments in 1899, employing 2,241 wage-earners with products valued at $5,000,000, it had expanded in 1921 to 3,590 establishments, 281,350 wage-earners and a product value of $2,508,665,000. Detroit is the city, producing the largest number of automobiles, having a value in 1921 of $102,896,470 for motor vehicle parts, and $236,758,047 for motor vehicles.

The values of other manufactured goods produced in the city are: foundry and machine shop products, $30,780,669; slaughtering and meat packing $30,176,867; brass, bronze and copper castings, $22,410,124; and engraving and plate printing, $10,565,495

Civically, the city is quite active and new public buildings and park projects are constantly being undertaken, particularly within the last few years. Public buildings and monuments now include the Soldiers and Sailors Monument, costing $75,000; the City Hall in Italian Style, some magnificent office buildings, a new auditorium, a Public Library and an Art Museum. There are 31 parks in the city, the largest one Belle Isle in the Detroit River, with an area of 707 acres and the other large ones, Palmer Park, Clark Park and Voigt Park. The schools of higher education in the city are Detroit University, Detroit College of Medicine and only 25 miles away is the University of Michigan.

CLEVELAND.

No other city in the United States stands out, in civic pride, better and cleaner systems of politics, good living conditions and greater activities of its public men than does Cleveland. The city is located on the south shore of Lake Erie, with easy access by rail and water to the sources of mineral and agricultural wealth which have made the town a great manufacturing center.

This area was a part of the western territory of Connecticut, which was conveyed to the Connecticut State Land Company in 1796. Moses Cleveland was sent out to survey and to establish a new Connecticut in the then western wilderness. Cleveland was fixed as the Capital and the town and streets laid out. For some time there was no increase in population because of the poor agricultural background and no chance for commerce. In 1810 the town had 600 people. However, in 1827 the Ohio Canal was opened up to Akron and then extended to Portsmouth at the mouth of the Scioto River in 1832. By 1830 the population was 1,000 and 6,000 in 1840. Then came the railroads and the lake traffic in iron ore and coal. During the Civil War the great demand for steel products boomed the town and it has kept on growing ever since. The city lies at the break where iron ore from Lake Superior and coal from Pennsylvania must be loaded and unloaded and thus the wheels of industry hum. These natural factors of raw materials and natural resources have made Cleveland the sixth city in the United States in population (878,336) and in the value of its manufactured products.

Cleveland has some 2,256 industries with a yearly production value of $682,948,388. Of the various products and their values some of the following stand out: foundry and machine shops, $46,253,574; bolts, nuts, washers, iron and steel products not of the rolling mill, $39,972,725; electrical machinery, $43,542,579; motor vehicles, $63,359,204; slaughtering and meat packing, $38,764,509; men's clothing, $16,848,289; women's clothing, $25,438,242. 45% of the city's industry is iron and steel and the town also produces 4.6% of the motor vehicles of the United States, ranking after Detroit. Among the other industries are printing and publishing, bread

and bakery products, copper, tin and sheet iron products, hosiery and knit goods.

This city on the Lake is quite active commercially with a good harbor, including a breakwater 5¾ miles long protecting a harbor frontage of 14.2 miles. Seven trunk line railroads pass through or have their terminals in the city and give it ample rail shipping facilities. The roads included are the New York Central; the Pennsylvania; the Chicago, Cleveland, Cincinnati and St. Louis; the Erie; the Wheeling and Lake Erie. Ores, both copper and iron, lumber and grain all comes east and part of it is unloaded at this port, which in turn sends back bituminous and anthracite to the ports at the western end of the lake. Other products dealt in are oats, barley, rye, wheat, flour, cattle and sheep.

The city has 2,428 acres in parks with 44 miles of well paved road, the parks including Wade Park, Garden Park, Edgewater Park,—6,000 feet along the lake front containing 125 acres of playgrounds—and Shaker Lake Park just outside the city limits. The city has twenty playgrounds, four public baths, two municipal dance halls, forty-five baseball diamonds, six football grounds, seventy tennis courts and fifteen skating rinks.

The few notable buildings in Cleveland are the Cleveland Athletic Association, the Young Men's Christian Association, the Cleveland Public Library and the new Auditorium. There are three schools of higher education in the city, Western Reserve, Case School of Applied Science and the John Carrol University.

ST. LOUIS.

The great growth of this city has been due, in large part, to its being central in the United States, where at a point on the Mississippi River, it gets the benefit of the confluence of the Missouri River above the city and the Ohio River below. Again, its location is in the heart of our agricultural belt, the center of many of our natural resources and it benefits by the through lines of traffic both east and west, as well as north and south, most of which pass through the city.

In 1764 Laclede Linquest, a French trader, established a trading post here on a bluff overlooking the Mississippi River which had made the city safe from the danger of the wearing away of part of its territory and the ever constant flood danger. The town's growth was started by the early fur trade with the Indians, this city doing business exclusively at one time with twenty-eight Indian tribes, in open competition. The industry has grown until today St. Louis is the greatest raw fur center in the United States. With the Louisiana Purchase in 1804, the territory came under our jurisdiction. The discovery of iron ore nearby in close proximity to coal, boomed the iron and steel industry until it was thought that it would become the steel center of the United States, but that illusion was shattered with the opening up of the Lake Superior iron mines, taking the city out of line with the major ore and fuel traffic. The city was incorporated in 1823 and today it has a population of 816,048.

The city's industries can be divided into two parts, those relating to manufacturing and those having to do with its commercial and distribution activities. Industrially, the city has 2,470 industries, with a total yearly value of $665,518,816. The products and values include, slaughtering and meat packing $64,221,640; boots and shoes $44,984,050; foundry and machine shop products $27,084,543; steam cars $23,972,324; electrical machinery $16,852,932; motor vehicles $37,890,340; men's clothing $16,811,603; women's clothing $11,847,097; bread and bakery products, $19,716,110; bags (not paper) $12,503,345; coffee grinding and roasting $13,414,646; chemicals $11,296,770.

Located in this central position in the United States, the city soon came to be a receiving and distributing point for raw materials and a jobbing center for the retail trade in the district and the great Southwest. In live stock collection and shipments this city stands third with 1,000,000 head of cattle; 3,000,000 hogs; 268,000,000 pounds of dressed beef and 300,000,000 pounds of dressed pork. One hundred and forty thousand head of horses and the same of mules were shipped from this city with a value of $25,000,000. 26,200,000 bushels of wheat (the fifth city in the production of flour), 25,000,000 bushels of corn and one-tenth of the cotton crop were marketed from this city. At the fur auctions, skins to the value of $60,000,000 were sold and 120,000,000 feet of board lumber was shipped in from the Ozarks and shipped out again. In 1920 manufactured goods to the value of $1,600,000,000 were distributed to the central, southern and southwest areas, including dry goods, boots and shoes, food products, drugs, chemicals and hardware. Lead and zinc in great amounts are taken care of through the distributing channels.

From a civic point of view the city is well laid out and has some very beautiful and costly buildings; the new Post Office costing $1,250,000, the Public Library of white marble, the City and Art Museum and the Missouri Botanical Gardens of 120 acres, including 15,000 varities from all parts of the world are examples. Forest Park, the largest of the fifty-three parks, has an area of 266 acres and the Fairground Park of 128 acres has one of the largest open air swimming pools in the country.

The educational establishments include St. Louis University, Washington University, College of Christian Brothers and Forest Park College.

BOSTON.

Boston, the "hub" of the universe, has the appeal of the historic as well as the commercial. It was one of the centers of early colonial activity and the men from that region had much to do in forming our earlier national policies. The city was settled in 1630 by the Massachusetts Bay Company, who settled on the west shore of the bay and then crossed to the other side where it was higher, for better water and timber. The city got its name from an old Lincolnshire town in England. It was here in 1636 the General Court provided for Harvard College, the first college in the United States. A feeling that the town was getting too independent and that there was too much religious intolerance,

prompted Charles II to revoke the colony's charter in 1686, which was instituted again in 1692 after a bloodless revolution.

The fishing industry with Europe was the main source of trade in the earlier days, supplying the Catholic countries. Then in succession came the acts which caused the Revolution, the Stamp Act in 1765, the Boston Massacre in 1770 and the Boston Port Bill which closed the port to all outside trade. The Revolutionary events followed in rapid succession, Paul Revere's ride in April 1775, the skirmishes at Lexington and Concord, the Battle of Bunker Hill, June 17, 1775, the seizure of Dorchester Heights and the final signing of the Declaration of Independence.

Trade was badly crippled by the Revolutionary War and again by the War of 1812 and the New Englanders turned to something else for their livelihood. In 1814 F. C. Lowell established the first power loom at Waltham and shortly after that the city of Lowell was founded on textiles, a foundation which has lasted even to the present day. Before and during the Civil War New England played an important hand with her anti-slavery agitation, led by William Lloyd Garrison. On November 9–10, 1872, a great fire wiped out 776 buildings, 2,000,000 square feet of area with a loss of $75,000,000 and when the fires subsided a newer and a better Boston was built in its place.

Boston is the center of this great manufacturing area within a radius of fifty miles, where 25% of the cotton industry of the United States is concentrated, in such cities as Fall River, New Bedford, Lowell and Manchester. They manufacture 45% of the boots and shoes of the U. S. in Lynn, Haverhill, Brocton, Boston and Manchester. Clothing, organs, and pianos are made in this district also. Boston is the wholesale wool center of the United States, besides being the center of these other jobbing activities. Boston's port is excellent and ranks next to New York. Boston imported in 1924, goods to the value of $253,851,533, a good part of which was raw material, and exported goods worth $57,355,646. The population is now 770,816.

Boston's points of interest are as in Philadelphia, historical rather than the ornate type. Christ's Church (1723), Fanuel Hall (1742), Old State House (1748), Kings Chapel 1749), Old South Meeting House (1792) and the Bunker Hill Monument all attest to this point. The more modern buildings are the Museum of Fine Arts, the Copley Square Hotel, the famous Boston Public Library and the Widener Library at Harvard.

Boston has 3,574 acres devoted to parks. Included in this area are the far-famed Boston Commons and the Public Gardens, situated in the heart of the city. In the lines of higher education there is the New England Conservatory of Music, Boston University, Massachusetts Institute of Technology, Lowell Institute and Harvard University.

The downtown district of Boston is badly congested, the streets narrow and crooked which are said to have followed the cowpaths of earlier years which makes traffic very bad during rush hours. Boston's future is at least uncertain. Her only factor in industry left now is skilled labor and it is a question how long she can keep that as the cotton trade is fast moving south, the woolen industry is scattering and the boot and shoe industry is going west—all nearer the source of raw material and the market.

BALTIMORE.

Baltimore is a great city located at the commercial head of the Atlantic seaboard on Patapsco Bay, an arm of the Chesapeake, 174 miles from the Atlantic Ocean. The city has a natural harbor of twenty-four foot depth which now has been dredged to thirty-five feet. The water power from the "fall line" has helped decidedly in getting industries started.

The first settlement was made on the present site in 1662. The province of Maryland was founded in 1534. Charles Calvert was made governor of the province and small settlements grew up all along the bay. Looking for a central site that would allow growth, the present location of the city was picked and the Colonial Assembly in 1729 passed an Act to lay out the town. The Revolutionary War brought much prosperity to Baltimore due to the crippling of trade in other ports farther north. It was during this period that the famous Baltimore clipper sailed the seas and dominated trade. The British attempted to capture the city in 1814 but were repulsed and it was during that night of the repulse that Francis Scott Key wrote the Star Spangled Banner. During a good part of the Civil War the city was filled with regiments passing through and the town was constantly under martial law. The city has grown from the small number of 5,934 in 1775 until today when it has 859,100, the seventh city in the United States.

Baltimore's industrial and commercial growth has depended upon some of the following factors, the water power from the "fall line," a good harbor at the head of a large and branching bay, the agricultural products from the fertile Piedmont and the sandy Coastal Plain, and its location and nearness to Pennsylvania and West Virginia coal.

The industries are many and diversified, 2,033 establishments with a total yearly product value of $469,508,296. Among the leading industries with their values are: Men's clothing, $47,729,947; women's clothing, $12,675,419; slaughtering and meat packing, $32,056,367; bread and bakery products, $16,933,790; fertilizer $18,810,570; foundry and machine shop products, $17,031,784; tinware, $15,258,660; printing and publishing, $22,329,387; straw hats, $6,441,771; (the greatest straw hat manufacturing city in the United States) and men's furnishings, $17,324,958. Besides these major industries there are many others, canning (first city in the United States), sugar refining, paper manufacturing, flour milling and cotton duck (ranking first in the United States).

Commercially the city is very active due to its seaport position, its central location on the Atlantic Coast and its good transportation facilities. The city is a great center for the flour and wheat trade, second to New York in the receipt of flour and surpassed in bushels of wheat only by New York and Montreal. In the export of flour and grains the city is only exceeded by New York. Other food products that Baltimore acts as a clearing house for, are corn, potatoes, tomatoes and truck products. The exports in-

clude copper, cotton, iron and steel, oats and tobacco and the imports include manganese, nitrate of soda, copper ore, tin, oil, molasses, licorice root and wood pulp. The total value of imports in 1924 was $100,494,922 and exports $100,171,916.

As a distributing center Baltimore looms up, including in its business 1,000 wholesale and jobbing houses; 350,000 accounts in the South alone and the annual jobbing trade averaging $400,000,000 with commission business at least $175,000,000. The products distributed are dry goods, notions, clothing, millinery, boots and shoes, drugs, groceries, food products, hardware and confectionery.

Among the more important of the public buildings and parks are the City Hall of white marble costing $2,400,000, the Post Office in Italian Renaissance, the Wallen Art Gallery, Druid Hill Park, Clifton Park, Patterson Park and Caroll Park. The educational institutions include Peabody Institute, Morgan College, Goucher College, Baltimore City College and Johns Hopkins University.

PITTSBURGH.

This city is better known as the "Smoky City," the "Steel City," or the "City of Hills," titles which it well deserves. Pittsburgh is an industrial town, created through nearness to coal, coke, limestone, iron ore and good transportation, and due to the confluence of the Monongahela and Allegheny rivers to form the Ohio, the city was located at the point of juncture. The surrounding area is of horizontal sandstone structure and the eroding forces have caused these great number of hills and valleys which make building and local transportation difficult.

The territory around Pittsburgh was originally claimed by the French through virtue of the explorations of La Salle but at the same time Virginia insisted that it was a part of the territory granted to her. In 1749 the French army occupied the area and stayed that winter at Venango, Pa. The Virginians sent George Washington to warn the French and also to build a fort. The fort was started the next year but the English were badly defeated and Fort Duquesne rose in its place but that, in turn, was captured by the English in 1758 and burned. A new fort was raised, Fort Pitt, by General Forbes, who had defeated the French and the town of Pittsburgh was laid out around it in 1764. In 1794 the village was incorporated as a town and in 1816 a city. With the discovery of oil, coal and the Lake Superior iron ore, Pittsburgh developed rapidly until now it leads the world in the production of steel.

This district produces 48% of the coke of the world, 10% of the bituminous coal of the world, and a great deal of natural gas and petroleum. The city has 1,694 industries and a total yearly value of $393,430,540. The industries with values are: iron and steel (rolled products), $71,886,789; foundry and machine shop products, $29,111,178; iron and steel blast furnace products, $110,886,789; iron and steel bolts, nuts, washers, not made in rolling mill, $13,429,783; pickles, preserves and sauces, $20,527,635 (Heinz's plant, the largest establishment of its kind); and slaughtering and meat packing, $30,352,649. Beside these, Pittsburgh stands out as the greatest glass city in the world, producing plate, window and all kinds of glass lighting fixtures due to the sand in the Juanita Valley and the eastern section of Ohio and the natural gas from Pennsylvania and West Virginia. 90% of the World's radium is extracted in this city from ores shipped in. The Westinghouse Manufacturing Co., employs 35,000 men, and is one of the largest single establishments in the city, producing airbrakes and all kinds of electrical equipment. The city manufactures aluminum, brass-ware, copper, bronze, corks (the largest plant in the work), sanitary and table ware and the refining of oil and it has been estimated that 46% of the materials for the automobile industry, 44% for the agricultural implement industry, 45% for the hardware industry and 37% for the machinery industry are made in this city.

Traffic on the Allegheny, the Monongahela and the Ohio Rivers was, a couple of decades back, very large, then it took a slump but now the steel mills are shipping huge amounts down the Mississippi on barges to the various ports along the way.

The city has many educational institutions. Mellon Institute, Duquesne University, Pennsylvania College for Women, University of Pittsburgh and Carnegie Institute of Technology, are among those of first rank. Among the public buildings are the Carnegie Institute, a building covering 6 acres and housing a library, an art gallery of pictures and sculpture, a museum of National History and large auditorium with an endowment of $30,000,000 to carry on its work, The Masonic Temple, Memorial Hall, The Pittsburgh Athletic Club, St. Paul Cathedral and Calvary Episcopal Church, the latter considered to be one of the finest pieces of Gothic architecture in the country.

The industrial future of the city is still a matter of doubt. The city's greatness was builded upon natural resources and those resources are diminishing. The city can't expand under the present situation and it seems as if it must lose its place in the scale of cities. However, it was still tenth in size in 1940 with a population of 671,659.

LOS ANGELES.

This noted city in Southern California is far famed as a winter resort and is located in one of the two most fertile counties in the United States, Lancaster, Pennsylvania being the other one, and is not far from the great petroleum industry of that state.

The city is growing fast as a manufacturing city with a total of 2,210 establishments and a yearly product value of $313,589,985. Some of the more important products and values follow; slaughtering and meat packing, $20,569,745; motion pictures, $31,595,817; foundry and machine shops, $19,388,039; cars and general shop construction, $14,907,783; printing and publishing, $19,683,846; tobacco, cigars and cigarettes, $13,431,263; lumber mill products, $12,912,315; furniture, $11,551,095; copper, tin and sheet work, $11,055,132.

Commercially the city markets and ships citrus fruits and petroleum. The California Fruit Growers Association is famous throughout this country for the splendid advertising and excellent

methods of handling the distributive side, which has built up for them tremendous sales.

Los Angeles is fifteen miles from the Pacific and desiring a harbor, one was created at the mouth of the Los Angeles River by the government at a cost of $3,500,000, with a breakwater 2½ miles long. The harbor is municipally controlled and owned, including the 2½ miles of municipal wharfage. The fruit and trucking industry has led to much canning and drying. Sugar beets, beans, deciduous fruits, walnuts and grain are the principal crops of this area.

The appeal of the climate, the atmosphere and the scenery have been a huge factor in the fast growth of the city. The locality covers an area of 3,511 square miles and is one of the most beautiful residential sections in this country. The city has twenty-five public parks, covering 4,000 acres and is the seat of the University of Southern California and Occidental College. In 1940 it had a population of 1,504,277.

BUFFALO.

This city has developed due to the break in transportation from rail to water or vice versa. The Niagara River tumbles over a rock ledge 160 feet in height and thus closes transportation to Lake Ontario, so that all the commerce going East must be unloaded at the eastern end of Lake Erie for New York, Pennsylvania or New England. Buffalo thus started and developed as a manufacturing city.

This area, where the city is today located, was the hunting and fishing ground of the Indian tribes. In 1687 Baron La Houtan recommended it as a site for a fort and a center for the fur trade. Two of the eastern colonies claimed it, New York under a grant of Charles II and Plymouth from a charter signed by James I. As a result of the controversy the Holland Company was given rights to the area. With more trade the town increased and in 1810 the place was incorporated. In 1810 the town was burned by the British, and was rebuilt again in 1815. The Erie Canal, connecting Lake Erie at Buffalo with New York City through the Mohawk Valley and the Hudson River was finished in 1825 and the town boomed, the increase in population within five years was from 2,000 to 8,000.

The factors for manufacturing in Buffalo are power, coal from Pennsylvania and electric power from Niagara Falls, nearness to raw material, the agricultural and mineral resources of the Middle West and good transportation both by boat and rail. The city has 1,513 establishments with a yearly value of $431,383,131. The products are: flour milling, $56,036,758; foundry and machine shop products, $23,316,580; iron and steel from the blast furnace, $9,044,430; motor vehicles, $42,295,420; slaughtering and meat packing, $35,807,251; car and car repair shops, $13,422,089; chemicals, $10,818,490; lumber and beaver board products, $4,951,767; and enameled ware $3,585,032. Other products are fabricated iron and steel, such as the products of the American Radiator Company and the great aluminum, graphite and carborundum industries which have developed with plenty of cheap electricity.

Buffalo, located at this eastern end of Lake Erie, ranks as one of the great ports of the United States, shipping yearly over 25,000,000 tons of grain, flour and provisions, huge numbers of horses and sheep, large quantities of fish, and a great deal of lumber, iron ore, copper and coal. In 1940 it ranked fourteenth in size with a population of 575,901.

The parks, of which there are six large ones, comprise 230 acres and have 28.46 miles of boulevards. The larger parks are Delaware Park, the area of twenty acres around the State Hospital, and Humbolt Park.

Of public buildings and monuments little can be said except to mention a few of the better ones, the huge marble shaft to William McKinley, the Buffalo Historical Society Building with an estimated cost of $2,000,000, the Federal building and the Albright Art Gallery. Three schools of importance should be mentioned, the University of Buffalo, Canisius College and the Fine Arts Academy.

SAN FRANCISCO.

San Francisco is located at the back-door of this continent, one of the key cities to our future trade with the Orient, in the center of one of the richest agricultural regions in the country. San Francisco is situated about 600 miles northwest of San Diego and approximately 865 miles by water from Seattle.

Under Spanish regime, the city was called Yerba Buena. The city was firmly established in the autumn of 1769 upon the founding of a mission and a presidio, representing both the military and religious authority. In 1846, when really only a Mexican village the place was taken over by the United States. Two years later gold was discovered by James W. Marshall and the town went through the boom stages of a gold rush with exorbitant prices and high rents, neglected business, trade waned, ships rotted at the wharfs and a general lawlessness crept in. The rush subsided within a few years and the city returned to normalcy and trade. The town was incorporated in 1850 and in 1851 was made a city.

The agricultural regions around and back of the city began to develop, the silver mines of Nevada began to pour out their treasures, the transcontinental railroads were finished and the East was connected with the West by telegraph and telephone. Couple these factors with an excellent harbor and facing the Orient, no city could help but develop. In 1906 came a great earthquake and fire, demolishing 28,188 buildings covering an area of 497 city blocks, killing 500 people and doing damage estimated at $1,000,000,000.

The city is more commercial than industrial, as is true of all west coast cities. The city is situated on San Francisco Bay, ninety miles long and five to fifteen miles wide, having a surface of 450 square miles with a shore line of 300 miles. The entrance is through the famous Golden Gate, a narrow strait separating the Bay from the Pacific Ocean. The manufactured products with values are motor vehicles, $21,594,871; coffee and spices, $21,465,506; slaughtering and meat packing, $17,417,652; bread and bakery products, $15,119,595; printing and publishing, $29,750,097; ship building, $12,114,825 and tinware, $8,330,808. Other industries are the can-

ning of fruit and vegetables, the refining of sugar and the building of ships. There are 1,986 manufacturing establishments in the city with a total yearly value of $327,499,417.

The city stands fifth in the United States in imports, most of this trade coming from the Orient,—Japan, Australia, New Zealand and the Philippines——where there exists potential markets of 400,000,000 people. The list of imports include rice, sugar, coffee, copra, tin, vegetable oils, and silk and the exports, canned goods (fruit and salmon), raw cotton, iron and steel, fuel oil, leather and lumber.

After the great fire, extensive plans were made for a civic center and a bond issue of $8,000,000 was raised, half of it was spent on a City Hall, a Public Library, and an Auditorium, all of these being grouped around a central plaza. Other buildings include the Hall of Justice, the Palace of Fine Arts, and the Mint. The city has 32 public parks covering 1,400 acres including the famous Golden Gate Park stretching from the center of the city down to the shores of the Pacific, with magnificent boulevards all the way. In 1940 the population was 634,536.

MILWAUKEE.

Milwaukee, the largest city in Wisconsin, is located on the west shore of Lake Michigan, with an area of twenty-six square miles, is eighty-five miles north of Chicago, and has a population of 578,249. The city has developed as a manufacturing and shipping center for the products of the interior.

The first permanent settlement was made in September, 1818, by L. S. Juneau, who received grants from the Indians. The location was a commercial outlet for the interior and thus, as the territory opened up and trade developed, the town progressed. It was incorporated as a town in 1838, and as a city in 1846. In 1840 the city had a population of 1,717, in 1900, 285,315 and in 1940, 587,472.

The advantages of location are water transportation and nearness to raw material, consequently the manufactured products follow very closely that lead and include the following with their values; foundry and machine shops, $33,-851,969; knit goods, $32,073,463; boots and shoes, $22,557,380; slaughtering and meat packing, $25,777,286; electrical machinery supplies, $13,688,286; clothing, $11,478,929; motor vehicles, $9,969,913 and lumber, $5,146,208.

The principal product received from the East is coal and the goods shipped in and out are flour, wheat, corn, oats, barley, rye, and lumber.

The park area covers ninety-four acres. The public buildings of any note are, St. Paul's Church, the Jesuit Church of the Gesu, the Post Office and the Public Library. The schools are Marquette University, Milwaukee Downer Seminary and Milwaukee Downer College

WASHINGTON, D. C.

The city of Washington is without doubt the most beautiful city in the United States and one of the finest in the world, with the great number of public buildings, its magnificent parks, the absence of slums, the exclusive residential districts and the six hundred miles of streets, lined with trees on both sides.

In 1790 Congress appointed a Commission to select a site for a capitol, the present location was chosen and the seat of the Government was moved from Philadelphia to Washington in 1800. In 1814 the Capitol, the White House and other governmental buildings were destroyed by the British. In 1871 a territorial form of government was instituted whereby Congress passes all laws and collects the taxes for the area, the people having no say in local affairs. The city has no industries except those that are necessary to take care of the immediate needs of the population, such as bread and bakery products, printing and publishing and slaughtering and meat packing.

The fact that the seat of our National Government is here in Washington has meant the natural gravitation of a large number of public buildings, not of a political character to this city. The most notable building in the city is, of course, the Capitol, which covers 153,112 square feet, is 350 feet high, cost $4,000,000 to build, and houses the two great legislative bodies, the House in the south wing and the Senate in the north wing along with the Supreme Court, and numberless private offices and committee rooms that take care of the business of the Government.

The White House, the home of the President, down Pennsylvania Avenue can best be described in the words of another as,—"That distinguished little white building." Some of the others are the Library of Congress completed in 1897 at a cost of $6,347,000; the National Library with 2,200 000 volumes; the Treasury Building of pure Greek design made out of freestone and granite at a cost of $7,000,000; the Lincoln Memorial of white marble and one of the world's purest architectural gems; the Washington Monument, a shaft of marble blocks sent from almost every country in the world, 555 feet high; the new Corcoran Art Gallery; the Red Cross Building; Continental Hall built by the Daughters of the American Revolution; the beautiful Pan-American Building; the Union Station; the Post Office and the National Cathedral, now in the process of construction by the Episcopal Church, to be a really national religious shrine. President Wilson was buried in this Cathedral.

The Mall is a great park bordering in part on the Potomac River where are planted the cherry trees, the gift of the Japanese nation and which in the springtime makes one of the most enchanting spots in the world. The other parks of note are Rock Creek Park of 1,609 acres, the Zoological Park 166 acres and Potomac Park.

The educational institutions are many and include, Georgetown University, George Washington University, Howard University (colored), Catholic University and the New American University of Research. The population in 1940 was 663,091.

NEW ORLEANS.

Most important city of Louisiana and metropolis of the Gulf States, located in Southeastern part of the state on the Mississippi River and Lake Ponchartrain, 110 miles from the mouth of the river. The city was originally built along a bend of the river and became known as the "Cres-

cent City." Completion of the Inner Harbor Navigation Canal in 1923 added 11 miles of water front for shipping facilities. This canal extends 5 miles from the Mississippi River to Lake Ponchartrain, which has been dredged so that ocean-going vessels have direct access from the Gulf of Mexico to the city.

Founded by LeMoyne Sieur de Bienville in 1718, the city was named for the Duke of Orleans, the French regent, and served as the capital of Louisiana from 1723 until after the famous Louisiana Purchase by Jefferson in 1803. In 1849 the capital was moved to Baton Rouge.

The city lies below the level of high tide and is protected by levees 25 or more feet high. The glamour of early colonial days still survives in the annual Mardi Gras. Evidences of French and Spanish influence abound in wrought-iron balconies overhanging narrow streets, while in the old French quarter are dwellings 100 years old, built in the fashion of Southern Europe.

New Orleans, with a population of 494,537, is connected with all ports of the world by over 100 steamship lines. Nine railroads enter the city. Its geographical location makes it accessible to all central United States by water and rail. The harbor is one of the safest in the world, and by 1940 New Orleans ranked 21 among the worlds' greatest ports. It is a leading market for cotton, rice, burlap, cigars and timber.

FOREIGN CITIES HAVING AT LEAST 100,000 POPULATION

(From census or official estimate)

City and Country	Year	Population
Aachen, Germany	1939	165,710
Aberdeen, Scotland	1931	167,259
Adelaide, Australia	1939	322,990
Agra, India	1931	229,764
Ahmedabad, India	1931	313,789

ECONOMIC GEOGRAPHY

ABRASIVES. There are many forms known in manufacturing. Used in scouring and polishing wood, stone and other hard surfaces and substances.

Natural abrasives or abradants include the common grindstone, made from material found in various places, mainly Ohio, New York, Colorado, New Hampshire, and recently the best forms from Arkansas. Diamond abrasives are used in polishing the hardest surfaces, also corundum, a natural form of which is emery, quartz and talc. Ontario furnishes our main supply of natural corundum, while South Africa supplies most of the rest of the world. Natural emery is found in New York, Greece, and Asia Minor. Artificial corundum is made from bauxite, the best of which is mined in Arkansas. Other hard abradants are glass, mineral wool, steel shavings, zinc, gold and tin.

Carborundum, the hardest abradant next to the diamond, is an artificial product first made in 1891. This is crystallized carbide of silicon formed by heating coke and sand in electric furnaces to enormously high temperatures. Combined with several other substances like shellac, rubber, porcelain, carbide of silicon appears under various other trade names such as crystolon, carbolon, and samite.

Softer abrasives are pumice, rotten stone, chalk, rouge, putty in powdered form, sawdust, cloth fibers, and gutta percha, all used chiefly in polishing woods. Clay, bakelite, other forms of treated rubber, and crushed fibers find increasing favor as soft abrasives.

AGRICULTURE. When primitive man found his food supply hard to obtain from nature, he began to lay up in store for times of famine, and to try by using implements to eke out his living. Nomadic tribes once followed the food supply from place to place. Yet as early as 3500 B. C. grains attained high cultivation, as the tombs of Egypt, Mesopotamia, and other oriental lands now demonstrate to us.

Early centuries of farming. Undoubtedly man early learned to choose the best grains, plants and berries for growing better crops. For centuries, however, work was done by man power alone. The American Indian, for instance, did not have the horse until the Spaniards came. Yet in the eastern hemisphere, dogs, horses, sheep and oxen seem to have been tamed by man in early times. Grains found in Egyptian tombs showed a high degree of development.

The Romans developed agriculture, as they did the law and the arts, and left little for the early Christian ages. Methods of farming in Asia have changed very little since the days of Christ, until recently. Saracens introduced rice, cotton, sugar, and peas into Spain, and these, with other domestic crops, reached England in the course of westward migrations.

About 1400 the English looked to Flanders, Italy, and the Orient for better ways of growing things. Merchants and pilgrims brought back many new grains and seeds from their travels in the east. After the fall of the feudal system, lands were more and more enclosed, the soils were improved by drainage, and some rudimentary practice of rotation of crops was attempted. Yet grains yielded little more than 10 bushels an acre, and for centuries little was known about keeping animals free from disease and the effects of poor feeding. By 1500 turnips, clover, fruit trees, hops, carrots, cabbages, cauliflowers, and other green vegetables were transplanted into England, some of them from Flanders. Over a century later, some choice grasses, tobacco, Indian corn or maize, squash, and a few other Indian products were introduced from across the Atlantic.

After 1750 England turned to better methods. Lord Townsend in 1760 introduced a new system of crop rotations for wheat, turnips, barley, clover and other grass. Each farmer had to keep enough cattle and sheep to suit his acreage, to use only a certain amount of artificial fertilizer, and not to sell the manure from his place. Thus, under government fostering farms produced fivefold, and man for once came nearer having all he needed for food. Until this time the fear had been that drouth and pests might cause famine in any season. It was not until in the modern industrial and machine age that any surplus of food became troublesome. Bakewell, in 1750, produced a sheep that could be made ready for market in two years, instead of three or four as formerly.

Early farm machinery. Jethro Tull invented a grain drill (1731) and also used a horse-hoe. Since then some of the important helps to farming have been the Newbold cast-iron plow (1797), Lane mouldboard for plows (1833), Deere plow (1837), Pitts thresher (1834), Marsh harvester (1858), the Locke grain-binder (1870), the combination harvester and thresher (1878), three-wheel sulky plow (1884), combined husker and cornstalk shredder (1885), Babcock cream tester (1890), Hart and Parr gasoline tractor (1902), corn picker (1910), and rotary hoe (1928). These immensely increased production and lower costs per unit of crop. In 1850 it took 50 hours to do by hand labor what machines now do in 12—to grow an acre of corn. Great tracts of land have been opened by irrigation, and the whole west of the United States has been brought into production of some degree. The result has been a great surplus of grains, and recently of corn and cotton. Methods are now being tried to place lands back into forests in cases where they produce at too great labor and cost. One recent attempt of the federal government has been to get people to move from poor land to regions that promise abundance.

Improved farming. Many ways have been tried to improve crops, to make the lot of the farmer more fortunate, and to secure the greatest productivity from the soil. Vast irrigation projects in the western states, also in some isolated eastern and southern regions have reclaimed millions of acres. Forestation has helped to bring back the soil to its former level of fertility. Recent projects include the planting of trees in submarginal areas. Among the plans recently proposed to improve rainfall and to conserve moisture is an immense tree-belt reaching from Montana to northern Texas. Authorities now urge that lakes and ponds be left on the land so that the evaporation will produce sufficient rainfall and so prevent drouths. *Dry farming* has also been greatly advanced of late. Crops like kafir corn, sorghum, alfalfa, and notably durum wheat have been planted in sandy or clay soils. Nearly a third of our wheat crop is durum. Sometimes the land is left fallow for a season or two, while it is covered with something to keep both the hot sun and harsh wind from drying it out.

Federal aid to farmers. More than fifty acts have been passed by Congress to aid the farmer. The Morrill Act was among the first, by which nearly every state, and three territories, have "land grant" colleges, where better methods of agriculture are fostered. Of late, these have become the center of the government administration of farm relief in the various areas. Over 700 colleges and schools teach agriculture of some sort. In 1914 the Smith-Lever Act provided for teaching by correspondence at various centers. The Smith-Hughes Act helped the state provide funds and teachers for local schools. Other legislation: Plant and Stock Quarantine (1912); Federal Farm Loan Act (1916); Grain Standards (1916), to provide for better grading of grains; Agricultural Marketing Act (1929), setting up the Federal Farm Board, which spent huge sums in efforts to raise prices of farm produce; Agricultural Credit Act (1933); and the Agricultural Adjustment Administration (1933) to relieve farmers in danger of bankruptcy, and to curtail production by paying bonuses for reducing acreages in cotton and wheat, and for reducing the stock of cattle and hogs.

Farmers cooperatives. Producing and marketing organizations of the farmers themselves have grown up in many lands. Russia, Germany and India are outstanding examples. Australia, Brazil, Canada, France and New Zealand some years ago tried to stabilize production and stimulate selling farm products. Under the N. R. A. in the United States the various code authorities have led to greater concentration. Australia and Canada organized gigantic wheat pools, managed largely by farmers. Production organizations in Denmark (home of this type of cooperation) have been very effective. Brazil tried, without success, to keep up the price of coffee by destroying eight million bags of inferior grade. Examples in the United States are the 20,000 raisin growers of California, a very successful pool; milk dealers within a radius of 400 miles of New York City; three million farmers in the wheat and corn belt.

Statistics on total production in the world are often hard to obtain. Taking as a basis the figures for the last ten years or more, the average annual production of wheat appears to be 4 billion bushels; of corn nearly the same; oats 250 millions less; barley fully a billion and a half; rice about 200 millions; and cotton average, for the world, about 25 million bales. Europe grows a third of the wheat; somewhat more of oats; three-quarters of a billion bushels of rye; and a half billion of barley. Asia furnishes 450 million bushels of wheat, and 125 of barley. For the United States, the yearly average is two and a half billion bushels of corn (mostly consumed where produced); somewhat less than 830 million of wheat; over a billion of oats; 250 millions of barley; 350 millions of potatoes; about 40 each of rye and rice; 12 million bushels of buckwheat; and 15 million bales of cotton. Horses still total for the world, 100 millions; cattle of all kinds, 550 millions, except sheep, 650 millions; and swine, 250 millions; United States claims 15 million horses; 60 million cattle, of which 24 are cows and calves; 60 million swine; and 50 of sheep. Great Britain has 12 million cattle, and 30 million sheep.

ALLOYS. Any combination of metals is an alloy, save for mere physical mixtures and chemical combinations of the ordinary type. Alloys are made in three ways: 1, fusing together; 2, electrolysis; 3, mere pressure. Often alloys differ from their components. Sometimes they are lighter than the average of their components, and sometimes they change when reheated. They must be combined usually in definite proportions, else results vary not a little. Some alloys are made of both metallic and non-metallic elements. They are of two general types: the pure metal alloys, such as those having iron bases, called ferrous; and, second, all others or the non-ferrous.

1. Ferrous alloys appear in hundreds of combinations, and frequently under a bewildering lot of trade, common or patent names. *Steel* itself is a true alloy of iron and carbon. Before 1910 steel alloys were not very common. Now we have them in rods, bars, plates, tubes, wires, forgings, and in scores of other useful products, increasing rapidly. Nickel and chromium, with steel, are used for crank shafts, axles, and other friction surfaces. *Stainless steel*, made of iron, carbon, and from 1 to 15% of chromium, is used for knives and metal surfaces easy to tarnish or dull. *Manganese steel* resists heat, heavy blows, and the efforts of burglar tools. The *non-magnetic* types can be used for precision instruments and in certain laboratory equipments. *Invar*, made of carbon, manganese and iron, resists changes in temperature as in watch springs, pendulum rods, and other parts normally subject to expansion or contraction. This form of nickel-steel is non-corrosive. *Platimite*, another nickel-steel, is much used in making light bulbs. *Tungsten* is composed of iron and chromium, and resists heat from friction up to at least 700 degrees centigrade. Indeed, the chromium-nickel alloys are becoming daily more useful and important. Various proportions of the components give rise to various trade names. *Tantiron* is made of iron and silicon. *Permalloy*, a nickel-steel, containing about 25% also of iron, is much used for submarine cables. Various combinations of steel and tungsten make tough, wear-resisting, keen-edged tools. Chromium and molybdenum sometimes replace the tungsten in such tools. One of the recent developments in alloys leads to cold-rolled steel and other metals, now promising great utility and economy in manufacture.

2. Non-ferrous alloys. Though not so important as the iron and steel alloys, yet hundreds of compounds are becoming more and more useful. Only a few of these may be mentioned here. *Copper* is the basis of numerous alloys, some of which are metal for pennies, gun-metal, bell-metal, brass, bronze, nickel-silver, and others in varying proportions mainly of tin, zinc, nickel. *Mirror metal* contains one-third tin, *constanten* about 40% of nickel, which in other proportions with copper make alloys that can be worked cold or forged at very high temperatures, and *manganin* has 17% of manganese, less than 2 of nickel, and the rest copper. Bronze, already an alloy of copper and tin, if mixed with phosphorus makes *phosphor bronze*, much used in bearings.

Nickel is combined with iron for boiler plates, with chromium to make rust-proof metal, such as that recently introduced for automobile fenders, and as a base for silver-plated ware or for cheap knives and forks without plating. *Chrome-nickel* compounds are used for window sashes, store fronts, and other "fixtures"; in its qualities it resembles stainless steel alloys. *Monel metal*, used extensively in marine fittings, has 60% of nickel. *Permalloy*, a combination including nickel, made in 1927 by G. W. Elmer, proved to be many times more magnetic than iron.

Aluminum alloys have grown tremendously important in recent years. Some of them are for electric power wires instead of copper, for magnalium used in huge quantities in frame construction work, and especially *duralumin*, for air-ship frames and for cooking utensils. Though platinum has grown much more rare and expensive than gold, it is used for alloys in dental work, for ring settings, with 20% of gold for laboratory crucibles, and as a small component with gold in a new alloy called *rhotanium*, used in jewelry. *Cerium* is used with iron to make pyrophoric alloys. *Frary metal* is made of lead, barium, calcium, and a dash of mercury. Canada has recently produced for cutlery a valuable alloy of chromium, cobalt, and iron. *Tungsten* replaced *tantalum* for electric light filiments, and now it is giving way to *molybdenum*, much used also as a hardener in making steel. Twenty or more "rare earth" elements as yet have not been used commercially.

ALUMINUM. The trade or American name for the element aluminum, not found except in combinations in nature, such as in the oxides like corundum, ruby, and sapphire; in hydrates like gibbsite, bauxite, and others; and various compounds like spinell, chrysoberyl and cryolite. The mineral bauxite is the chief supply, coming mainly from Arkansas and three other southern states, Germany, Switzerland, Norway, Canada, and France. Though known to the Romans in salt form, Humphrey Davy, H. C. Oersted, Bunsen, and others failed to isolate aluminum. Paul Heroult of France and C. M. Hall of America about 1886 succeeded in making marketable aluminum, the latter's experiments leading to the present developments in the United States. The common practice is to dissolve molten cryolite in purified alumina at about 950° C., but the solution has to be electrolyzed. See under *Alloys* for combinations with other metals.

Sheet aluminum is familiar to every one in cooking utensils, vats, aluminum foil for wrappings, covers for bottles, tubes for cosmetics, and many other uses. Aluminum castings are extensively used in automobile parts, radiator tops, magneto bodies, brackets, housings, parts of pianos, typewriters, gasoline tanks, and other objects where lightness is desired, combined with great strength and toughness. Duralumin is now largely used in heavier-than-air flying machines, especially for wings, framework, and containers for liquids. Aluminum paints are used more and more, and aluminum bronze powder has long been employed in the arts. For electrical conductors, wires and insulations, because certain forms are non-magnetic, alone or alloyed with copper, aluminum is quickly replacing the latter alloy. It is especially good for containers likely to be affected by sulphur and its compounds. New processes of coating and hardening aluminum render this product of much greater usefulness when lightness, wearing qualities, and looks are imperative.

ANILIN. See under *Coal Tar Products* and *Dyes*.

ARTIFICIAL ICE. See under *Refrigeration*.

ASBESTOS. This mineral product, now found in several varieties, was known as early as the Roman Pliny, who describes it as "the funeral dress of kings." Commercial asbestos is a tough, infusible, fibrous silicate. It is spun and moulded into various coverings where heat would destroy other substances. Some of the chief uses are for brake linings, gaskets, electric insulations, water and steam piping, and fireproof coverings of all sorts. Canada supplies about 80% of the fiber, with Rhodesia, Russia, South Africa making up most of the remainder. Since 1868 the annual output has risen from 200 to about 240,000 tons. The United States takes much of the Canadian raw supply.

AUTOMOBILE. First was made by Cugnot, a French surgeon (1769); fashioned from a gun carriage and a coffee boiler. Murdock, an assistant of James Watt, ran a road wagon by high-pressure, non-condensing steam (1784); Symington and Trevithick improved, until Evans, the American, drove his mud scow overland to the Delaware, taking it thence by water to the Philadelphia docks (1803). From 1820 to 1833 many steam coaches were made by W. James, J. Anderson, Walter Hancock, and Goldsworthy Gurney, all using steam, which gave way to the period of modern development about 1894. Steam and electric automobiles, in their original forms, are now seldom used, since gasoline has proved more convenient, safer, and cheaper than either. For the mechanism of an automobile, see the article on page 913.

Today the process of assembling an automobile illustrates the wonders of mechanics and efficiency. At first, when automobiles were made by hand one by one, parts had to fit through a system of choice. Now the workman in the factory picks up the first one he reaches, knowing that it will go where it belongs; this is the result of interchangeable parts, as developed in the last thirty or forty years, and especially during and since the World War. Standardization leads to cost reduction. Manufacturers of automobiles, for instance, try to reduce their make to a few fundamentals; the Ford has but two styles of chassis,—the pleasure car and the truck. Upon these quite a variety of bodies are made, but these two are standardized, so that special fitting is not necessary. Precision is absolutely required. Quantity production also reduces time and costs, but few companies make more than a fourth of the parts they use. Tires are made by one firm, brake drums by another, lights by another, ignition by others, the body by one firm, the fenders by another, and so on.

Division of labor. Since the process is continuous, but coordinate in all its branches, different large units must be assembled at one time. Endless platforms move down the shop, carrying the part. On one there is nothing but radiators, and the single man has to do a bit of soldering, or put on a nut, or tighten something. On another conveyor moves the chassis, each man doing his small part as it goes by. The body of the car is made ready at another point or in a different room, and in another the tires are fitted to the wheels. All these collected parts meet at one point, or are united in one department. One car every five minutes has been the record of a large factory. The Ford Company made a record of receiving at the River Rouge docks, Michigan, the ore on Monday, and a finished car was made from the material and delivered to a customer on Thursday of the same week. In the meanwhile, these processes were necessary: Moving the ore to the blast furnace, smelting the ore in the furnace, taking sixteen hours thus far; resmelting, four hours; molding the cylinder blocks, five hours; machining, 44 operations in about three hours; then the assembling in line, and the car is finished on Tuesday about 1 p. m. Then it was shipped to the branch dealer, where it arrived on Wednesday, and was delivered the next day to the buyer,—52 hours after the ore reached the dock. Assembly itself has been reduced to 120 minutes for the single car.

Previous to 1912 one million motor cars were made in the United States. By 1935 the total had risen to nearly 45 millions. From 1923 to 1932 the yearly average was about 3 million; in 1933 it was slightly over 2 million, and automobile registration that year was nearly 23,720,000. With meat packing and oil products, the automobile industry leads in America, being first in 1932.

BEVERAGES. All people have their favorite beverages, fermented and non-alcoholic. Though *tea* was known to the Chinese before the dawn of modern history, it was uncommon in England as late as 1666, having been mentioned first in 1615, in a letter from the Orient to an official of the East India Company in London. This is brewed from the leaves of the tea bush, grown in China and neighboring lands, cured by the natives, and now sold in most of the world.

Teas are known as green or black according to the method of preparing them for market. Substitutes are made from various shells, maté, kola nut, sassafras, and partridge berries.

Coffee, first mentioned in eastern lands before 1400, was introduced into England about 1650, grown in Arabia, Java and the eastern Orient, until introduced into Jamaica, West Indies, in 1718. Now the New World, chiefly Brazil, is the main source of supply. The coffee tree grows from seeds to about 6 to 10 feet high, produces about the fifth year a good crop, which is called "cherries," since the outer covering looks red. The whole is dried and the two beans or berries of coffee are removed; or, as now more common, it is soaked in water several times, and the beans are released mechanically by rolling machines. Chief substitutes are chicory,—which some prefer to mix with coffee,—soy beans, roots, seeds of ochra, and cereals, and there are other adulterants. Of the world supply of coffee, Brazil provides about 69%, the average crop being about 13 million sacks of 132 pounds each. Though 2 million pounds were destroyed between June, 1931, and June, 1933, the supply remained beyond the demand in 1934.

Cocoa or cacao, another popular beverage, is produced from the fruit of trees that grow about 20 feet tall. The numerous seeds, resembling somewhat almonds in looks, are extracted from cucumber-shaped fruit, which itself is edible. They are wet, allowed to ferment a little, dried, screened, roasted, and broken up into "nibs," which later are ground fine. Chocolate is a derivative from cacao. Both are highly nutritive and assimilable. Cocoa butter, extracted from the cocoa nibs, or powder, is largely used in making milk chocolate, first prepared by M. D. Peter at Vevay, Switzerland, in 1876. English milk chocolate contains a high proportion of milk, less its water content. Chocolate, though long known in Mexico, was introduced into England as late as 1650. The annual world production is about one-fourth that of coffee.

Mineral waters occur in nature in alkaline, alkaline-saline, saline, and acid combinations. Of the 10,000 natural mineral springs in the United States, about 900 are developed commercially. Such water results from rain water and minerals of the earth coming into contact, the resulting water coming to the surface through fissures, or drilled holes. Many mineral springs produce water above blood-heat in temperature. Famous springs are those at Saratoga, N. Y., good for skin, nerve, and digestive disorders; Berkeley and White Sulphur Springs in West Virginia; the Hot Springs of Arkansas, Wyoming, New Mexico and California, the rich calcic springs at Waukesha, Wis., and certain ones in Texas which liberate free sulphuric acid. Other states have different kinds of healing waters. Apollinaris is imported from Germany, vichy from France, hunyadi janos from Hungary, and kissingen from Bavaria. The Carlsbad Springs in Czecho-Slovakia have been world famous for centuries.

Carbonated beverages in form of soda waters, ginger ales, fruit syrup drinks, waters flavored with synthetic products, are more in demand in the United States than in any other land. About 1807 the fruit juice carbonated water was prescribed by a Philadelphia doctor for his patients. Carbon dioxid is used to impregnate ordinary drinks, ginger ale having a much higher volume, sometimes four and a half volumes of gas. Natural fruit juices and coal tar derivatives are mainly used to flavor, and sugar or syrup to sweeten, for saccharin is forbidden by most states. Consumption of these beverages has grown tremendously in recent years.

BOOKMAKING. Earliest records are the clay tablets of Babylonia and Assyria, 3000 years before Christ, next came the Egyptian priestly writings on paper made of reeds or papyrus 500 years later, and at last the written scroll of early Christian time. The king of Pergamos in the second century prepared the skins of sheep and calves for writing surfaces, named in his honor *pergamenta*, and finally in English *parchments*. Writing material made from rags was introduced in the tenth century. Before modern printing the monks and scribes of the Middle Ages laboriously copied many long manuscripts on parchment and other materials, and some of these were beautifully illustrated and illuminated in colors by hand. Title pages were unknown. The first of these was printed by Füst and Schoeffer at Mainz shortly after 1460. Gutenberg, with money lent by Füst, had printed a Latin Bible and some smaller works before 1455. In 1477 William Caxton, an Englishman who had been on the continent, brought out in England the *Dictes and Sayings of the Philosophers*, now said to have been the first book printed in our language. Caxton followed this with many others, some rather well printed. Printed cuts appeared first in 1461, paging and headlines in 1470, covers of wood for books about this time, small folio and quarto books about 1500.

Aldus of Venice introduced the type we call *italic* in small books, greatly admired and imitated for a century. Before 1600 pasteboard covers replaced the wooden variety, prices of books became reasonable, paper was improved, and printing became a business, so that by 1750 good books were sold for moderate sums. Pope made great sums from his books, which sold as low as one shilling each. The rise of the novel, and the great vogue of poetry, by 1800 dignified and improved the printer's art. Modern bindings, lettering in colors on the backs of books, and new fonts of type gradually evolved. Certain printing houses became known for a distinctive style of work, like the Kelmscott Press of William Morris, the Doves Press, the Ashendale Press, the Curwen Press, the two university presses in England, and those of DeVinne, Updyke, Rogers, Gillis, and the Grolier Club in the United States. Thus typography at last became both a science and almost a fine art.

Process of bookmaking. If the typewritten manuscript or copy is to be printed in the general form, it is placed in the hands of operators of linotype or monotype machines, which machines automatically cast the type and deliver it in column form on a narrow tray called a galley. If the typewritten matter is to be put in tabular form such as found in the history outlines in this book, it must be hand set. The type is then inked and an imprint or proof is made. These "galley" proofs are then sent to the author for whatever corrections he may desire.

Electrotypes. The galley type is then made into page proof with proper title headings inserted. If this proof is satisfactory to the author, an *electrotype* is then made of each page. This is done by pressing the type upon a wax surface plate so that each letter leaves its impression on the soft surface. The wax mold is then dusted with graphite so as to conduct electricity, connected with the negative pole of a battery or dynamo, and placed in a plating solution where it receives a thin coating of copper. To strengthen this thin copper shell, which is an exact duplicate of the type for one page, the wax is then removed and the back is filled with electrotype metal chiefly composed of lead. Anywhere from sixteen to sixty-four of these electrotype pages are locked in a large iron frame (make-ready) and placed on the printing press so arranged that when a sheet of paper is printed on both sides and folded, the pages will be in proper sequence.

Folding and pressing. When the sheets are received from the presses they automatically pass to folding machines which cut them apart and deliver them in folded sections called signatures, which are compressed in bundles by machinery in order to remove the air and to make each section firm.

The printed pages are gathered in order; the "end papers" and the "fly papers" added, and the sheets or pages sewed together. If the book is illustrated, the plates are arranged prior to the sewing. Certain sections are secured by sewing to cords, tapes, or strips of vellum, the projecting ends of which are used to secure the mass of paper to the cover. After the sewing, and the arrangement of cords, etc., the head bands (which give strength to the back) are affixed, and the actual covering of the book is done by gluing or pasting the material upon the boards at the side and back. The final operation is decoration by "tooling" or "stamping." In casing, two stiff sides and a flexible back are made; the sheets are sewed and glued into the case by canvas glued fast to the back, with projecting strips for attaching to the covers. Decorations consist of ornamental textile material, or impressed patterns without color, or in one or more colors, in infinite variety. See also page 811 in Literature for early development of alphabets, writing, and materials.

BRICKMAKING. The clay obtained is cleared of vegetable soil, is tempered or mixed perfectly by hand, in the "pug mill," or the ring pit. Pressed bricks are tempered by hand; the clay is spaded into a pile with water thrown over it, and the next day it is worked over with a spade, cut through with a "slasher," and spaded again. The pug mill is an arrangement of knives to slice the clay, and a "pusher" to drive it again and again through certain orifices, by steam or horse power. The ring pit has a wheel moving from the outer circumference to the center, thoroughly "working" the clay.

When well worked the clay is molded, dried, and burned in a kiln. Hot air and combinations of air and gas are also used. There are two brick machines—one forcing the clay into molds; the one that sends the clay from the pug mill in a continuous oblong which is automatically cut into bricks, carried to the drying rooms, and later to the kilns. The color depends on the amount of iron in the clay; the Milwaukee brick made from clay with a small percentage of iron is of a light cream color. Buff-colored bricks are obtained by mixing ground chalk with the ferruginous clay. Ornamental bricks are colored by the use of metallic oxids, red, yellow, buff, blue, green, white, black, or brown.

Recent improvements in brickmaking include quantity production by use of large hoppers, scoops, and cranes to handle the material and the finished product. Rapid drying of bricks in "tunnels" or long passages, instead of in the old round kilns, and by humidity driers, have proved successful. The semi-dry process also reduces the amount of water needed in mixing the original clays, and a dry process is being perfected under tremendous pressure which forces the particles together.

Though the common building and paving bricks still lead in quantity production, ornamental face bricks, vitrified and enameled varieties, hollow tile bricks for interior constructions, and many special types of artistic bricks are gaining in popularity.

BRUSH. An instrument, also termed broom, for sweeping or rubbing surfaces to remove dirt, or to apply paint, blacking, etc. A bunch of fibrous matter attached to a handle. Of very ancient origin and of universal use. Materials used are bristles, feathers, whalebone, rubber, hair of camel, Russian squirrel, badger, bear, goat, rattan, and also split cane, broom corn, and coir, the husk of the coconut, which is largely superseding hog's bristles for coarser brushes. The crude form is the paint brush with bristles bound together with twine, and a coating of glue; artist's brushes are made from Russian squirrel and camel hair, forced into a wet quill that contracts on drying and holds them fast. The cheaper scrubbing brushes simply have the bristles or fiber pushed through a hole in a piece of wood, and cemented with glue. The Woodbury process (American) trepans the back, the bristles not going quite through, rendering an extra or false back unnecessary.

Machine assembling and stapling of the bristles, and the use of twisted wire, are now largely employed in addition to the older methods of setting by hand, gluing, or trepanning. Wooden fibers, imitation badger hair, and metal holders have recently been used as substitutes. Scouring balls made of metal filings or shavings are often employed where stiff brushing is necessary. Wire-held bristle brushes are used for cleaning bottles, flues, boilers and other hard surfaces.

The well-known long-handled broom and the whisk broom are essentially American developments made from broom corn, a staple product of the Middle West. The long-handled broom of Europe, made from finely split cane, and considered very expensive, was used mainly on carpets. The American broom is within reach of all. The broom corn is run through machines which grade the fibers according to length; it is tied into bundles to bleach, or be dyed, and is secured to the handle by grouping and winding with wire by hand. Revolving brooms for street use were used in 1835, and the modern carpet sweeper is an evolution in miniature.

BUILDING. There has been a revolution in handling building material during the past few years. Labor-saving and time-saving devices have been introduced; bricks, mortar, etc., are raised by elevators instead of by hod, with derricks and hoists for the heavier bodies. About 1890 steel construction attracted attention in New York, and since then "sky-scrapers" have run riot. What is termed "mild structural steel," rolled to size specified in the form of I-beams, L's, Z's, etc., are riveted together to form a skeleton by the contractor, the cranes and hoists bringing everything to position as desired. As the building progresses the "erecting plant" goes up story by story. For the foundations and floors concrete is generally used, composed of one part cement, three parts sand, and five parts broken stone; it is used for filling in spaces between girders and pillars, and for protecting the steel construction; for which terra cotta, brick, and stone are also used. The problem of these buildings lies in the possibility of incessant vibration cutting off the rivet heads, and in the difficulty of finding by inspection the dangerous oxidation of iron when it occurs.

With the decrease in quantity and increase in price of lumber, various substitutes have been devised. Cement, brick, stone, and other naturally hard substances, besides being used more extensively for frame-work, are taking the place of wood at many points. Window casings, furniture, and other interior fittings are now made of metal. It is possible now to construct a large building with 95% or more of material other than wood. Ornamental cement, brick, metal lath, and reconstructed woods become more popular for houses. Cellulose (q.v.) is also rapidly being utilized in finishing interiors.

BUTTONS. Ancient peoples used thongs, girdles, and other means of fastening clothing. As ornaments, buttons were worn in England shortly before 1400; next loops were added before 1600; and last of all the buttonhole. For centuries the Chinese used buttons on hats as a mark of relative ranks. B. Sanders, a Dane, introduced at Birmingham, England, in 1807 the buttons made of two metal disks, with cloth or felt between them, the edges being brazed over to hold this. Since then buttons have been made by machinery. Sanders' son introduced in 1825 buttons having a canvas instead of a metal shank, and in 1827 manufacture of covered buttons began in Massachusetts. Bassot about 1850 invented a machine to stamp buttons from hoofs of cattle, softened by boiling. Porcelain buttons came into use in England about 1840, and glass ones in Bohemia before that date. Birmingham, England, center of button making, manufactured brass buttons in 1689, steel buttons in 1767, horn in 1777, and pearl buttons before 1850.

Ivory, metal, and horn buttons were made at Waterbury, Connecticut, as early as 1812; vegetable ivory buttons at Leeds, Massachusetts, in 1859; composition buttons at Springfield, Mass., in 1875. Beginning at Muscatine, Iowa, after 1890 huge quantities of buttons were made at various towns along the Mississippi River from "niggerhead" shells found in the water. Celluloid picture and campaign buttons have long been popular. In the two varieties, those with metal or cloth shanks and those with holes drilled in the button itself, scores of other substances have been used as raw material.

BY-PRODUCTS. One of the vital questions which confronted industry was the disposal or use of its waste products. Through the efficiency of modern industry this waste has now become more valuable, in many instances, than the product itself. These are now known as by-products. A few representative examples are here mentioned:

Coal. The new process of coking gives not only a better grade of coke, but gas, coal tar, explosive materials, dyes, chemicals, perfumes, acids such as phenol (carbolic), creosote, pitch, and numerous others. In the old bee-hive coke oven all this was lost. Coal is largely used in smelting furnaces. Not only is the smoke of the coking plant used, but now the smoke of the smelting furnace yields vast quantities of arsenic, trioxid, sulphur dioxid, antimony, lead, and copper. Even from the *slag* of the furnace, which was dumped in great slag heaps throughout the country, we now obtain cement, fertilizers, dyes, and other useful products.

Meat packing. Today the phrase is used that everything except the squeal and the curl in the tail of the hog is used. Here we obtain glue, leather dressings, fertilizer, soap, glycerine, pepsin, gelatine, buttons, sausage casings, and other products. In point of fact, however, there are considerable losses in meat packing—in some departments as great as 20% or more.

Cotton seed. Once a great nuisance and always in the way, the cotton seed now yields many valuable by-products such as cellulose from the fuzz or "linters," felt, twine and rope, meal for animals, hydrogenated oil for use in baking, feed, cosmetics, washing powder, putty, artificial leather, paint, and nitroglycerin.

Lumber. Besides countless articles of commerce, lumbering has given us paper pulp, valuable oils, resins, turpentines, wood alcohol, and acetic acid.

Petroleum. We obtain various lubricating oils, paraffin, vaseline, wax, benzol, kerosene, and gasoline, which was once largely considered waste, and now has become one of the most valuable of products. Even certain medicines such as Nujol and Petrolagar are now made as by-products of petroleum.

Sugar beets. These yield alcohol, potassium compounds, and methyl chloride.

Industry has indeed become so specialized and efficient that the dye industry, once a German monopoly, has become one of America's outstanding industries as a result of by-products. Chemistry is performing marvels in the development of by-products to such a degree that even the humble peanut has been made to yield a score of useful products.

CABLES, TRANSMISSION. Rope and links of metal have long been used as cables to hold objects in place. Electric power transmission cables, however, present other difficulties and methods. These latter are for air, surface, or underground lines for telegraph, telephone, submarine communication, and power transmission lines. Two chief classes are *straightway* and *twisted cables.* Only the latter needs special mention, since the ordinary telephone or telegraph wire is familiar enough to all. Twisted cables are now of tremendous business importance.

Transmission cables usually have three layers or parts: (1) Twisted wire cores; (2) insulation of each separate wire in the group; (3) outer armor or insulated covering. Ocean telegraph and telephone cables have an additional armor of iron wire.

Insulation is of two types: 1. The strands or nests of wire are insulated with a rubber or bitumen material. Often a number of wrappings are used, careful attention being given to diagonals to cover over the joints. Next lead is used as a covering, mainly as protection from shocks or cuts. Finally, in some cases, the whole cable is encased in some other covering. 2. Jute, hemp, oiled paper, or wax may be used as the first covering, but this must be coated with lead or some other insulating material. Then, strips of rubber tapes are bound round the cable, vulcanized to seal the edges, pressed and molded firmly into place, and finally covered with some external coating. Most long, air transmission lines are uninsulated; short ones are treated somewhat as the underground cables are. Aluminum and other lighter wires are now replacing copper and heavy alloys. Sometimes cables are grouped together. One in New York City is composed of three parts, as just described, the lot being covered again with insulating material. Cables are often two inches or more in thickness.

CARPETS. Woven carpets were known in the Orient while Western nations had rushes, straw, etc., to cover the floor. The first carpets of the Western nations were used as tablecloths. A carpet factory was established in France (1607), and fugitive French Protestants conveyed the industry to England (1685). In the United States carpet making began with the old rag carpet; every village had its weaver; even in 1890 there were 854 rag weavers' shops. Axminster looms were established in Philadelphia (1791); Erastus Bigelow of Boston introduced the power loom (1844) for weaving ingrain carpets, and secured a patent for a power loom with a Jacquard attachment for weaving Wilton and Brussels carpets (1850).

Since 1855 Smyrna rugs and carpets have been manufactured on the power loom. Two types are produced, these being pile carpets having a surface of raised loops, cut or uncut, such as Turkish, Axminster, Wilton, moquette, tapestry-velvet, body Brussels, and tapestry Brussels; and the woven ply carpets, of which the three-ply is but little used, and the two-ply or ingrain is in general use. Indian and Persian carpets closely resemble the Turkish type. A linen or cotton chain, a linen filling, and a colored worsted yarn warp are used in making Wilton and Brussels carpets. Tapestry Brussels has a cotton chain, a linen or jute filling, a jute yarn backing, and a worsted warp of a single yarn, on which is printed the pattern in colors. Carpets are also woven in a solid color, and the pattern is printed on it afterwards. Velvet carpets contain more wool than tapestry and the face loops are cut. In moquette the back is of heavy jute and cotton with short pieces of woolen yarn continually cut and fastened to the warp thread to increase the "pile." Axminster is an imitation of Turkish and is made with a linen or hempen warp and a chenille filling. Four warp threads of wool, or three on a soft filling thread, are woven together producing the fluffy appearance. Ingrain or Kidderminster has a flat surface woven of a cotton or worsted warp and a wool filling; the pattern is the same on each side, but with colors reversed.

Before 1900 wide pieces of carpet (upwards of 27 inches) were available only in chenille, art squares, and a few odd varieties. Since then looms have been perfected that weave seamless rugs up to 9 feet or more in width. Wilton, Brussels, Axminster, and tapestry carpets have greatly improved in design and pattern. Axminster is now made with an improved knot (the Ghiordes), which resembles the hand-made oriental method. Oriental rug and carpet designs are also reproduced with fair success by machinery.

CELLULOSE PRODUCTS. Over one-third of all vegetable matter is cellulose, the fibrous cell-walls of most plants and trees. Modern society finds cellulose useful in many scores of familiar products.

Cotton is almost pure cellulose; so is flax. *Wood pulp* made into paper is a common transformation. Unglazed paper treated again by sulphuric acid becomes a *parchment* largely used as a substitute for vellum for diplomas, documents, and ornamental novelties. Drinking cups, towels, yarn, cloth-like matting, bags, waste-baskets, gas mantles, and even neckties are made from some form of cellulose. Manila, sisal, kapok, straw boards, material for papier-mâché, raffia, cereal straws are some other forms.

Artificial silk. When cellulose is treated with certain chemicals as described below, it becomes a pasty semi-fluid mass called viscose. From this product much "artificial silk" is made. *Rayon* is a common name for one important variety. Since wood, a natural product, is the basis of this, it can hardly be called a true artificial, and since wood is a *carbon* product and not a protein substance, it is, therefore, not silk at all. Chardonnet of France in 1884 first made an artificial silk, using nitro-cellulose, alcohol, and ether. A second process uses a caustic soda solution treated with copper oxid of ammonia. The kind that is most used is a result obtained by treating sulphid wood pulp with sodium hydroxid. John Mercer of England in 1844 treated cotton with a solution of caustic soda, shrinking the cloth or yarn by a third. H. A. Lowe in 1889 made the process effective, producing a mercerized silk (really cotton) of remarkable luster.

Celluloid. Hardened viscose is called *viscoid.* From this originates scores of products, the most familiar being celluloid, sold under such names as artificial ivory, pyroxylin ivory, and zylonite. Since ordinary celluloid is highly inflammable, a safer form has been developed by using *chlorid* instead of nitrate with cellulose. Celluloid was first demonstrated by A. Parkes of England in 1855; it was independently discovered, perfected, and named by J. W. and I. S. Hyatt of the United States in 1868.

Uses. Later forms include coloring by use of coal-tar dyes and moulding into numerous attractive and artistic designs. The viscous celluloid can be heated, pressed, and cast into any desired form; the finished product can be cut, polished, shaved, or otherwise treated mechanically. It replaces ivory, amber, agate, ebony, and other natural substances. Among the countless uses are for toys, toilet articles, novelties, boxes, transparent screens, films, dental plates, telephone mouth-pieces, handles for forks and knives, book bindings, frames for pictures and glasses, playing cards, chessmen, curtains, and buttons. Chemical adaptations of cellulose are most valuable and sometimes spectacular.

Cellulose treated in certain ways with nitrates produces *collodion* or the liquid court-plaster, which has also been much used for making photographic dry-plates. Nobel, the eminent Swedish inventor, one day cut his finger. To protect it from infection, he painted it with liquid gun-cotton; this hardened, giving him the first form of collodion. Again, he mixed collodion with nitroglycerine, and so made for the first time a *dynamite safe to use.* Nitro-cellulose has since been used in making many types of high explosives. See article on *Explosives.*

Celanese. More recent combinations of cellulose and certain chemicals are stranger than fiction itself. Cellulose acetate, one commercial form of which is called celanese, makes a fine composition for non-inflammable films; for making artificial hair and bristles; for imitation tortoise shell; for non-inflammable "dope" used to cover airplane wings; and for safety or non-breakable glass.

Safety glass is a three-ply product consisting of two sheets of glass with an acetate or nitro film cemented between them.

Cellophane is an extremely thin cellulose product used as wrapping paper. Lacquers are usually nitro-cellulose products, which can be used in a patented sprayer or "paint gun" for automobile bodies, or for use with a brush as ordinary paint. One of the strangest products of all is print paper made from cornstalks, a recent arrival in the cellulose family.

CEMENTS. The history of various cements is lost in the mists of past ages. Various sorts were known to Greeks, Romans, and to Europe at large in the early centuries. "Roman" cement was introduced into England in 1796, into the United States for the Erie Canal in 1818, and into France about 1825; this is a common hydraulic cement, which dries under water. Portland cement, named from Portland Isle of England, was perfected in 1824. Many other varieties have followed, but all are usually grouped under several headings.

Adhesive cements of industry, commerce, and the home are varied and important. Some common forms are made of skim-milk cheese and quicklime; of rosin, wax, and a little plaster of Paris; of quicklime, Canada balsam, white of egg, and mastic varnish for mending china and crockery; shellac and spirits of wine for small articles; linseed oil, litharge, and melted glue for wood; beeswax, ochre, and Indian red for mending mahogany; brick-dust and rosin for setting knives in the handles; iron turnings, sulphur, and sal ammoniac for making pipe joints liquid and gas proof; isinglass and mastic or other gum for jewelers; and of rice-flour and water for making Japanese cement for papers. Common solder is made of tin and lead mainly; putty of carbonate of lime and linseed oil; glue from hoofs of animals, fish refuse, or by treating starch with caustic soda; and plaster of Paris from calcined gypsum or calcium phosphate.

Lime cements, for use in dry places, are made of limestone burned to drive off the carbonic acid. Lime slaked in water is used as whitewash, and with 2 parts of sand it becomes common mortar, useful only when exposed to air for drying out. Gray lime, less pure than ordinary white, may also be spread with the trowel and given a smooth, permanent finish. Selenitic cement is lime mixed with a little plaster of Paris. Cement made of pozzuolana is much employed in Italy. Other forms containing silica, like trass, pumice, tufa, and slag have various uses, and even slag from coal mines, burned and ground up, has interesting possibilities in making building blocks, roads, and hard surface structures. Gypsum cements, other than plaster of Paris, have been much used in Europe for interior work.

Hard lime cements, though little used in America, have long been famous in Europe. They resemble softer limes, except for the addition of silica and alumina, but they harden under water, and so resemble the Portland and other hydraulic cements. Chlorides of magnesium and other various metal oxides attain great hardness; one form called Sorel cement is used for making carborundum grinding stones, for binding sawdust and other wood products to make monolithic floors, and for making artificial marble and other ornamental stones.

Hydraulic cements, chief of which is the familiar Portland, differ from common lime cements, in that they have a calcareous or argillaceous foundation. Natural *Portland cement* material occurs in varied forms, such as in marls, certain limestones, chalk, and some clays. The original mixture is burned to a clinker and removed when it begins to vitrify. Grinding is most important, for the resulting powder, save for a residue of 5% or less, must pass through a sieve having 30,000 meshes to the square inch,—so fine that special bags must be made to hold it. Demands for Portland and other hard cements are now incredibly large for ordinary building, for reenforced bridges, aqueducts, water towers, swimming pools, monuments, paving blocks, telegraph poles, roads, massive furniture for outdoor use, pillars, moulds for conduits, and in many more artistic forms. From 1918 to 1930 in the United States, the amount of cement annually made rose from over 71,000,000 to nearly 161,000,000 barrels. Much of the cement goes toward making *concrete,* now usually reenforced with iron or steel bars, plates or rods. Concrete is a mixture of cement, sand, and stone in varying proportions from 1:3:6 respectively to 1:1:2, depending on what strength and degree of protection from intruding moisture is desired.

CHEESE. Natural cheese, the coagulated part of curd separated from the whey of sour milk, was known as early as 1400 B. C. The Romans had kinds similar to our Limburger and sage. Now we have over 150 distinct varieties, classed as hard, soft, and semi-soft cheeses. As to composition they are called full cream, skim milk, or filled, which last is really normal cheese adulterated with fats, oils, lard, or synthetic products made from vegetables and seeds. Canada, some European countries, and several states forbid filled cheeses.

Cheddar is the most famous of *hard cheeses;* it forms over

GREAT INDUSTRIES—SILK

1 Silk worms feeding on mulberry leaves. 2 Mating tables for silk moths. 3 Harvesting cocoons from bamboo wattle. 4 Butterflies depositing eggs. 5 Silk cocoons. 6 Picking mulberry leaves. 7 Mulberry orchard-leaves used as food for silkworms. 8 Warping raw silk. 9 Raw silk in bales and method of skeining.

80% of American manufacture. Other old English cheeses are Cheshire, Stilton, Wiltshire, and Dorset, named for the district or town where perfected first. Cheddar making in Somerset was reduced to an exact science before 1800. Other continental hard cheeses are the Dutch, Edam, Swiss schweitzer, French Gruyère, and Italian Parmesan. A few of the European *soft cheeses* are Camembert, Brie, Limburger, and Neuchâtel, some of which depend on bacterial fermentation. Peasants sometimes allow their cheese to "ripen" in caves. America now makes foreign types of some soft cheese, a few of them with varying success, and others like Munster, Swiss, and some other hard varieties besides the familiar Cheddar or American. Some common names for hard cheeses are American Cheddar, Canadian, flats, long horns, brick, young americas, and various trade designations; for softs are cream, Neuchâtel, pot, process, baker's. Loaf cheeses, mostly wrapped in packages weighing from one to five pounds each, have become staples since 1920, so that the annual volume now is upwards of a hundred million pounds, over one-fourth of the total.

Rome, N. Y., started the first common cheese factory in 1851, and by 1900 most cheese was no longer made at home. Now Wisconsin and New York are chief producers. It takes about 300 cows to give milk enough for 8 or 10 cheeses daily, and most factories do not exceed that output, though some go to 20 or more. Besides cooperative creameries and larger production, some other recent developments are blended, mild cheeses, quick ripening by new methods instead of the old one of waiting for the natural process, and the encasing of limburger cheese in tin foil or other wrapping, by which the offensive odor has been reduced to a minimum.

CLOCKS. Date from the sundial, and the clepsydra, of the ancients, the latter being a small vase with water dropping through the lower end, somewhat as sand runs through an hourglass. In the fourteenth century Henry de Vick built the first clock recorded for Charles V of France; working by weights and wheels. The pendulum appeared in the seventeenth century. Clocks are run by the automatic falling of a weight, or by the uncoiling of a spring, regulated by the oscillations of a pendulum.

The works consist of a "train" of wheels, each moving after the other. The axle of a wheel bears cogs on its edge. Where a weight is used, the largest wheel has the string of the weight wound around the axle, and its speed is adjusted to each of the others, the final one being connected with an escapement wheel transmitting to the pendulum the power to swing. The escapement wheel with its 30 teeth revolves once a minute; another wheel revolves once an hour and moves the minute hand; the third revolving once in twelve hours moves the hour hand. A weight governs the striking of most clocks. The minute wheel releases a catch, and the weight on the cylinder runs down a little, forcing a hammer to strike a bell. Two pieces of mechanism, a "snail" and a "rack," determine the number of strokes.

Electric clocks are impelled or governed by the current. In the first the clocks are automatically wound by an electromagnetic attachment; in the second a primary clock is connected with a circuit of other clocks, and regulates or runs them. *Pneumatic* clocks are run by compressed air, the movement of the central clock compressing the air in tubes connected with the system, moving the hands by forcing a bellows at each dial to expand. *Astronomical* clocks are carefully and simply constructed, great care being taken to preserve them at an unvarying temperature, and to protect them from outside disturbances.

CLOTHS. The name is applied to any textile made of wool, hair, cotton, flax, or other fibrous product. The word *clothes*, once the plural of *cloth*, after 1800 took on its modern meaning of manufactured clothing. Three kinds of cotton and woolen cloth are recognized; *gray goods*, the material exactly as it leaves the loom; *white goods*, material after bleaching; and plain *dyed goods*, material after being dyed or colored, and also printed fabrics and raised goods.

Finishing of cotton cloth. Processes differ somewhat for the three types of cloth. *Gray goods* are left without further treatment, or they are sized, stiffened, or calendered. Sometimes they are dampened mechanically; then given a smooth finish on one or both sides by calendering; and finally dried, softened, and stretched. *White goods* may be left untreated after bleaching; or stiffened with some mixture like starch; or so treated on one side alone. They may also be calendered, dampened, stretched and dried. Different mills vary widely in the treatments. Though plain *dyed goods* are given many types of finish, the machinery is less complicated than that for white goods. Damping, stretching, calendering, and drying machines are the chief ones, but cloth for window blinds or for books need special treatments. Different finishes are given by changing the number of bowls for damping, of rolls for calendering, or of cylinders for drying. *Raised goods* like flannels are treated with brushing and lustring machines.

Finishing of woolen cloth. Worsted fabrics require clearer finish since the fibers are longer than other wool types, and the threads are often left untreated; in other wool fabrics, the threads are given a felted or denser effect mechanically. Wool cloths are often repaired by hand to remove slight imperfections in weaving. Next they are given the *wet operations*, which include running over rollers, through which jets of steam are forced, to set the cloth; scouring to remove any grease or other foreign substance; impregnated with a soap solution and run through rollers or "milled"; dried, wrung out, and hence "set"; and, finally, some wools, like velours, have to be treated with acids to remove any excess of vegetable material. The *dry operations* include cutting to make the pile uniform in height; blowing with steam to make the fabric "set" permanently; steaming to raise the fiber up somewhat; raising by mechanical teasles; pressing to give uniformity and luster; and shrinking so that the fabric will maintain its size approximately when it is made up.

COAL. Correctly applied, the name designates various forms of fossil fuels originally vegetable matter subjected to structural changes and great pressure, the oxygen, hydrogen, and nitrogen being gradually expelled until the carbon in increased volume remains. Coal has been produced chiefly from plant matter deposited in swamps during former geological ages, mainly of the Carboniferous period. The change from decaying vegetation to coal has been so gradual that the dividing lines between the various stages are not easily discernible. Coals also contain sulphur in various forms, silica, alumina, and magnesia, the latter three tending to make it incombustible and forming the ash and clinkers. When it contains 90% carbon it is termed *anthracite;* when less it is termed *bituminous* or soft coal. Coals contain gases, principally carbon dioxid, methane, and nitrogen, frequently causing great explosions. (See coal gas and after damp.) Successive stages in the process of carbonization are represented by *peat, lignite, bituminous* and *anthracite.*

Peat is not properly a true coal. It consists of a spongy mass of vegetable matter largely sedges, rushes, water lilies, and other forms of aquatic vegetation. It is extensively quarried for use as fuel and when well dried has a higher heating value than wood though inferior to coal. It is largely used in countries of Northern Europe and especially in Ireland.

Lignite ranges from brown to light black. Careful examination will afford evidence of its vegetable origin. Lignite has a low number of *British thermal units*, the standard measure of heat value, is easily breakable, burns with too much ash and smoke. Much of the coal in the Rocky Mountain region is lignite or semi-lignite.

Cannel coal represents the stage between lignite and bituminous. It is compact, hard, and does not soil. It burns with a long smoky flame and is used chiefly for grate fires and is believed to have been produced largely from the spores of giant fern-like plants.

Bituminous coal is the most important variety of all coal. It is black, soft, brittle, and opaque, and used for steam raising and household purposes throughout the civilized world, having less than 10% ash. Artificial or coal gas is made by heating bituminous or soft coal in closed ovens which process leaves coke, coal tar and ammonia as valuable by-products. From coal distillates are made naphthalene, phenol (carbolic acid), creosote, benzine, naphtha and a number of dyes and drugs. See *By-products.*

Many local trade or geological names are given to coal, but these have little delimiting value except to indicate the source rather than the particular kind. England and Wales have about thirty distinct coal regions, the Yorkshire, Durham, Northumberland, Lancashire, Derbyshire and South Wales being the chief ones; and in Scotland the chief fields being the Fifeshire, Lothian, Ayrshire, and Dumfries. All but sixteen states of our Union have produced some coal. Among the chief states may be mentioned West Virginia, Pennsylvania, Kentucky, Illinois, Ohio, Indiana, Alabama, Virginia. Coal production of all kinds annually throughout the world runs to about one billion and a half tons, nearly 40% of which is mined in the United States. The total world reserve is estimated to be about eight trillion tons.

Anthracite contains the maximum carbon and the minimum volatile qualities. It is hard, does not soil and gives off little smoke, burns with a blue flame but with great heat. The chief anthracite fields are in Wales and Belgium. Pennsylvania produces about 60,000,000 tons annually, practically all being found in seven counties: Lackawanna, Luzerne, Schuylkill, Northumberland, Carbon, Columbia, and Dauphin.

Production. The United States leads first in the production of coal with from 400,000,000 to 500,000,000 short tons produced each year, anthracite representing about 65,000,000 short tons (see state production table). Great Britain stands second with about 40% less production. The coal fields of China and Russia are enormous and will some day be a potent world factor. Contrary to public opinion the supply of coal is unlimited. Consumption is actually decreasing and even the United States has unlimited supplies in Alaska. Unless other uses are found for coal the continual development of the hydroelectric power throughout the country will see a gradual decline in coal consumption. Science will undoubtedly come to the rescue of the coal industry and develop new uses. This already has taken place in the development of hundreds of uses for by-products of coal. See article on *By-products.*

Mining methods in coal fields have shown great improvements. Only in the small individually owned mine is the pick and shovel now used. Cutting, loading, and transporting of coal to the surface is now largely done by electrical machinery. There are three prime methods used in gaining access to the coal vein: *shaft*, *drift*, or by *stripping* operations. *Shafts* are largely used where the veins are comparatively far below the surface. In the anthracite fields there may be more than one shaft in different levels of the vein. *Drifts* are generally used where the coal vein outcrops and is quickly reached from the surface. In both instances passages are properly "timbered" to replace the natural support of the earth. In *stripping* operations huge steam shovels are used to remove the top soil exposing the coal which in turn is ripped off by the steam shovel direct into the coal cars ready for shipment. This is the cheapest method of securing the coal but when immense areas of splendid farm land are devastated in this manner to secure the coal it is in the ultimate end uneconomical.

Accidents in mines have been decreasing steadily. In France the ratio is less than one man per thousand; in the bituminous fields of the United States nearly five per thousand and in the anthracite nearly four per thousand. Safety lamps, treating of dust to make it non-explosive, blowers to remove gases, safety blasting compounds, the use of electricity, and the safety campaigns conducted among the miners have greatly reduced the mortality.

COAL TAR PRODUCTS. Today the chemist is more skilled than any wizard of the *Arabian Nights*. He utilizes products once a nuisance to mankind. Once coal tar refuse left after the making of coke was allowed to flow into the streams, there to kill both the fish and the vegetation. Besides coke and gas, coal now yields up hundreds of products by distillation, many of which are of great adaptability and commercial value. Entire industries are now founded upon what was once troublesome refuse, the chief of which possibly is *coal tar*. Since W. H. Perkin made the first anilin dye in 1856, more than two hundred different substances have been wrested from coal tar. One ton of coal yields 100 pounds of tar, the annual output being 6,000,000 tons, nearly one-half produced in the United States. By distillation or fractionation in air-tight containers or retorts, coal tar gives up eight groups of primary products, the chief being crude naphtha, light oil, middle oil, heavy creosote oil, anthracene, and pitch. Leaving dyes for a special article, we now consider the practical applications of these and their derivatives.

Light oil, which comes from the retort at a temperature of about 110° C., gives up anilin, toluene, benzene (not to be confused with benzine, a light petroleum oil), and xylols. Toluene is extensively used in compounding explosives, and for making saccharine, a substance 500 times sweeter than sugar, but of no nutritive value. Benzene and toluol, as benzol when mixed, make a good motor fuel of the anti-knock type. Benzol is also used as a solvent for varnish, and for dry cleaning of clothes. *Naphtha products* are used in making varnish, rubber goods, and for burning outdoors. Cumarone and indene, heavy naphtha products, are valuable in various resins. Pyridine, another naphtha derivative, is used for solvents, and for making alcohol unfit for drinking.

Middle oil, fractionated at 180°-230° C., yields up carbolic acid or phenol, valuable in antisepsis and surgery, for making picric acid to be used in lyddite, a high explosive. Baser forms of phenol go into different resinous compounds like bakelite. Middle oil gives off naphthalene for making moth balls, for fire-lighters when compounded with sawdust, and for synthetic indigo.

Creosote oil, given off at 240°-300° C., makes valuable preservatives for railway ties, bridges, and other wood substances. When slaked with lime, creosote oils make disinfecting powders; with soap the antiseptic "dip" for sheep and other animals; with sulphur for tanning agents; and alone in dilute form for treating cattle diseases. Light creosote is the basis of lysol, creolin, and other disinfecting products which pass under a variety of trade names.

Anthracene oil, at 270°-350° C., gives off a crystal form much used in artificial alizarin dye. *Pitch*, the last remaining substance to come off from coal tar by fractionating or distillation, has been extensively used for roads, for joints between paving stones, for composition roofings, and for making briquettes from coal dust. Some of the coal tar products,—like toluene, benzene, phenol, and anthracene,—are the starting point or intermediates for the manufacture of about 1,500 different things, there being 300 of the intermediates themselves.

COPPER. One of our common metals, known from primitive ages, especially as our earliest alloy when combined with tin to form bronze, which was so much used in a certain prehistoric period that ethnologists named this the bronze age. Alone it is a brilliant metal, dull red in color, taking on a pinkish or yellowish color when broken and a purplish when combined with iron. In 1850 the world output was but 52,000 short tons; in 1929 the United States alone produced nearly 900,000 tons, nearly four times that of Chile, the nearest in volume. Other producing areas in order of volume are Africa, Japan, Canada, Spain, Portugal, Mexico, Peru, and Australasia. Copper ores are numerous, but only a few are commercially important, such as the combinations with sulphur, with oxygen, and native or almost pure copper ore. Some of the special names for copper ores are chalconite, bornite, enargite (found at Butte, Mont.), cuprite, melaconite (found in the South), malachite, and azurite. Native copper, as found in the Lake Superior region, is from 30 to 94% pure. Ores range from a trace of copper to nearly 80%, the Butte ores having nearly 50%. Open or strip mines occur in Michigan, Montana, and Nevada, where sometimes huge cranes and scoops lift 8 tons of ores and dirt in a single operation.

Smelting and refining copper accounts for the great bulk of total production. Blast furnace smelting resembles that described in the article on *Iron and Steel*. Reverberatory furnace smelting resembles somewhat the other processes described for iron. Copper has to undergo a further purifying by electrolytic means or by some other process, the former in America accounting for 80% of the total refined copper. By electrolysis electricity is passed through a copper sulphate solution from one set of copper plates to another. Impurities and other material are thus driven out. Standards of purity of copper are most exacting, less than 1% of foreign material being allowed, and that mainly oxygen.

Uses of copper. Two main uses absorb nearly all copper in the United States, the electrical trades, and the making of various alloys like those described in the article under *Alloys*, such as bronze, copper-zinc, copper-zinc-nickel, copper-nickel, and a host of others. Production in the world is over a million and a half short tons yearly, of which the United States consumes about two-thirds. In order some important uses are: electrical manufacture, transmission lines of all sorts, automobiles, railway cars, wire and rods for varied purposes, buildings, bearings, valves, and ammunition. Single articles are too well known to be specified.

COTTON. Mentioned in India in 700 B. C., as a product long known there, cotton has literally circled the globe during man's efforts to produce better and cheaper clothing. It was introduced into China about 700 A. D., as a decorative plant, into Japan about 800, Spain before 900, brought to Europe in several varieties by the Crusaders before 1300, found growing in the Bahamas by Columbus in 1492, reported in Brazil by Magellan about 1520, made into cloth in England in 1600, grown in Virginia in 1619, exported to Liverpool from South Carolina in 1764; 3,138 bales grown in America in 1790, 379 being exported, and from then on the chief land staple of the South. Various inventions hastened cheap cotton goods: the flying-shuttle in 1733, the spinning jenny in 1764, the spinning frame in 1769, the spinning mule in 1779, the cotton gin in 1793, and the method of ring spinning in 1832.

Since cotton is the greatest fiber crop of the world, its *commercial importance* is beyond estimate. Production has increased from over 17,000,000 bales in 1902-3 to nearly 25,000,000 in 1932, of which latter total the United States produced a little more than half, with India, Egypt, China, Russia, and Brazil coming next in order. New *uses for cotton* and its derivatives are being discovered year by year. Some of the latest are gun cotton for use in making explosives, as a basis for celluloid and other cellulose products (see article on *Cellulose*), for making webbing, fabric for artificial leather, insulating material for electric wires, airplane wings, artificial silk, paper, window shades, medicinal cloths, collars (instead of linen), and many others. Like the coal tar years ago *cotton seeds* once were great nuisances, having no value or commercial importance. Now they are made into various products, the chief of which are cotton seed oil, from which table and cooking products are made; cotton seed cake and bran for cattle feed; fertilizer and bases for making soap; cellulose acetate and cellulose nitrate, using the linters; oil for lamps used by miners; and for grinding pigments in making commercial paints. Nineteen states produce some cotton, the belt extending north as far as southern Illinois and west as far as Texas, and in New Mexico, Arizona, and California under irrigation methods. Finest cotton once came from the islands just off the Carolinas, but the boll weevil there has reduced the crop; also in the Bahamas, in the South Sea islands, and in Egypt. Attempts are being made to grow new varieties in the United States, in an effort to produce a crop that will resist the weevil and other pests, to eradicate which millions have already been spent.

Preparing cotton involves several processes. Over 150 different kinds and grades are known. Modern buyers sometimes test the plant and its product during the growing season, using chemical and microscopic means. Though 30 gradations are known, *three broad classes* are sufficient to mention here: 1, Long staple, all over 1¼ inches such as Egyptian and Sea Island; 2, medium, all between staple and ¾ inch in length, grown in America mainly; 3, short, all under ¾, Indian chiefly, owing to careless methods of growing. Shorter lengths still are made into cotton waste. *Harvesting* includes picking, ginning, and baling. One man can grow 30 acres of cotton, but it takes five to pick the same area. Mechanical pickers are developing. One worker can gather 150 to 200 pounds daily. *Ginning* is the separation of the seed from the lint, one machine being able to separate the equivalent of 500 bales a season, each weighing 478 pounds. Most of the ginning is done at central stations or

plants. The gin is a machine having sets of saws, 70 or fewer, which revolve 400 times a minute, pulling the cotton away from the seed, which falls into a trough and is carried away by mechanical means. Bailing is done by machines in principle not unlike hay presses.

Cotton yarn is now spun mostly by machines, which are the results of many inventions. Spinning is a series of six major operations, rather complicated, but may be roughly described. After the fiber is taken from the bales, it is allowed to expand for a few days; next the impurities are removed; and the material is arranged into boluses or slivers by placing the fibers parallel. The card sliver next makes soft skeins of the cotton; then these are drawn out and compressed, to even up the mass; next they are again drawn, also being twisted, making a much finer mass; and finally three additional processes increase the smallness, strength, and uniformity of the thread. Threads are polished, treated with chemicals, or otherwise perfected in looks and tensile strength.

Weaving cotton cloth is a special process. It is the interlacing of two sets of threads at right angles to each other; the long one is called the warp, the cross one is the woof or weft. Variations occur, such as plaiting, which is arranging the sets in diagonals; netting, tying them when they intersect; looping them as in making hosiery; lacing, or putting one thread through a loop of the other, as in lace. According to coloring and style of weave, cotton cloth is divided into many classes, such as calicos, ginghams, duck, grenadine, lawn, dimity, denim, longcloth, mull, muslin, sateen, piqué, sheeting, shirting, twill, voile, and zephyr. See articles on *Cloth* and *Weaving*.

CUTLERY. Instruments for cutting, such as knives, razors, and their accessories, have developed marvelously in the last few decades. Man has used in succession stones, flint, bronze, iron, steel, silver, and now various alloy products. Sheffield, England, has long been noted for its high grade of steel cutlery of great lasting value. New England towns, mainly in Connecticut, have excelled in this country. Cutlery varies from the thinnest safety razor blade to great butchers' knives and blades used in machines.

Recent developments have included refinements in the type of steel used, the chromium and other alloys that produce a "stainless" knife blade, improved methods of hardening, and machine grinding so that knives hold their edge. Vinegar is the severest test on stain-proof cutlery, for which carborundum or severe polishing wheels and sticks should be sparingly used.

DYES AND DYESTUFFS. Until about 1856 all dyeing used natural products, which were of two sorts, vegetable and mineral. Since then gradually *anilin dyes* have taken the place of most of the old products; these are artificial or synthetic chemicals obtained by the refining of coal tar. Probably the most ancient of dyes is indigo, found in garments of Thebes dating from at least 3,000 years before Christ. The "blue" dye of *Exodus* XXV. 4 was a form of indigo; so the purple mentioned in the Bible and in many ancient works; and the royal or Tyrian purple. Merchants of Tyre sailed on long journeys over the sea to gather myriads of the little animals whose powdered shells made the dye. Today this has been largely replaced by synthetic indigo.

Natural dyes still used somewhat are logwood, fustic, cutch, Persian berries, all vegetable in origin; cochineal, animal in origin; and Prussian blue, iron buff, metallic oxide khaki, chrome yellow and orange, and manganese bronze, all mineral in origin. *Logwood* from the West Indies, used for blacks and browns, still is cheaper, spreads more easily, and looks better than corresponding synthetics, and yet it fades, is sensitive to some acids, and may not be used in some of the more recent dyeing methods. *Fustic* from wood of a tree is also cheap and levels well on long wool; *cutch* from India for browns is still much employed for modifying other dyes; *Persian berries* are most suitable for calicos; and *cochineal*, made from carminic acid obtained from a female insect of Mexico, is still used for dyeing red hunting coats. Favorite once, now obsolete, are Brazil wood for reds; saffron for yellows; lac from an Indian tree, and kermes made from a Mediterranean insect.

The minerals mentioned are used mostly because of superior spreading, fastness, or suitability to vegetable fibers, as khaki for superior lasting qualities under severe tests, like those subjected to soldiers' suitings. Both in variety and color range, natural dyestuffs have great limitations. On the contrary, synthetic dyes have already produced no fewer than 50,000 distinct shadings, tints, and variations according to fabric or proportions used.

Anilin dyes are those made from one of the several results of fractionating or distilling coal tar in closed retorts. Anilin is merely the name of the intermediate from which all the thousands of synthetics derive. It dates from the accidental discovery in 1856 by the English chemist W. H. Perkin of mauve or anilin purple, while he was seeking an artificial quinine product, later actually produced. Next followed magenta (1859), then spirit or rosanilin blues (a great simplification in the process), including Nicholson or water blues still favorites, and finally others in order. Possibilities are still being discovered for new anilines.

Alizarin or synthetic turkey red, once secured from the natural madder, was made by Perkin and also in Germany in 1869, after which 50,000 acres in France for raising madder had to be devoted to other services. Baeyer of Germany isolated anilin indigo in 1880, commercially developed first only in 1897. Amount rose from 4 million pounds in 1900 to 80 in 1913, and now about 100 yearly; while in 1913 the madder production of indigo was but half a million pounds, which has now risen to about 4 millions yearly.

Classes of dyestuffs are made on the basis of composition and uses. All come from the lighter oils, through anilin, after the distillation of coal tar is well under way, as described in the article on *Coal Tar Products*. From a single ton of coal we get these divisions: 12,000 feet of artificial gas; 7–30 pounds of sulfate of ammonia; 1,200 pounds of coke; and at least 100 pounds of coal tar, the basis of dyes and numerous other modern things. Chemical methods vary considerably, and so do the products corresponding. One type is good for cotton, another for wools, a third for felts, and still others for mixed goods, fibers, and so on. Names are legion, one book of a single type for cotton dyeing lists 20 general combinations, and these divide into scores of individual variations of colors—200 yellows, 400 blues and violets, and many others.

One class is called basic dyestuffs, of eight different chemical compositions, including magenta colors, auramine, acridine yellow, indamine blue, Meldola's blue, methylene blue, safframine, and Bismarck brown. In this class fall many of the early discoveries. The acid dyestuffs include the nitros, azos, naphthaline, and quinoline forms, the basis of which is acid, and most are extremely fast in color, durable, and good for leveling. The alizarin dye leads the class of mordants, those which must be used in connection with some fixing solution, such as a metallic salt. These are most suitable for fastness in cottons, wools, and silks of the better class of yarn. Particular ones are alizarin or Turkey red, para red, diamond black, chrome violet, and cerulein. At present the most popular class is the direct cotton dyes, dating from the making of Congo red in 1884, which lacked fastness and was supplanted by benzopurpurine 4B, a name which illustrates how the chemists designate these products, most of which have no common or popular name. Sulphur dyestuffs are numerous and good for fastness and durability. Vat dyestuffs are those into which the fabric is dipped directly, including various indigos and other blues. Azo dyes are peculiar in that the color is formed in the yarn itself, through which at first a carbolic acid (phenol) solution is passed, followed by the diazo solution or a second component. It is extensively used on piece goods, seldom on yarn, and has been a great favorite in Russia for dyeing calicos.

Before 1914 Germany controlled 95% of the synthetic dye industry; but in 1932, Germany made 60,000 tons and exported 25,000, while the United States made 30,000 and exported 10,000 with France, Great Britain, and Switzerland coming next in order. See also the articles on *Explosives*, *Coal Tar*, *Drugs*, and *Resins*.

ELEVATOR. A mechanical appliance to transport passengers or freight to different levels. Usually a car, designed to run at six to eight hundred feet a second, or at any less speed desired. Safety from accident is provided for by clutches thrown into operation when the car exceeds a certain speed, and which stop the car by gripping guides at the sides of the elevator shaft; also by air cushion devices which break the shock of falling. The air cushion device works by making the lower portion of the shaft tight fitting, so that a falling car acts as a piston in a cylinder, and is brought to a slow stop by the compressed air. A car dropping 287 feet did not break eggs, or fracture the electric light bulbs, on stopping. Another device has the air cushion at the top of the shaft; the car carries two grips whose jaws loosely encircle two steel cables studded at intervals with buttons. These cables connect with a yoke carried on a piston-rod and piston working in a steel cylinder. When the car falls it closes the grips on the studded cables and liberates the piston, which, sliding down the cylinder, compresses the air and stops the car.

EXPLOSIVES. Gunpowder was probably the first, and its invention is credited to the Chinese; later to Roger Bacon (1249). Formed by a mechanical mixing of about 75 parts of saltpeter (potassium nitrate), 15 of charcoal, and 10 of sulphur. When exposed it absorbs the oxygen necessary for combustion from the air; when confined, from the saltpeter. Schwartz, a German monk, is said to have originated the use of large grains, increasing explosive force. Percussion caps, invented by Alex John Forsyth, a Scotch clergyman (1807), were followed by brass and copper shells of succeeding periods, Joshua Shaw being the first to patent them in the United States (1842); solid headed shells patented by Hotchkiss (1869).

Gun cotton was discovered by Schonbein (1846); nitroglycerine by Sobero (1847); the former is made by dipping cotton in mixed nitric and sulphuric acids, the latter by treating glycerine with nitric and sulphuric acids. *Dynamite*, patented by Nobel (1868), is nitroglycerine absorbed by inert, infusorial earth, making it safer to handle and use. *Wood* or *white* gunpowder, invented by Schultz (1863),

is granular wood treated with nitric and sulphuric acids, the grains produced being soaked in a solution of saltpeter. *Tonite* (1874-1876) is made from gun cotton and nitrate of barium. *Rackarock* (1881) is prepared from potassium chlorate and nitrobenzene. *Bellite* (1885 and 1891) is ammonium nitrate and nitrobenzene. *Melinite* (1885) is picric acid and gun cotton. *Lyddite* is believed to be substantially the same as melinite. *Cordite* (1889) is made from nitroglycerine, gun cotton, and mineral oil or jelly. *Indurite* (1893) is prepared gun cotton and nitrobenzene. *Maximite* (1899) is composed mainly of picric acid, used in other high explosives, including *Dunnite* (1900). *T. N. T.* (tri-nitro-toluene), much used since first made in Germany (1902), is made of toluene and acids. *Amatol* is T. N. T. and ammonium nitrate.

FIBERS, INDUSTRIAL. Besides cotton, silk and wool, which are noted elsewhere, several fibers are important economically. *Flax* is spun into linen for coarse fabrics, twine, canvas, laces, and finer textiles greatly prized. Flax seed is used for healing inflammations, and the oil for mixing paints. Our Middle West, Argentine, Russia, Belgium, and Ireland furnish the main supply. Russia, the Philippines, and Italy are large exporters of hemp; the United States and Argentine are large consumers. China uses its own supply. *Hemp* and *jute* are used for cheaper grades of rugs and carpets, and for linoleums, and tarpaulins. India exports mainly to the British Isles, Germany, and the United States; Glasgow, Scotland, makes up the raw material. *Sisal* for rope is grown in Yucatan and other semi-tropic places. *Zapupe* promises to be much used as a silk substitute. *Pita* is used for seines, lariats, and hammocks. *Kapok* or silk cotton from Java is extensively used for filling. The panama hat palm fiber is well known; others are coming into use. *Raphia* for cloth making comes from Madagascar. Straws for hats, Spanish moss, bamboo, and ramie or China grass are imported in quantity.

FIREPROOFING. Several factors demand that modern public and large residence structures be freed from fire hazards. Yet in the United States, the loss is nearly half a billion a year from fires, one-half of which are preventable. Laws of cities demand fire prevention, or the use of positive fireproof materials in buildings. For instance, London requires that all stage scenery must be rendered proof from fire hazard; the American Board of Fire Underwriters specifies that ordinary wood must not be used in buildings higher than 150 feet. New York City forbids all such in certain areas. With the decrease also in the available supply of lumber, different building materials become imperative. The loss also from forest fires is almost incalculable, fully as much as from building fires.

Fireproof materials, unknown till 1801 in England, consist of brick, stone, cement, and artificial products. Asbestos of late has come into its own, especially as used by the Johns Manville and Carey companies for pipe wrappings, composition woods, curtains, screens, and many types of insulations. Electric wiring is cased in metal, free from contact with inflammables. Practically no public building and relatively few modern office buildings now have inflammable floors, and many have steel or other alloy window sashes and casings. Even desks in buildings and homes are now made of ornamental steels that look much like fancy woods. Beginning with the old-style iron I beams, with or without coverings of bricks, now the framework of large buildings is made of tempered steel, and all the plastering, cement, terazzo floors, and finishings are impervious to fire. If it were not for advancement in fireproofing, skyscrapers would be impossible. Hollow tiling, ornamental brick work, artistic cement objects now make structures not only safe but beautiful.

Fireproof wood is fairly effective. Ordinary timbers and boards are rendered moderately fire safe by giving them a coating or a bath of phosphate of ammonia, asbestos paint, or other mineral substance. Creosote and other materials are used as antiseptics for wood, and they also retard fires somewhat. Some of the chemicals are forced into the wood under great artificial pressure.

FLOUR. When the name of the grain is not prefixed, the name "flour" indicates a product made from the varieties of wheat. Winter wheat is sown in the autumn and harvested in early summer; spring is sown early and harvested in the autumn. Of the total of flours in America, wheat makes up 60%, corn 30%, and the rest is divided among several kinds of grains and roots. The output of breakfast foods, either in a crushed or ground state, has become tremendous, the chief varieties, besides wheat foods, being oats, corn, rye, and barley. The average wheat crop in bushels in the United States is about 830 millions, three-fourths being made into flour. Buckwheat is utilized in Russia, Holland, and the United States, in the last notably for pancakes; millet is the staple crop in southeastern Europe; durra in China and India; meal of tapioca in South America. Peas, beans, potatoes, rice, and other products of the soil, vine, or tree are often made into flour. Processed sawdust was used in certain parts of Europe during the World War as a substitute in bread, but the world does not take kindly to it now.

Grinding, bolting, or sifting, purifying with air blasts or other means, and bleaching are the chief elements in *making flour*. For many centuries primitive man used stones to grind his wheat by hand, a method still employed in various lands. Then came the two large mill stones, operated by animal power or water. In 1840 iron rollers were introduced at Pesth, Hungary, and in 1868 into the United States. Now huge flour mills use steel or porcelain rollers, in a series of machines or units, each one of which advances the whole process of dividing the wheat berry into several parts. Delaware, Maryland, and Connecticut were once famed for their flouring mills, though every hamlet and town had at least one in early days. By 1800 Wilmington exported 20,000 barrels a year, and Baltimore about 50,000. When the Hessian fly came, the flour industry on a large scale moved westward into non-infected territory. Cincinnati had a flour mill in 1815 and Minneapolis in 1854. Rochester, Chicago, and especially Minneapolis later built huge mills. When Rochester was outdone by Minneapolis, and became the home of a great many greenhouses, the popular name was changed from the Flour City to the Flower City. Richmond, Va., once exported great quantities to South America. In volume of output Minnesota, New York, and Kansas now lead among the states.

Ordinary flours are highly nutritious and digestible, the composition being about 70% of starch, 13% of water, 12% of protein, and the rest cellulose, fat, sugars, and minerals. Wheat flours above all take yeast or baking powder easily, and so leavening is well accomplished, making good bread light and palatable. Milling now carefully separates the five component layers or parts of the wheat kernel. *Bran* is the outmost coat, giving way to two less coarse, then the main starchy part, and within at last the germ or part that grows when the berry is planted. The whitest flour is composed of the starchy part with a little of the third coat. Patent flour, in three gradings, is most highly prized; and next the baker's, so called. *Shorts* are bran and some of the fine flour. *Middlings* are the bran and extraneous material ground up for cattle. Other trade names exist to designate different combinations for man and beast. *Graham* flour is made from the whole kernel without any bolting; that is, without removing any part of the berry. Patent flour takes away both the bran and the germinal part. *Whole wheat* removes a portion of the bran. *Gluten* flour has the starchy part wholly or partly removed, being used for dyspeptics who react unfavorably to starch. Though graham and whole wheat are less easily digested, they are often prescribed for those suffering from sluggish elimination. *Self-rising* flours are those treated with yeast, baking powders, or otherwise to save the user the trouble of adding these in preparing the dough. Common soda crackers are one form of unleavened bread, that is, bread without yeast.

Consumption of wheat in England is over 220 pounds a person every year; in the United States from the figure of 225 in 1879, the total has gradually declined until now it is about 170, due probably to the wider use of fruits and other foods and a more diversified diet today. Though the statistics show that there are still nearly 10,000 flour mills in the land, only a third of these produce quantities large enough to enter into general competition. Recent statistics show that nearly 550 million bushels of wheat are annually made into 120 million barrels of flour, each weighing 196 pounds.

FORESTRY. The conservation of forest products has of late become a world problem. Estimates show that wood is being taken from world supplies at the rate of 56 billion feet yearly, whereas only 38 billion are grown. *Forest reserves* are now estimated at about 7 billion acres or 22% of the land area of the globe, not including polar regions. Of the total acreage, Asia has about 28%; South America, 28; North America, 19; Africa and Europe slightly over 10 each; and Australia, about 4. Russia has, of the total world acreage, 21%; the British Empire, about the same; Brazil, 13; United States, 9; Argentina, 4; Netherlands, 3.4; Peru, 3; China, 2.5; Belgium and Columbia, about 2, and all others less than 2% each. Since 1850 Great Britain has increased its lumber demands by six times, the United States by at least seven, Germany about double, and others in relative ratio. Of the total consumption, fire wood and saw timber are almost equally divided. Though the amount of wood, especially in America, used for fuel is steadily decreasing, and lath, shingles, and several other wood products are much lower in volume than formerly, wood is now used for many more articles. Huge quantities are employed for transmission line poles, railway ties, newsprint pulp, various articles of furniture, and cellulose for several uses.

Timber supply. Once the United States and possessions had a million acres of forest reserves, growing at least 5 trillions of board feet of lumber. The national forests in 1934 had about 160 million acres, 85 million in actual planting or suitable for planting. Annual uses of lumber are about as follows: rough and planed, 13 million feet; mill finished, 5 million; sash, doors, and blinds, about 3 and a third. Nine million feet are used for buildings other than houses; one and a quarter for railroad ties; 380,000 feet for laths; 393,000 tons of bark, small wood, and other by-products for many uses. Once the northeastern states supplied over half the lumber. Recently the South, Rocky Mountain and Pacific

regions have furnished the chief amounts. Today the smallest supply lies in the middle states, then in the north and northeastern states, next in the south, and the greatest in the Pacific. For different woods and their uses, see table on *Woods*, pages 577-79.

Progress in forestry. For fifty years economists have complained that forest supply was diminishing too fast. Though other products have in many cases replaced wood, the need for more forests still remains acute. Forests conserve the soil, hold back the rainfall from running off too rapidly, and temper the climate somewhat. Yet 60% of the world supply receives no scientific care. Shortly after 1900, President Theodore Roosevelt and others, notably Gifford Pinchot, who became the United States Chief Forester, began to urge conservation of all natural resources, especially the trees. New laws were passed, states like Pennsylvania, Maine, New York, Massachusetts, several in the South, and some in the northwest began to restrict cuttings and stimulate growths. Today the Forestry Service is a most important agency. In recent years the ratio of growth to cutting of timber has become more favorable. Uncle Sam's forest rangers are ever on the alert to detect and stamp out fires, but the toll is beyond calculation, as shown by the fact that in Washington and Oregon nearly a fourth of the magnificent douglas firs have suffered in some degree from forest fires. Private initiative has also done much to increase the respect for trees. Tree surgeons like the late John Davey (q. v.) have saved millions of trees in parks and private grounds; and the arbor day movement, fostered by J. Sterling Morton of Nebraska, did much to get children interested in growing beautiful trees. Recent campaigns by the government, the American Legion, the depression and relief agencies, have all tended to make the American more tree-minded. The idea is gaining in favor also that trees conserve moisture, prevent drying out of the land, and render the air about more suitable for growing crops of all sorts. The American farmer begins to look upon a tree as a help, and no longer merely something that prevents him from cultivating a small space of land.

Chief principles of forestry. No longer is the growing of trees left to nature or to chance. Once the birds planted the seeds, or the wind blew them about, and trees grew where seeds lodged and survived. Today many areas are being withdrawn from other cultivation to be put into trees. Foresters are carefully studying how to reduce forest pests, how to conserve soil and rainfall, how to check forest fires, how to cut off the smaller trees to give others a fair chance, how to introduce and cultivate more rapidly growing trees, and how to utilize every part, even to the tip top of the tree for our children at Christmas. Objectives are: 1, production of more woods, more varieties; 2, saving the by-products and every tree, small or large; 3, forest economy, such as planting, fostering, watering, and harvesting our forests.

FUR. The Chinese highly valued furs over 3,500 years ago; most aboriginal people, notably the Indians, especially in cold climates, have used furs as chief articles of clothing. Modern man follows with fur as an ornamental or secondary clothing. Medieval Europe used fur for hats and smaller articles, but had no large supply, the main source being the countries about the Baltic and North Seas. North America soon opened up to new settlers an immense field for exploitation, and the Hudson Bay Company dates from 1670. John Jacob Astor and early pioneers in the United States built up fortunes mainly in fur trade with the Indians. As settlements increased fur trading was pushed back into primitive regions. At present the chief natural supplies from North America are the beaver, skunk, rabbit, muskrat, opossum, mink, marten, ermine, foxes, seal, raccoon, bear, and lynx. Louisiana leads all our states in fur production, largely because of the enormous number of muskrats trapped. The United States exports about 18 million pieces of fur annually. North Europe and Siberia supply squirrel, Russian sable, ermine, various kinds of foxes, marmot, stone marten, otter, and musquash. Moleskin comes from the British Isles, Holland, France, and some from Africa. From Asia the chief furs are marmot, goat, lamb, moufflon, tiger, stone marten, and others. Australia and New Zealand provide huge quantities of rabbit for London auctions several times a year. South America supplies nutria, chinchilla (rather scarce now), foxes, and skunk. Seals from the North and South Atlantic and the North Pacific, since they were placed under international protection in 1898, have grown now to about half a million, a five-fold increase.

Fur farms have become increasingly important. Certain parts of Canada, Minnesota, North Dakota, New York, Louisiana, and other states have developed extensive ranges for producing and marketing furs. Much of the world product is sold at auction to jobbers,—in Europe at London and Leipzig; in Canada at Montreal, Edmonton, and Winnipeg; in United States at New York, Seattle, and St. Louis, the latter being the world center for the Alaska seal catch. Copenhagen takes the Greenland furs; Leipzig those from Russia; and New York those from South and Central America. Paris and Vienna originate style in Europe, with London following with modifications, and New York also adding original touches and creations.

Fur imitation is extensively practiced. Several methods are in vogue: Dyeing, blending, and otherwise preparing a low-grade fur to make it look like a rare one; using names that often confuse, if not deceive, the buyer; and imitating fur from cloth products, this last being easily detected. Real nutria, for instance, comes from one of the rat family of South America, but rabbit and other cheaper skins are dyed in imitation; muskrat may pass for seal; squirrel for chinchilla squirrel of South America; Australian rabbit for Baltic leopard; and muskrat for Hudson seal. Some of the fancy names for furs are Kit cony, leopard cony, bisam mink (muskrat), chinchilette, French leopard, Baltic white fox, nutria, red river seal, Russian taupe fox, ermiline. Certain laws are designed to protect the public against misbranding; in a combination, for instance, often the last name designates the kind of fur and the rest a designation, trade name, or process label. Thus seal dyed muskrat is, of course, a muskrat trying to look like seal; black dyed fox is an inferior fox dyed to resemble a costly one; stone marten opossum is our old elusive friend rechristened; beaver cony, nutria cony, and such names are designations for rabbit, cony being another name for a rabbit.

GAS, ILLUMINATING. William Murdock at Redruth, Cornwall, England, in 1792 made and utilized coal gas for lighting his own cottage, and ten years later for lighting the streets of Soho. Beginning in 1804 various companies sprang up in London; the London Gas Light and Coke Company, survivor of nearly all of them, in 1928 employed 20,000 men and sold 46 billion cubic feet of gas, with by-products of coke of a million and a half tons; coal tar 27 million gallons; ammonia 23,000 tons; and creosote 7 and a half million gallons. For these 2 million 600 thousand tons of coal were transformed.

In America, Philadelphia first experimented with gas, but David Melville lighted his house at Newport, R. I., as early as 1805. Baltimore (1812), Philadelphia (1815), Boston (1822), and New York (1825) were the first large cities to use artificial gas for street lighting. Not until about 1835 in England and 1855 in the United States was this fuel used for domestic cooking. Within a decade ending in 1930, gas consumption grew by 400%, while population in America gained only 16%. Industries use tremendous quantities of both made and natural gas. One Ford plant (River Rouge, Mich.) burns about 50 million feet a day, enough for a city of 5 millions. Even skyscrapers are now heated by gas.

Coal is heated in retorts; the heavy gas driven off passes, by a pipe termed a hydraulic main, through curved pipes or condensers, in which process coal tar and ammoniacal liquor condense and fall into a well. The gas passes to purifiers, over slaked lime, which takes up sulphureted hydrogen and carbonic acid; it is then headed downward to the gas holder, a large tank whose base rests in water, and from which the gas is distributed to the customers. The by-products, today, are stated to be much more valuable than the gas obtained, and include coke, ammonia, anilin, phenol, or carbolic acid, naphthalene dyes, various artificial drugs, and basic perfumes.

Acetylene gas is a compound of two atoms of carbon and two of hydrogen; discovered by Edmond Davy (1836). Its modern method of preparation from calcium carbid was discovered by Thomas L. Willson, a Canadian, in 1893. Calcium carbid is formed by exposing a mixture of lime and carbon to the action of an electric arc. Calcium carbid treated with water gives off acetylene gas, which burns with a dazzling white light; used in isolated places remote from electric or gas lights. *Water* gas is made by decomposing water as steam; its hydrogen is mixed with a heavier carbon gas derived from oil, and the mixture made stable by subjecting it to a high temperature. Its cheapness of production is its chief recommendation; apparently now offset by its lack of by-products. Ibbetson acted on Fontana's discovery (1824) and developed it; first United States experiment tried at Girard House, Philadelphia (1858); process revolutionized by Lowe (1875), who received the Franklin gold medal of honor (1886). *Welsbach burner* improves the quality of gas light and saves combustion. Invented by Carl Auer von Welsbach (1885); being an application of the Drummond light; a mantle of fabric is dipped in refractory earth salts; the flame from mixed gas and air heats the mantle, which glows with brilliant incandescence of pure white quality. *Drummond light* or *Lime light* is a piece of quicklime subjected to the heat from an oxyhydrogen blowpipe, emitting an intensely brilliant light. Discovered by Lieutenant Drummond of England (1826). *Pintsch* gas is made from oil and stored in a highly compressed state in cylinders for ease of transportation. Its chief use is for lighting railway cars. Artificial gas is now stored in tanks for use like acetylene and Pintsch gas at points remote from the source of ordinary supply.

Natural Gas. No development industrially has been more spectacular than that of natural gas in recent years. From a few isolated sources of supply in 1910, now great fields in several states are opened, notably in Pennsylvania, West Virginia, Oklahoma, Texas, California, and Louisiana. Middle western and southern states have shown greatest

development in production. The value of the product is now over 300 millions annually, and the total production is over 1 billion and a half thousands of feet. Ohio, California, and Pennsylvania are leaders in numbers of single consumers. Natural gas heating of shops, offices, and houses, which are remote from good coal supply, has shown great increases in recent years. The total production of the natural product doubled in six years, ending in 1929. Great pipe lines convey it hundreds of miles—from the Kettleman fields to San Francisco; from West Virginia to Baltimore and Philadelphia; and from mid-continent fields to Chicago and St. Louis. States like Nebraska and Iowa, having no local source of supply, are now served by huge lines from the Kansas, Oklahoma, and Texas oil regions. Recent line extensions include Kansas City, Memphis, Tenn., New Orleans, San Antonio, Texas, and Salt Lake City.

GASOLINE. No processes illustrate the trends of modern chemical science more forcefully than the numerous productive treatments of coal, crude oil, and gas, all of them similar in general composition. Kerosene, gasoline, fuel and lubricating oils, and such by-products as asphalt, paraffine, petroleum coke, petrolatum, and medicinal oils are only the chief refinements of petroleum or crude oil. Gasoline in the last generation has come into increasing prominence as a fuel for many types of internal combustion engines. Before the advent of the gas engine, and even until modern automobiles became numerous, gasoline was treated as a waste product from coal oil or petroleum, and it was usually destroyed or thrown away. Technically gasoline is the lighter distillate of petroleum, within the range of .629 and .667 specific gravity, ranging between 95° and 80° according to the Baumé scale, the one used to measure petroleum products. Gasoline in Europe passes under the name of *petrol*, a short form of the word *petroleum*. Once laws had to be passed by states to keep manufacturers from adulterating kerosene with gasoline; but now every effort is made to force out of petroleum the last vestige of gasoline.

Kinds of gasoline. For years the only commercial type of gasoline was that derived from refining kerosene and other petroleum products. This is now called *natural* or *straight-run gasoline*. Since only a part of the gasoline can be extracted from petroleum at low temperatures, this type is now not so common in view of the great demand for more and more of the product. Methods of distillation are quite similar to those for making alcohol, and the apparatus consists essentially of a container for the "crude," a series of coils, usually in part at least copper, and a cooling series at the end, or some means of cooling the vapor and condensing this into the liquid gasoline, the final result of distillation. Gasoline of about 90° is highly volatile, hard to contain, gets through wood with some ease, and so cannot be used to any extent. Another type is *casing-head gasoline*, perhaps better named *natural-gas gasoline*, since it comes from natural gas at the casing head or top of the pipe that conveys gas from the ground. This is highly volatile, is often mixed with much heavier kinds or even oils, and in United States production has increased from over 280 million gallons in 1918 to nearly one and one-half billion yearly of late.

Cracked gasoline has been on the market since 1913, the processes of manufacture for a time being jealously guarded. Though several methods are now extensively used, one of the oldest is the Burton, a patent of the Standard Oil Company of Indiana. The cracking is literally breaking or bursting the composition into different or smaller units. Since gasoline is not a single compound, but a series of related ones, it can be broken up, or the molecules may be rearranged or reduced. Cracking is essentially a thinning process or really a series of processes. Thus, oils may be cracked several times.

The process is accomplished in stills or retorts under various pressures of from 50 pounds up, and at temperatures from 500° F. up. One method consists of having a container lined at the top and sides with steel balls, which get intensely hot and so cause the oil or crude gasoline to be highly vaporized. The resulting product is collected in tanks placed above the still or apparatus. Gasoline, then, is a series of compounds ranging all the way from the lightest, most volatile to the heaviest types or "end-products," beyond which burning in an engine or quick starting is not easily accomplished.

Production of cracked gasoline is at lease one-third of the total at present, the exact amount being hard to estimate. Almost every refining firm handles this type of product. In 1919 the total output of all gasolines was nearly 818 million barrels, and the number of automotive cars was 7 and a half millions. Now the output is mounting toward 600 million barrels, with more than 30 million cars in use.

Anti-knock gasoline. In winter motors need a more highly fractionated or cracked gasoline. Easy starting gasoline is lighter, more volatile; it is sometimes called high compression gasoline or by other trade names. Knocking in the car indicates that the gasoline is being too rapidly consumed; or that combustion is too rapidly taking place for greatest service in pushing the engine pistons. Various conditions affect this, including the type of gasoline used, the mixture of gas and air, presence of carbon in the cylinders, and so on. That greater efficiency is needed is shown by the fact that only a small percentage of the actual power of the gasoline is really utilized in giving power to the engine. Some mixtures of gasoline help engine performance. The idea that straight run or only a single type should be used is now claimed to be erroneous. Benzol, when added to some gasolines, greatly improves the product. Sometimes a small portion, less than one per cent of tetra-ethyl, is added to gasoline to retard the speed of combustion. Several other "anti-knock" compounds are now on the market. The problem will be solved by a more complete removal of the surplus hydrocarbons from gasoline, or reducing the liquid to a state so that every drop may be combusted easily and quickly, but at the same time not too fast for utilization in the engine.

GLASS. This chemical product is normally composed of silica, as found in common sand, soda as found in sodium carbonate (soda ash), lime as found in calcium carbonate; and other products in small degree, including old glass, known as *cullet*. Sometimes oxidizing agents are used, such as sodium or potassium nitrate, or reducing agents, such as carbon; decoloring materials; or coloring or opaque producing materials. These various components (and in certain cases others) must be proportioned accurately. Glass ingredients are first thoroughly mixed, and then molten either in pots or in tanks. Machinery has replaced hand labor in most of the processes, including even the "blowing" of glass bottles and the like. Tanks are of variant sizes and types for different glass mixtures, the tendency being to reduce the size somewhat, and to use pots less and less, because of the economic advantages obtained from the use of continuous tanks.

Glass articles are made in several ways, the chief being these: 1, hand work; 2, blowing in moulds; 3, pressing mechanically; 4, drawing; 5, rolling. Hand work, now almost superseded, is still used in making lamp chimneys, tumblers, and some highly artistic and ornamental glasses. *Moulded glasses* include many common varieties now popular. The operator gathers a mass (sometimes as much as 60 pounds) on a long iron rod. This is blown in the air, next lowered into a mould, which is firmly closed, and finally rotated in the mould if a certain form is sought. Machines now make many types of bottles, formerly blown by workers. The Westlake machine for blowing electric bulbs has 24 moulds with an automatic blowing head or orifice for each. It works automatically, making 120,000 bulbs a day. The Owens machine, an American vacuum blower, will produce with ten arms or units about 30 jars of two pounds each every minute it runs; and by multiple moulds on each arm, the capacity can be greatly increased. Such devices automatically measure the precise amount of red-hot glass needed for each bottle, and a scissor arrangement cuts it off at the right point from the needle or jet of material. Three different designs of machine provide, like the Owens, for arms mounted on a central pillar; or, like the Edward Miller and Hartford, for molds on a single flat table; or, like the O'Neill and Lynch, for two molds—on separate tables—one to make the body of the bottle, and the other to finish it. Of the latter, late types carry at least six parison or body molds and eight finishing moulds in the same machine. After the bottles are cast, they are conveyed by hand or on rotating belts to the annealing leer, which provides for cooling under fixed conditions, the process taking several hours at least.

Pressed glass is made by pouring the molten material into a mould, and after it is properly distributed, an upper mould or plunger is forced or pressed down upon it. This type of simple machine makes glass dishes of all sorts, thick-walled tumblers, reflectors and lenses as for automobile lights, and flat or curved glass of various types. The patterns can be plain or ornamental on one or both sides. Plates are usually plain on top, and ornamented with varied designs on the under side.

Drawn glass is used mainly for common "window" or flat glass and also for rolled or tubing glass. The Libbey-Owens machine draws the flat glass through a machine that sends it through the annealing furnace which is several hundred feet long; so the process is continuous. The machine draws the glass continuously from 19 to 27 feet each minute. Later the sheets are divided into the right sizes. The Danner and Libbey-Owens, both American machines, draw out rods and glass hollow tubes in somewhat similar ways at the rate of 100 to 500 feet each minute; a Holland machine, the Philips resembles these in general form.

Rolled or plate glass, familiar in many uses, is quite a different product from common or so-called "window" glass. The material is melted sufficiently in a molten pot, which is transferred by crane to a casting table, where the glass is poured out evenly. Then iron rollers pass over it, regulated to a certain thickness, usually about one-half inch. Later it is cut, treated, and polished. Plate glass may be roughened or made semi-transparent on one or both sides; or it may be waved; or it may be reenforced with wire for strength. It is superior to other types in clearness, freedom from bubbles, or other defects, and low reflective power as applied to windows. It is used chiefly for mirrors, store fronts, showcases, automobiles, hanging signs, and special constructions. Prism glass is especially made to cast light at a certain point;

it is familiar in the upper ranges of store fronts, modifying or deflecting the light. Wire glass, of various patterns, is made by introducing the wire reenforcement or screen into the molten glass before annealing starts. Curved glass is bent while hot.
